A THEORY OF ORNAMENTAL DESIGN APPLIED TO THE DECORATION OF STOVES.

Color, Sound and Form.

Now, suppose we combine color and sound and apply our minds to the relation of form to this theory, and see what its analogies are. In the beginning it might be well to remember that a constantly widening circle of designers believe that form in effect upon the eye is distinctly analogous to that of sound upon the ear, and that color is simply the sensual side of form, differing therefrom only as the rainbow differs from the mountain crag, and concordantly joining with form and sound, all together marching in the same methodical procession of the gamut—tonic, mediant, dominant and tonic—and with the same constancy to the regular order of intervals in all the major and minor keys, while many go so far as to claim equal susceptibility to harmony, discord and effects of *chiaroscuro*, as for instance piano, forte, crescendo and diminuendo.

This being so, is it unreasonable in us to surmise that if one were sufficiently well versed in the basic principles of form we might construct a scale of forms on identical lines with color and sound? Think a moment; music was commonly known long before the notes were decided or dreamed

* Read at the convention of the National Association of Stove Manufacturers May 2 and 3.

of. Colors were grouped harmoniously long before they were classified in their positions, though after the summer shower the orderly sequence of color was proclaimed in the beautiful segment across the heavens; may it not be true that all the primary elements of form have been used over and over again in harmonious combinations by persons of artistic temperament, judging correctly by intuition, when a demonstration quite as decisive as that of the Euclidian problems, was potentially present?

Let us see what some of the probabilities are: Certainly the harmonic triad is not lacking for expression in form or outline; the straight, crooked and curved line, as exhibited in the square, the elastic curve and the circle, are in evidence. Again, if we look at form and sound in what might be termed their polite aspect, we find for the first white, gray and black composing together the monochrome, and in the second we have oratory, singing, and singing with instrumental or vocal accompaniment, or orchestration, while the structure of all musical sound bears out the theory of form in the tonic, the mediant and the dominant, all being used in quantity, arrangement and pitch to form a melody precisely as the gamut of the rainbow may be distributed and reunited in various combinations and sequences to form harmonies, contrasts or discords, form, color and sound being equally dependent for effectiveness upon an identical harmonic triad.

Now, if arrangements of sound in combination produce a distinct harmony or discord, and if combinations of color follow precisely similar lines, is it not reasonable that form may obey the same laws as color and sound? Again, if these harmonies and discords in sound and color are capable of being analyzed and classified so that from their positions in a diagram or staff a deaf man may construct a melodious and pleasing combination of tones, or one born blind can produce a harmonious color scheme, how much more reasonable that a knowledge of the Newtonian theory of color and sound will enable one skilled therein to design beautiful ornamental combinations, quite independent of any natural or acquired taste for decoration; and finally, if this person combines a scientific knowledge with a temperament susceptible to the effects of good or bad arrangements of elementary forms, such a one will of necessity compel recognition, as an expert designer, from all classes of people, especially from the educated and cultured, but with equal certainty from the rude and ignorant.

The Theory's Application.

We have not the time to go into an elementary explanation of how we place before our very eyes a chromatic scale of applied forms. It is enough that you have followed thus far and understand the possibilities of such an application. We have gone on together to an orderly and popular examination of the principles involved, and now we will discuss very briefly the application of all this to the decoration of your productions.

For, after all, and notwithstanding your patience and attention, what you most desire to hear is some suggestion which will show how to arrange the lines of proportion and ornamentation of your stoves as to produce, in a measure, the same effect upon the intuitive perceptions of the average prospective buyer that a scientific exposition would produce upon you or any other assembly of educated and cultured persons. Your goods ought to be so attractive that even the *persiflage* and hyperbole of a Fred. Gardner, or a Hope Boal, would be "love's labor lost."

In the development of a systematic scheme of ornamentation such as has been outlined, many disappointments and nonsequences occur and conclusions must be carefully made. The man who pays only superficial attention to matters of art is usually free with his opinions, often couched in the form of an *ipse dixit*, but when one devotes a lifetime to reading and study and practice, then caution and conservatism become factors in the equation. As hinted in the beginning, I am not so sure of my ground as to warrant a graphical demonstration of the gamut of form in its complete fulfillment, but of the results obtained there will be no hesitancy in placing examples before you and inviting intelligent criticism. In the first place, it is impossible to treat the formal decoration of stoves diatonically in the pattern as commonly constructed. The pattern must not be, in its original form, a wooden plate upon which is planted, almost at random, incongruous figures and shapes miscalled ornaments, but, on the contrary, the pattern proper and its decorative features should be an entity. It follows then that the completed model will be little more than a plastic sketch in clay or similar material. But there is another reason why this must be so—stoves are made of cast metal, which in process is a liquid. It is in waves and undulations while being poured, coming to rigidity very gradually, therefore, to be in unison, a similar substance must be used from which to fashion the model. Clay is not an ideal material by any means, but it is susceptible to manipulation and is the best thing known. It must first be treated for various weaknesses, particularly that of cracking when dry. In Exhibit M, five well-known methods are shown. 1, the clay model; 2, the wax model; 3, the carved wood; 4, the glue and white "compo"; and last, that friend-in-need of the man without an idea, a bit of Linerusta-Walton. The artistic superiority of the clay and wax models is in evidence.

Another mistake is to so design a piece of ornamental cast iron as to project details of any depth at right angles to the flow of the metal in casting; curves, gentle undulations and boldness, without distinct abruptness in the rise of the higher portions, is the desideratum.

As you would not overlay one opaque color upon another, nor in sound place in juxtaposition two or more discordant notes, so in ornamentation the different elements should be amalgamated, or at least joined permanently. For example, tiles should be cast into your plates if you desire to use them, not fastened in with a frame. I show my idea in Exhibit N.

Lettering ought to be sparingly used and never merged into the design proper. After many experiments it seems that a brass letter, cast into the plate, is the most practical; and it is really very handsome. (See Exhibit O.) Above all, avoid the so-called ornamental lettering put on in warts and patches. If you have anything to say in cast iron pipe, use an honest, straightforward alphabet.

Our principle applied to the use of mica is rather bewildering; for it must be cast in the door, not fastened with a mica frame as now. And yet why not? Mica doors are the lighest parts of a stove, the easiest dismounted and replaced, thanks to the tin hinge tube. If the mica wears out why not allow the user the privilege of buying a new door, mica and all, from the original maker? To see the beauty and practicability of this, notice Exhibit P.

There is literally no end of changes necessary in your practice if this diatonic scale of form is correct; but too much time has been taken already. In closing, permit me to thank you for your attention and to express my appreciation of your kindness in inviting me to discuss with you some of the many really important matters relating to the design of ornamental patterns.

Echoes of the Convention.

— The headquarters of *The Metal Worker* were in Room 646 in the Auditorium Hotel, immediately opposite the entrance to the convention hall. Attention was called to the headquarters by a number of copies of the paper festooned about the entrance. The members of the association quite generally dropped in to greet the representatives of the paper, and at times there was a large party assembled discussing various phases of the stove trade.

— Among those who thus graced the headquarters with their presence, one of the most brilliant conversationalists was B. W. Dodson of the Detroit Stove Works, whose sallies of wit were well received, even by those who formed the target for his good natured attacks.

— Another very welcome visitor was A. C. Mott of the Abram Cox Stove Company, whose discourse was of the substantial order, as befits one who represents the dignity and sterling worth of the Quaker City.

— N. B. Perry of the Perry Stove Company was a genial visitor, who generally permitted others to do the talking, but would occasionally interject a remark which squarely struck the heart of the subject.

— Francis Kernan of Utica told of some interesting experiences he had passed through in Chicago, which illustrated the humorous side of life, but as the subject is barred in these columns they cannot be repeated. Mr. Kernan bubbles over with humor, and evidently is more of an optimist than business men are generally, especially in these times.

— The delegation of manufacturers from the South shivered for part of the week while the breezes blew from Lake Michigan over the Garden City. It was quite an abrupt change from a temperature of 90° or thereabouts, which they had been enduring, to 50° or even lower. For a time overcoats were in pressing demand. In the convention hall, however, the warmth of some of the discussions partly atoned for the low temperature outside.

— It is said that the leading officers of the association will rejoice in the possession of new hats at the expense of one of their number. It is the result of a bet which was made on some subject connected with the Defense Association, but the details of which seem to be carefully guarded by those concerned. The bet was of a cumulative character. When it was first made, the bettor was so positive of his position that he immediately wagered another hat with the bettee that the latter would lose. This was accepted, and immediately an associate of the bettor wagered another hat with the bettee that he would lose both bets. Again the proposition was accepted, but as the bettee thought that three hats would be too many for him to occupy at one time, he announced that if the bet should be won by him the hats would be divided among the three principal officers aforesaid. And he won.

— The practical men among the stove manufacturers were very much interested in the operations of a machine shown by J. Winfield Pugh, representing the American Machinery Company of Detroit. It is a universal trimmer, and is particularly adapted to use in the pattern shop for squaring, mitering, making core wedges, cutting segments, cutting gear teeth, &c. The cutting is done with knives, truer than with a saw and smoother than if sandpapered afterward. The machine is operated by hand, the knives moving in guides and thrown forward and back by a lever. It is mounted on a column and can be swiveled in a complete circle to suit the operator's convenience or held at any point by means of a nut.

— The many friends of Frederic W. Gardner were pleased to see that he was again able to be out after having endured a long siege of illness. The primary cause of his trouble was a heavy cold which rapidly developed serious tendencies, requiring the most skillful treatment.

— Francis Kernan of Utica, N. Y., is now one of the veterans of the association, having taken part in the deliberations of the second convention and thenceforth attended every annual meeting. Mr. Kernan is one of the most genial of the many amiable members of the stove fraternity and has the happy faculty of ever looking on the bright side of things.

Taplin, Rice & Co.

We have received from Taplin, Rice & Co. of Akron, Ohio, a carefully arranged and neatly printed copy of the illustrated catalogue and price-list which they have just issued from the press. In the make up of the volume the body of each page is printed in bluish ink, while the ornamental border is in a light chocolate color. The design of the border embraces sprays of ferns, a *fac simile* of the company's trade-mark, and running down the edge, at the left hand, their name and address. The company have been engaged in the manufacture of stoves over 26 years, and during that period have used every effort to establish and maintain a high standard of excellence in the character of their goods. The future policy of the company, it is stated, "will be marked by an energy

that will command the confidence of the trade and merit the continuance of the liberal patronage" which they have thus far enjoyed, and for which they make grateful acknowledgments. The goods shown are offered under the generic name Climax, and consist of an interesting assortment covering ranges and cook stoves for burning coal and wood, and also those for burning wood exclusively. The heaters occupy the closing pages, the leading position being given to the Solar Climax, which is the company's latest addition to their line. In it is embodied many of the features which have rendered some of their other goods so popular with the trade, while portions, especially above the fire pot, are entirely new. The ornamentation is neat, nickel work being judiciously combined with the black surfaces. A line of hot air furnaces completes the catalogue, which is bound in stiff board covers, with attractive side title.

ODD PLATES.

Numerous changes have taken place in the domiciles of the Chicago stove houses. Lake street has lost some of the establishments which had been so long on that street that they were landmarks. Cribben, Sexton & Co. have removed their salesroom to the foundry, which is on Erie street, on the north side of the city, and S. S. Jewett & Co. have consolidated their sales department with the warehouse on the south side. The Brand Stove Company have closed up their Chicago sample room. The west side colony of stove houses has also suffered from further withdrawals. The Detroit Stove Works have removed to their new warehouse on Twenty-ninth street, and two or three houses are entertaining propositions to remove to other locations. The stove interests of Chicago are now widely scattered, being found all over the city. In few cases are there more than half a dozen concerns within easy walking distance of one another. Receiving and shipping facilities now seem to have paramount consideration among the stovemen, little thought being given to the convenience of buyers visiting the city, because such visits are steadily becoming further apart.

"The Home Comfort Cook Book" is the name of an interesting publication which reaches us from the Wrought Iron Range Company of St. Louis, Mo. It bears date of May, 1894, and consists of 164 pages of letterpress, illustrated with numerous engravings and bound in colored paper covers, the front of which represents the interior of a kitchen fitted with a Home Comfort wrought steel range. On the smoke pipe, just above the stove top, is a plate indicating the number of Home Comfort ranges sold up to January of the present year. This number is given as 277,188. The ranges are made of malleable iron and cold rolled wrought steel, and are provided with either four or six boiler holes. The oven door drops to a horizontal position, and is said to be so braced that a heavy jar or pressure cannot break or injure it. The front and rear of the oven are fastened to the body of the range by heavy malleable frames, while the top frame is fastened to the body by heavy lugs. These ranges are adapted for use in hotels, restaurants, public and private institutions, steamboats, dining cars, &c. Among the opening pages we find extracts from newspapers relating to the company and their goods, a general view of the company's office, salesroom and factory in Toronto, Ontario, a short history of the business of the concern, together with mention of the materials employed in the construction of the Home Comfort goods. As indicated by the title of the work the greater number of the pages are devoted to recipes which the housewife is likely to find useful. There are also given a large number of testimonials, as well as lists of names and addresses of some of those who are using the company's ranges. The latter portion of the catalogue is devoted to an illustrated description of the Home Comfort steel range, following which, attention is given to a miscellaneous assortment of kitchen utensils, hot air furnaces, hotel cooks' and butchers' cutlery and an alphabetical index. The fourth page of the work is embellished with a general view of the office, salesrooms and factory of the Wrought Iron Range Company, which cover an entire block.

The Culter & Proctor Stove Company of Peoria, Ill., started their foundry April 30 after a suspension of several weeks. They put on a full force of workmen and will now run steadily. They report excellent prospects, having a good demand for their line of stoves and ranges. In fact, the foundry has been started somewhat earlier than the company had anticipated when they shut down.

Smith & Bright, agents for the sale of Graff & Co.'s Faultless and Hero furnaces, have removed to 175 and 177 Lake street, Chicago, where they have secured enlarged facilities for accommodating their increasing trade. The new location is nearer Fifth avenue, an important north and south artery of commerce and street car transportation. In their new location they will carry a much larger stock of hot air furnaces and hot water heaters. They have just closed a contract for heating a school building at Sheboygan with a combination of hot air and hot water.

The Brilliant Steel Range & Gas Machine Works of 9–19 Church place, Cincinnati, Ohio, send us a folder of liberal proportions illustrating the Brilliant steel ranges which they manufacture. These stoves are made for burning hard or soft coal, gas or wood, and are offered in a variety of styles and sizes. They are fitted with reversible and dumping anti-clinker grates, with automatic balance lock, asbestos lined flues, oven doors fastened with automatic gravity latch with gravity catch, revertible drop chute feed door doubled, lined and ventilated, oven plates thoroughly braced and all joints closely hand riveted. All ranges are made with or without broiler, top closet or tank attachment. The hot water heater extends the full length of the fire chamber and the heating capacity is referred to as being exceptional. The company call attention to their Brilliant gas machine, Brilliant gas cook stoves and Brilliant gas heaters. The company include E. Schmidlin, J. N. Rabenstein and C. V. Fleetwood.

A press dispatch under recent date from Warren, Ohio, is to the effect that the Etna Foundry & Machine Company of that city have decided to discontinue the manufacture of machinery and to so alter the plant as to turn out steel ranges and hot air furnaces.

Sam S. Utter has the sympathy of a wide circle of friends, both in and out of the stove trade, in the death of his wife, which occurred on May 9, at the St. George Hotel, Brooklyn. The funeral services were held Thursday evening, at 8 o'clock, at the residence of John L. Utter, 365A Quincy street. The attendance was large and included many representatives of the stove trade.

The Fuller & Warren Company are distributing a couple of leaflets illustrating the Stewart range, made with large square oven and their No. 142 double oven range, made in portable form and also adapted for brick setting. These are both new constructions, the Stewart having a large draw out hearth, wrought iron ash pan, patent oval fire box and interchanging triangular Dock-ash or draw center grates, which may be removed without disturbing the water front or linings. The double oven range has sheet flues, direct draft damper and a water back which can be removed without displacing a bolt, new pattern handles on all doors, patent oval fire box and triangular revolving grate. The doors of the oven, broiler, firebox and damper are arranged to drop.

Charles Whiting, who represents the interests of Eugene Munsell & Co. of 218 Water street, New York, has just returned from a business trip, having secured a number of good orders for gasoline stoves.

The Bennett & Peck Heating and Ventilating Company of Cincinnati are represented in Chicago by W. H. Martin at 82 West Washington street. Mr. Martin has had a long experience in the heating and ventilating line, and takes special pleasure in handling difficult problems in satisfactorily heating large buildings for public gatherings.

The friends of the Chicago & Erie Stove Company of Erie, Pa., are offering their congratulations on the successful introduction of the company's goods in the United States Navy. The Government has recently purchased two steel ranges, hotel size, for use aboard the man of war "Michigan." This purchase is all the more gratifying when it is remembered that the Government officials inspected a number of steel ranges, and finally selected the company's Superb Helper for trial, after which it was subjected to the test of several months' service before the purchase was completed. The "Michigan" is intended for cruising on the Great Lakes.

The New Era steel range, made by the H. Franke Steel Range Company of Cleveland, Ohio, was used at the recent exhibition of bread baking at the store of A. S. Phinney. Six tests were made, and according to the Erie *Evening Herald*, "bread was baked in just 15 minutes by the watch, the fuel being natural gas."

The Meyer Furnace Company of Peoria, Ill., were recently incorporated, with a capital stock of $50,000. The list of incorporators includes the names of Frank Meyer, D. Meyer, George F. Meyer and George Harms.

The Security Gas & Vapor Stove Company, St. Louis, are directing the attention of the trade to their Security gas range, with barbecue steak broiler, copper water heater and lighting torch. The goods are substantially made, and are being placed on the market for both summer and winter use.

The Girard Stove & Foundry Company of Girard, Ohio, have decided to erect a new foundry building and give employment to an increased number of men. Various places for the erection of a plant are being considered, each of which, we understand, will offer some inducement. At the date of latest advices no decision had been reached as to location, but it is expected the matter will be settled before this issue reaches our readers.

TRADE REPORT.

The Iron Market.

The situation is very much mixed, the growing scarcity of Coal and Coke interfering very considerably with operations. Production of Pig Iron was 16,522 tons less weekly on May 1 than it was on April 1; and since then we have advices that 17 other furnaces, representing a tonnage weekly of 21,192 tons, have stopped. Further additions to the list are known to be sure during the next week. The resulting scarcity of Bessemer Pig has driven the market upward to $12, Pittsburgh, transactions having been closed for upward of 30,000 tons, including one block of 13,000 sold by a Cleveland interest to a Pittsburgh concern. Even then the demand has not been filled.

If the strike should continue and establish a permanently higher range of values, which many are confident of, then the pressure of Pittsburgh, Wheeling and the Valleys in Eastern and Western markets will be much relaxed. The advance in freight rates from the Pittsburgh district east and west will aid in the same direction.

So far as the rolling mills are concerned they are able to worry along much better than the furnaces. Natural gas in some sections and oil in others is enabling them to make pretty good time thus far. The result is that in spite of the rise in raw material Finished Iron and Steel has moved but little. The feeling is a little firmer, but no real advance except for immediate requirements has been established. It seems reasonable to expect some improvement to correspond with the higher coat.

It is an astonishing fact, but it remains a fact, that there are signs of weakness in some sections in the market for Foundry Irons.

Pig Iron.—There is only a moderate run of inquiries and current business is light in the New York market. Some of the furnace agents have had instructions to withdraw from the market, but in spite of that competition continues keen and prices have not been favorably affected as yet. We quote standard brands $12.50 @ $13.25 for No. 1; $11.25 @ $12 for No. 2, at tidewater. Southern Iron, same delivery, $11.50 @ $12.25 for No. 1; $10.50 @ $11 for No. 2; $10 @ $10.25 for No. 3; $10.25 @ $10.75 for No. 2 Soft, and $10.50 @ $11 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is $9 75 @ $10.25.

The Philadelphia Pig Iron market is not in a satisfactory condition, although the volume of business is maintained, and the supply not excessive, although ample for all demands. Prices are very irregular and on the whole a shade lower than they were a week ago, but it is almost an impossibility to give exact quotations. The entire demand seems to be for No. 2 X, or No. 2 Plain, the former being quoted all the way from $11.25 to $12, with the bulk of the business at $11.35 @ $11.50, but all depends on what the Iron may be, how much is taken, and at what point it has to be delivered. Plain No. 2 and lower grades are nominally $10.50 @ $10.75, but the right kind of a buyer can come pretty close to $10.25, although the supply of that grade is not excessive. General quotations for Philadelphia and equivalent points are about as follows :

Standard No. 1 Foundry X	$12.50 @ $12.75
Standard No. 2 Foundry X	11.25 @ 11.75
No. 2 Plain	10.75 @ 11.00
No. 1 Soft	11.50 @ 11.75
No. 2 Soft	10.75 @ 11.00

A little improvement is noted in the sales of local Coke Iron in the Chicago market and the inquiry has notably increased. Consumers are not disposed to purchase larger lots than heretofore. But they are inclined to purchase oftener. Sales of Southern Iron are confined to small lots in the same way, but an occasional buyer is making inquiries on round lots. At least one conspicuous Southern brand is now out of the market on account of the scarcity of furnace fuel in the South, and others are expected to be withdrawn very shortly if the strike does not speedily come to an end. The foundrymen in the Chicago district are beginning to run short of Coke, and some of them have already reduced their output of castings. This will restrict the demand for Pig Iron if it assumes any large proportions. The Foundry Coke dealers hope to be able to secure enough Coke from districts unaffected by the strike to keep the foundry trade supplied. The demand for Lake Superior Charcoal is light. One of the leading producers of this class of Iron reports that April was the month of smallest trade he had for several years. The demand is very rarely for larger than carload lots and prices are well maintained on such quantities. Quotations are given as follows for cash :

Lake Superior Charcoal	$15.00 @ $15.50
Local Coke Foundry, No. 1	11.25 @ 11.50
Local Coke Foundry, No. 2	10.50 @ 11.00
Local Coke Foundry, No. 3	10.00 @ 10.50
Local Scotch	11.50 @ 11.75
Ohio Strong Softeners No. 1	12.60 @ 13.50
Southern Silvery, No. 1	@ 11.50
Southern Silvery, No. 2	@ 11.00
Southern Coke, No. 2	10.00 @ 10.35
Southern Coke, No. 3	9.75 @ 10.00
Southern, No. 1, Soft	10.25 @ 10.50
Southern, No. 2, Soft	9.75 @ 10.00
Tennessee Charcoal, No. 1	15.00 @ 15.50
Tennessee Charcoal, No. 2	14.50 @ 15.00
Alabama Car Wheel	17.85 @ 18.00
Jackson County Silvery	15.00 @ 16.00
Other Ohio Silvery	12.50 @ 13.00

In the Pittsburgh district the Coke strike is playing havoc with the furnaces, more than half the number being closed. The Cleveland district is also idle. It is the impression that even with a settlement of the Coke strike prices of Bessemer Pig will not materially decline, as many of the furnaces are sold ahead for two or three months, and the available supply is bound to be limited for some time. Owing to the light demand for Foundry Iron, prices have shown very little improvement. For spot deliveries of Pig Iron we quote as follows:

No. 1 Foundry	$11.00 @ $11.25, cash.
No. 2 Foundry	10.25 @ 10.50 "
No. 3 Foundry	9.75 @ 10.00 "
Bessemer	12.00 @ 12.50 "

According to our Cincinnati advices trade in Pig Iron at that center continues to be greatly restricted. Many of the furnaces are accepting no orders for forward delivery, but there is no great demand, so that prices are not much better than nominal. There has been a fair business in a small way for current consumption in this district and in the East, the orders being from one to three carloads, mainly for Coke Foundry, but with a fair sprinkle of Charcoal Iron ; and although the orders are individually small, they make a considerable aggregate. Quotations are unchanged, but are scarcely more than nominal, as follows:

Southern Coke, No. 1	$10.25 @ $10.50
Southern Coke, No. 2	9.25 @ 9.50
Southern Coke, No. 3	8.75 @ 9.00
Ohio Soft Stone Coal, No. 1	14.50 @ 15.50
Ohio Soft Stone Coal, No. 2	14.00 @ 14.50
Lake Superior Coke, No. 1	12.50 @ 13.00
Lake Superior Coke, No. 2	11.50 @ 12.00
Hanging Rock Charcoal, No. 1	17.00 @ 17.50
Hanging Rock Charcoal, No. 2	16.50 @ 17.00
Tennessee Charcoal, No. 1	13.00 @ 13.50
Tennessee Charcoal, No. 2	12.00 @ 12.50
Standard Southern Car Wheel	16.25 @ 17.00
Lake Superior Car Wheel and Malleable	16.25 @ 16 75

The situation in the St. Louis market is not materially changed. The strike in the Southern district has had the effect of making prices a trifle firmer. The scarcity of Coal is also having a beneficial effect, and it is pretty generally agreed that should the Coal strike continue through the month of May at least 50¢ ℔ ton will be added to the selling price of Iron. Sales during the week have been fairly good. We quote as follows for cash, f.o.b. cars St. Louis:

Southern Coke, No. 1 Foundry	$10.75 @ $11.00
Southern Coke, No. 2 Foundry	9.75 @ 10.00
Southern Coke, No. 3 Foundry	9.50 @ 9.75
Southern Car Wheel	16.75 @ 17.75
Lake Superior Car Wheel	16.25 @ 16.50
Ohio Softeners	14.25 @ 14.50

Metal Market.

Pig Tin.—Regular trade purchases have been routine in character and merely fair all told. Speculative movement has been moderate also Still prices have climbed quite as much as London fluctuations warranted, finally getting up to about 20.10¢ net cash for 5-ton or larger lots, prompt or near future delivery, with distant futures at some premium. The idea exists that pure manipulation has been largely instrumental in helping prices upward and that London operators are the chief manipulators. This idea is not without reason, since London fluctuations have apparently governed local prices in a great degree irrespective of the statistical position on this side of the Atlantic, while local representatives of leading London operators have been the stiffest bidders on both nearby and distant future deliveries. In actual sale prices have been carried to 20.10¢ @ 20.15¢ net cash for 5-ton or larger lots, while up to 20¼¢ regular terms were paid for ordinary jobbing parcels. Small lots from store are quoted at 21¢ @ 21¼¢ ℔ lb. The supply in first hands here, it is estimated, does not exceed 700 tons, or the equivalent of about three weeks' consumption.

Copper.—The situation is wholly unchanged. Home consumers are slow buyers and exporters more carefully in view of the weakish condition of the European market. The foreign markets, it is claimed, are not paying over the basis of 9¼¢ for Lake Superior Ingot, relatively more for other varieties and special rates to large home consumers are said to be the rule rather than the exception. This on speculative offers to sell at 9.40¢ gives the market a weak appearance, although 9.50¢ stands as the popular quotation Electrolytic is freely offered at 9.25¢, and it is understood that bids of 9.12½¢ have been solicited in numerous instances. Casting stock remains at about 9¢ @ 9.12½¢.

Sheet Copper.—The market for Manufactured Copper continues tame. Orders and inquiries come in very slowly, consumers displaying an unusual lack of interest. Prices are inclined to softness.

Pig Lead.—Merely routine business has been done here, and the demand has shown no spirit whatever. In fact, the only display of life was on the part of a few speculators who ventured to offer to sell at as low as 3⅝¢ for June and July delivery. They sold very little, if anything. although brokers obtained 3.40¢, 3.42½¢ and 3.45¢ for carload lots of desilverized from consumers. The indications are that a "bear" interest has been striving to force values lower by tricks with which they are familiar, and that speculative circles have been used to best advantage in that connection. The consumptive demand has been comparatively feeble both for Pig and manufactured Lead. Jobbers' price for small lots of the former remains at from 3½ to 4¢ per lb.

Spelter.—Very little business has been done here and the Eastern demand has continued extremely tame. All signs of speculative interest have vanished, and the best efforts with consumers have been slimly rewarded, purchasers being satisfied to provide only for their immediate wants. Hence a flat sort of market, with prices still rather soft at about 3 50¢ @ 3.55¢ for common Western, delivered here or at common point, with an advance of about ¼¢ on small quantities. Stocks are, however, lower than ever, and any large orders would suffice to send prices upward.

Antimony.—Sales have been made at 8¾¢ @ 8⅞¢ for Hallett's, 10⅛¢ @ 10¼¢ for Cookson's, and corresponding prices for other grades. The jobbing demand has been very fair, and prices for small quantities steady, at an advance of about ¼¢ on those above named.

Nickel. — Prices are considerably apart, varying according to size of order, &c. There is merely routine business. The range of 45¢ @ 50¢ is quoted.

Tin Plates.—It cannot be said that the market displays any change in the direction of improvement. Consumers have been taking spot goods in a very limited way only. Purchases from store fall considerably below the average for the season, and individual orders are generally of the small hand-to-mouth character with which dealers have become so familiar of late. Even those customers who in ordinary times are the most liberal buyers appear unwilling at the present time to take a box beyond what they actually need to fill their passing requirements, notwithstanding the low prices now ruling. Future deliveries also are in limited demand, and are confined to a very few weeks ahead, in view of possible tariff changes in the near future. Import shipments continue light and stocks in importers' hands are becoming attenuated. Scarcity is noted in some lines of imported Plates, yet prices remain rather weak, though showing no quotable change. In regard to the Tin Plate market in the West, our Chicago representative reports as follows: Roofing Plates are very scarce. Every American mill appears to be loaded up with business, and brands are being withdrawn from the market, as the manufacturers are not in shape to take additional orders for early delivery. Under the circumstances prices might be expected to advance, but for some reason the scarcity has so far failed to enhance values.

A special cable dispatch to *The Iron Age*, dated London, May 9, describes the British Tin Plate market as follows:

In Tin Plate business has been limited, but there is some sign that buyers are more inclined to make contracts. Canadian buying of Charcoals and Ternes is particularly favorable. Stocks at Swansea are now about 276,000 boxes. Output of works has greatly receded owing to dispute with operatives, but is still fair and exceeds shipments. Liverpool quotations are as follows:

IC Charcoal, Alloway grade	12/ @ 12/6
IC Bessemer Steel, Coke finish.	11/3 @ 11/6
IC Siemens " " "	11/6 @ 11/9
IC Coke, B. V. grade, 14 x 20	Nominal.
Charcoal Terne, Dean grade	10/3 @ 10/6

Sheet Iron.—Galvanized Iron shows a firmer feeling, and some mills are said to have withdrawn their quotations. Yet jobbers maintain that the demand for this material is still on an exceedingly narrow scale and that at present prices it scarcely pays them to handle it at all. Black Sheets, except those of light gauge for tinning, are moving slowly, consumers having apparently placed their orders with the mills for all that they will require this side of July. Prices are unchanged at their former low level.

Chicago Report.

Scrap.—Business contiuues very light. Dealers furnish the following list of buying prices, Chicago delivery:

	Per net ton.	Per lb
No. 1 Wrought Scrap	$7.00	....
Machinery Cast	6.00	....
Malleable Cast	5.00	....
Stove Plate (free of burnt)	4.00	....
Burnt Iron and Grate Bars	3.00	....
Sheet Iron and Hoops	2.00	....
Plow Steel and Breaking Stock	4.00	....
No. 2, such as Shovels, Hoes, &c	3.00	....
Old Boilers—whole (Iron)	3.00	....
" (Iron)—cut in single Sheets and Rings	5.00	....
Old Gas-Pipe and Boiler Tubes	5.00	....
Cast Borings	3.00	....
Turnings	4.00	....
Horseshoes	8.00	....
Copper Bottoms	....	5½¢
Copper Clips and Heavy	....	7 ¢
Heavy Brass	....	5½¢
Light Brass	....	3 ¢
Pipe Lead	....	2¼¢
Tea Lead	....	2 ¢
Zinc	....	2 ?
Rubber	....	3½¢

Anthracite.—Dealers report very little trade moving. The famine in soft Coal has not yet been severe enough to cause consumers to turn to hard Coal. Carload lots of 12 net tons or over are quoted as follows:

	Egg, Sto. Grate.	and Ch.
Chicago, Ill	$5.00	$5.25
Milwaukee, Wis	5.00	5.25
Kansas City, Mo	8.20	8.45
Council Bluffs, Iowa	8.20	8.45
Lincoln, Neb	8.35	8.60
Sioux City, Iowa	8.20	8.45
Aberdeen, S. Dak	8.25	8.50
Dubuque, Iowa	6.30	6.55
Madison, Wis	6.50	6.75
St. Paul, Minn	7.50	7.75
Burlington, Iowa	6.50	6 75
Des Moines, Iowa	7.95	8.20
Davenport, Iowa	6.30	6.55
St. Joseph, Mo	8.20	8.45
Leavenworth, Kan	8.20	8.45
Omaha, Neb	8.20	8.45

Pueblo	8.00
Colorado Springs	8.00
Leadville	8.00
Cheyenne, Wyo	10.00
All points between Denver and Missouri River	8.85

THE JOHN SIMMONS COMPANY, 106–110 Centre street, New York, dealers in Pipe and Pipe Fittings and Supplies, are issuing a circular on Ash Cans, giving their experience with those of ordinary manufacture and by means of a half tone engraving show them after two months' use. They state that their experience has been unsatisfactory and that they have got up an Ash Can for their own use which they are now offering to the trade.

THE TRADE will be interested in the announcement on another page of Smith & Winchester, Boston, Mass., which calls attention to the Boiler they are just putting on the market, which is to be known as the Winchester. They invite the trade to arrange for agencies for this new apparatus.

E. W. BLISS COMPANY, Brooklyn, N. Y., issue notice to the trade that they have lately removed their Chicago office and works from their former location at 414 Canal street to more commodious quarters at 100, 102 and 104 West Washington street, where they will continue a representative line of their Presses, Drop Hammers, Shears and Sheet Metal Machinery. The Chicago office is still in charge of C. W. Ellsworth, late superintendent of the Chicago Stamping Company, whose large experience with tools of this class from the user's standpoint will, it is pointed out, be of value to customers in the selection of machines and methods.

TWO ROLLING MILL PROJECTS are interesting the citizens of Anderson, Ind. One of these is a sheet mill to manufacture Merchant Sheets and Black Plates for tinning, and the other is a rod and wire mill, probably in connection with the wire nail works of the Hszen Company.

KIECKHEFER BROS & Co., Milwaukee, Wis., will soon enter upon the manufacture of Enameled Ware, and with this end in view have commenced the erection of a $150,000 addition to their already extensive plant. They will manufacture Enameled Ware in all colors and styles. The new department will give employment, it is expected, to some 200 skilled workmen.

MILLER, SLOSS & SCOTT is the name of the hardware firm who have succeeded the late Huntington-Hopkins Company of San Francisco.

ON THE NIGHT OF MAY 3 the works of the Cincinnati Tin & Japan Company, Sycamore and Canal streets, Cincinnati, Ohio, were completely gutted by fire. The total loss is estimated at about $70,000, covered by insurance. The outside walls of the building, however, were not injured by the fire and the company will rebuild immediately.

CONDITION OF THE

Hardware Trade.

THE FINE WEATHER and the natural movement of trade have induced something of an increase in the volume of business from the retail trade, and many carefully assorted orders for small quantities are being received. Stocks are kept light, and buyers are avoiding purchases at all in excess of their early needs. The tone of the market causes a close adherence to this policy, it being recognized that prices on many goods are weak as well as low. There is accordingly little confidence in the stability of present quotations, even on such goods as have receded so far as to leave little probability of their further decline. Reports from the trade indicate that on the whole a healthful financial condition prevails. Although there is some complaint in regard to collections, there are few houses who are regarded as being in financial difficulties. Quotable changes in price are few, but there is a disposition on the part of both the producers and distributors of goods to make concessions when necessary, and on many goods there has been a perceptible settling in price during the past few months. There is thus an opportunity for buyers to exercise judicious care and skill in the placing of their orders.

Advices from Chicago.—Quite an improvement is noted in general business by the Shelf Hardware jobbers. The good weather of the past week has been favorable for outdoor work, and improvements are generally being made by farmers at this time of the year. Their demand is putting the country merchants in good condition to continually add to their stocks. The crop prospects are very flattering throughout the entire Northwest, and reports received from all quarters are now very encouraging to merchants in all the jobbing centers of this section. They are advising their correspondents to have no hesitation to lay in stocks of such goods as are in ready demand, having no apprehension that prices will be lower than are now current. Some lines of staple goods are very firm and show a tendency to advance. The coal strike is, of course, the most important element in this direction, but there are other influences at work which are expected to keep prices firm, if not to advance them. The jobbers in Tinware and House Furnishing Goods are not in quite so good condition as their Shelf Hardware brethren, and so far have experienced very little improvement in their branch of trade. The Heavy Hardware jobbers likewise report business quiet in their line, owing to the light demand from manufacturing establishments whom they supply with goods.

Notes on Prices.

Wire Nails.—The market is in substantially the same condition as last week, with perhaps a slightly firmer tone, on account of the uncertainty as to the effect of the strikes. As a result, manufacturers are not soliciting business so eagerly, and are not offering inducements so freely as a week or two ago. The volume of business continues good, though not specially heavy. It is made up for the most part of relatively small lots, but it is understood that some large buyers are in the market. Quotations for carload lots at mill are 95 cents up to $1, the former figure being usually obtainable. Small lots from store in New York are quoted at $1.15 to $1.25.

Advices from Chicago.—A good demand is reported for Wire Nails from points further west, and in some cases orders are coming in by wire. The city trade is less active than that originating in the country. Sales have been made by manufacturers at a slight advance over recent prices. Several factories are now known to have been stopped on account of the coal famine and others are expected to drop out during the present week. One of the largest concerns in this vicinity has therefore advanced its prices 5 cents per keg on Nails to be shipped from warehouse on account of the stoppage of the factory. Mill shipments are now firm at about $1.05 to $1.10, Chicago, with an advancing tendency. Jobbers quote small lots from stock at $1.10 to $1.15, but talk of advancing their prices at an early day, owing to the pressure from the mills.

Cut Nails.—The Cut Nail market also feels to some extent the influence of the labor troubles and the uncertainty as to their duration and effect. Prices are only slightly affected, the market being given a somewhat firmer tone in view of the fact that manufacturers are not disposed to make concessions as freely as heretofore. The Western price is about 90 cents for carload lots at mill. The price of Nails delivered in New York is 95 cents to $1 base, small lots from store being held at $1.10 to $1.15.

Advices from Chicago.—Manufacturers report a fair business during the week, with moderate sales to merchants in all sections of this immediate territory. While trade in this line has not been heavy it is as large as usual at this season. Prices are continued at 95 cents, Chicago delivery, on factory lots of 55-cent average. Jobbers quote small lots from stock at $1.05 to $1.10.

Barb Wire.—The demand for Barb Wire continues remarkably good for the season, and the volume of business is fair. The tendency toward irregularities in price has been checked somewhat by the uncertainty as to the outcome and effect of the strikes, and quotations continue with a slightly better tone about as last week. They are as follows for Four-Point Galvanized: Pittsburgh, $2.05 to $2.15; Cleveland, $2.10 to $2.20; Cincinnati or Allentown, $2.15 to $2.25; Chicago or New York, $2.20 to $2.30.

Advices from Chicago.—Manufacturers have experienced a falling off in the demand recently, but the stoppage of some works on account of the Coal strike has apparently counterbalanced the restriction in trade and prices continue firm. Some manufacturers are advising their correspondents that an advance can be expected at an early day if the Coal strike does not soon terminate. Jobbers report a fair demand from stock. Quotations may be continued at $2.15, Chicago, for factory lots of Galvanized Barb Wire and $2.25 to $2.35 for small lots from stock.

Philadelphia Ice Chisel.—This article is manufactured by John Stortz & Son, 210 Vine street, Philadelphia, by whom it is sold to the trade at $2 per dozen net.

Nut Lock and Washer.—Horton, Gilmore, McWilliams & Co., 172 to 176 Lake street, Chicago, quote the following list on the Porter patent Combination Nut Lock and Washer, with a discount of 35 per cent. to the trade:

Size.		
3/12, 250 round, per pack.....	$5.00	per 1000
3/16, " regular, " "	5.00	" "
1/4, " " " "	5.00	" "
5/16, " " " "	6.67	" "
3/8, " " " "	6.67	" "
7/16, " " " "	6.67	" "
1/2, " " " "	8.35	" "
5/8, " " " "	8.35	" "

This Nut Lock is put up in a handsome antique oak counter case containing 21 pockets, holding about 4000 of seven sizes, assorted, and having extra pockets for ordinary washers as well.

Glass.—Manufacturers are still in an unsettled state of mind regarding the future of the Glass market, which uncertainty will not be relieved until the tariff question is settled; and under present conditions there is no incentive to store the product of factories. Demand appears to be equal to the present output of Glass, or so nearly so that stocks are not accumulating to any great extent in manufacturers' hands. It is too early to predict what effect the changes of rates in the Glass schedule of the tariff bill, as reported to the Senate May 7, will have upon the future Glass market if it passes in its present form. Pittsburgh factory quotations are reported as being 85 per cent. discount for single and 85 and 5 per cent. discount for double strength Glass. Present conditions indicate a favorable outlook for the Plate Glass trade in the near future, in anticipation of which additional factories are reported as preparing to start up. Quotations remain 70 and 10 per cent. discount for New York.

Old Metals.—The market for Old Metals is irregular, but prices remain at about their former level. Scrap Iron meets with somewhat slow sale in this vicinity. Dealers' purchasing price for Old Material is about as follows, delivered in New York:

Heavy Copper	℔	lb	7½¢
Light and Tinned Copper	℔	lb	6½¢
Heavy Brass	℔	lb	5½¢
Light Brass	℔	lb	4½¢
Lead	℔	lb	3¢
Tea Lead	℔	lb	2¢

Mixed Rope	℔	lb	¾ @	⅞¢

Old Rubber.—The market for this material is fairly active. Prices rule

about as follows, but are subject to change, according to conditions of sale and purchase:

Car Springs, ton lots, ℔ lb.	@	$0.03½
Rubber Shoes, carloads, delivered at factory, ℔ lb..	@	.03¼
Rubber shoes, less than carloads, ℔ lb.....	@	.03¼
Large Hose, ℔ ton.....	@	12.00
White Wringer Rolls, ℔ lb.	@	.03¾
White Syringes, ℔ lb	@	.03¾

Trade Notes.

THE EXCELSIOR STEEL FURNACE COMPANY, 38 West Monroe street, Chicago, advertise in this issue their machine made, double seamed, hot air Furnace Pipe, which they describe to be smooth as a bore, no solder, no buckling, air tight and dust proof. A coupon which appears as part of the advertisement will be accepted as the equivalent of $1 in payment for a first order of goods amounting to $10 or more.

THE JERSEY CITY GALVANIZING COMPANY, 28 Platt street, New York, will about May 16 move their office to 112 John street, New York.

CHARLES FAWCET of Sackville, N. B., is desirous of communicating with manufacturers of Cupolas, Tumbling Barrels, Polishing Mills, Emery Grinders, Lathes, Hoisting Gears, Circular Band and Jig Saws, Drills, Pulleys, Shafting, Hangers, &c., required in the complete equipment of a plant for Stove Plate work. He also desires to hear from firms supplying Nickel Plating outfits.

THE BOSTON WOVEN HOSE & RUBBER COMPANY, Cambridgeport, Mass., are distributing a little pamphlet illustrating their specialties. These include Cotton and Rubber Garden Hose, Rubber Belting and Packing, all of which are illustrated and described in a way to prove of interest and value to the trade. The company have offices in Boston, Chicago, St. Louis, Denver and San Francisco.

THE S. E. BARRETT MFG. COMPANY, manufacturers of Black Diamond Prepared Roofing, Roofing and Paving Pitch and coal tar products, 68 to 74 La Salle street, Chicago, have removed to rooms 909 to 914 Stock Exchange Building, corner of Washington and La Salle streets.

THE STARK MACHINE & TOOL COMPANY of Buffalo, N. Y., are favoring the trade with a catalogue of Tinners' Machines and Tools, Presses, Dies and Machinery for working sheet metal. It is a volume of something like 90 pages, profusely illustrated and bound in colored paper covers. The company refer to it as the tinners' edition of their illustrated Catalogue A No. 2, which, however, does not include all the articles which they produce. Ample descriptive letterpress is provided in connection with the numerous illustrations, so that those in want of goods of this character can readily learn of the merits claimed for them. Prices are also given, as well as an index arranged alphabetically. The company state that in addition to the Machines and Tools shown in this catalogue they manufacture a full line of foot, draw, power and double crank Presses, foot and power Crimpers and Squeezers, Double Seamers, Bending Machines and Dies of every description.

THE GEUDER & PAESCHKE MFG. COMPANY of Milwaukee, Wis., offer in their advertisement to supply dealers who purchase a quantity of the Cream City Flour Bin and Sifter with copies of a handsome booklet on the subject for distribution among their customers. We have received from the company a small pamphlet entitled "A Few Testimonials," in which are collected specimens of letters received from those who have used the Bins.

JAMES W. ROSS, room 647 The Rookery, Chicago, shows superb samples of the galvanized sheets now being made by the Whitaker Iron Company of Wheeling, W. Va. The crystallized surface is remarkably handsome, the coating is perfectly smooth and it adheres tenaciously to the body of the sheet, which is of very soft but tough steel.

SCRAP.

NORTON BROTHERS of Chicago are negotiating for the purchase of a part of the output of the Ellwood Tin Plate Company, Ellwood City, Pa. The plant of this concern was recently put in operation and will manufacture black sheets for tinning purposes. The concern have a four-mill plant and will give employment to about 100 men when in full operation.

WE LEARN from Nathan A. Taylor of the firm of N. & G. Taylor Company, Philadelphia, who was in this city last week, that their works are very busy at the present time, and their 19 pots are at present all in operation. A majority of the pots are making terne plates, but some six of them are operating on bright plates. Messrs. Taylor & Co. enjoy an excellent demand for their goods, and make it a point to keep on hand a full assortment of all sizes to meet the wants of their customers.

THE NEW ROLLING MILL of the Baltimore Iron, Steel & Tin Plate Company, at Baltimore, Md., is now in operation, giving employment to 70 additional hands and increasing the weekly output from 1200 to 1800 boxes. It is said to be the purpose of the company to build three additional mills at once, each of which will have a capacity of 600 boxes a week. They will be equipped with the most approved appliances and will cost about $40,000.

EXPORTS OF TIN AND TERNE PLATES from Great Britain in the month of April were 24,000 tons, against 39,000 tons in April, 1893. Of these amounts shipments to the United States were 13,000 tons and 31,000 tons respectively.

OPERATIONS AT THE new tin plate works of Meurer Bros. Company, Flushing avenue, Brooklyn, are proceeding with abundant success. Six pots are now installed and in regular work, turning out an average of 1700 boxes of tin and terne plates weekly. Three more pots are to be added within a short time. Messrs. Meurer have succeeded in producing coke tins and roofing plates of a quality that compares exceedingly favorably with imported material of a similar grade, and their product has been so favorably received by the trade that their orders exceed the present capacity of production. As yet the works have only been running during the day, but a night shift will shortly be put on, thereby doubling the present output. An electric light plant is being installed for this purpose. Four of the tinning machines now in use are of the Thomas & White pattern, two of them being employed on bright and two on terne plates. The other two machines are of the Phillips type and are used for ternes. Each is furnished with a cleaning machine and a dusting machine is provided for every three pots, so that the handling of the plates is carried out with the greatest rapidity. An automatic steam pickling machine is about to be added, as well as a steam shearing machine. In addition to their regular guaranteed plates, Meurer Bros. Company are now making three qualities of ternes, named respectively Grace, Superior and Standard, as well as Brooklyn coke tins and Florence charcoal tins.

THE TIN PLATE WORKS to be erected at Washington, Pa., by a strong company of New York capitalists, in conjunction with N. E. Whitaker of Wheeling, W. Va., will be a notable addition to the American tin plate manufacturing industry. In addition to rolling mills of ample capacity for the production of black sheets, the tinning department will be one of the largest in the country, including 18 stacks. Work on the buildings will, we understand, be inaugurated at an early date.

G. T. Ewers, 1314 Dolores street, San Francisco, Cal., distributes a circular directing attention to the patent gas burner that he has invented. A feature of it is that that burner closes automatically and there is no danger from the gas being blown out ignorantly or accidentally.

Cheap Heating.

We are now at the season when winter heating apparatus of all kinds goes out of service. A good deal of it, in the natural order of trade, should have gone finally out of service last year; but in view of the panicky feeling which prevailed and consequent attempts to secure unusual economies, it has been made to hold over by various shifts and devices against the desire for newer and better apparatus. Those who find themselves at the end of the heating season with worn out boilers or furnaces will do well to consider at once whether there will ever come a more favorable time for replacing it. All sorts of goods seem to have settled down upon the very bed rock price; and contracting firms with comparatively idle facilities are not only looking around very sharply for more work but are willing to execute contracts at prices quite unprecedented in the trade. It is believed by many that heating contract work will be done in this summer of 1894 more cheapily than it will be possible to get such work done for many years to come. Besides, a worn out heating plant is not economical of money, comfort or health; and when such plants have reached a certain stage of decreptitude they ought to be summarily replaced by new installments.

Good Time for Renewals.

Especially should apparatus for heating schools, churches or assembly rooms be carefully scrutinized now for the discovery and removal of any defects. Such installments usually cost more than domestic heating arrangements; and if it be now necessary or desirable to make expensive repairs or to renew boilers or furnaces the present state of the market is well worth considering by school boards and committees. School heating and ventilation apparatus when out of order exert a deleterious influe ce upon health, especially in overcrowded school rooms. It is almost a crime to neglect the restoration or supply of anything needful for the effective warmiug and ventilating of school buildings, yet many boards and committees are apparently heedless of the state of school buildings under their charge. This indifference, we are glad to say, has been replaced by active interest in many localities during the past few years. But there still remain men who seem to regard a school as a kind of charity institution to be maintained at the lowest possible cost, regardless of sanitary requirements. But if lowest possible cost be now auywhere the controlling motive, and the time has arrived for renewals or repairs, there will not soon be another season in which work of the kind required for schools can be secured at as low a price as it cau probably be secured during the coming summer.

Railroad Progress.

The twenty-fifth anniversary of the completion of the first all rail line across the American continent, which occurred last week, brings to mind the phenomenal progress in railroad building and railroad traveling that has been made in this country during the past quarter of a century. In 1869 there were 47,254 miles of railroad in existence in the United States, while on January 1, 1894, there were in operation 175,223 miles of track, or nearly four times as much. The enormous advance which has developed in the interval in speed and safety, and in the conveniences and facilities of travel, as well as in the rolling stock and general equipments of the roads, is still more remarkable. The number of the traveling public, too, has increased in a still greater ratio thau the railroad mileage siuce the golden spike was driven on May 10, 1869, marking the completion of the first great American transcontinental line. Since that day four more roads have stretched themselves across the continent from ocean to ocean, while others are now in contemplation. What another 25 years may bring forth in the field of railroad progress can only be imagined.

The Cost of Necessaries.

In these times, when the majority of people in the United States are suffering from reduced incomes or shrunken business profits, and when the earnings of workers have decreased, or are temporarily suspeuded by reason of lack of employment, it is some compensation to kuow that never before did it cost so little to live. Food and clothing—the necessaries of life—in particular, have never been so cheap as they are at the present time. So that, while luxuries and superfluities may in many homes have been ruthlessly cut down during the past year of depression, there has been happily little reason for painful retrenchment in the absolute necessaries of existence. The following table, compiled by the *American Grocer*, showing the quantity of different food products which $100 would buy at wholesale rates at different periods for the past 32 years, clearly illustrates the downward tendency of prices for these necessaries:

	1862-67.	1872-77.	1882-87.	1894.
Tea, Japan, ℔...	137	244	454	500
Sugar, ℔.....	606	894	1,333	1,848
Mess beef, bbls..	7	8 2-5	8 2-5	13
Mess pork, bbls.	4.2	5.5	6 6	8.7
Lard, ℔.....	666	909	1,143	1,579
Coffee, ℔	367	518	993	551
Flour, bbls.....	13.7	16.1	15.1	19
Corn, bush.....	120	141	166	175
Bacon, ℔.....	752	990	1,042	316
Butter, ℔.....	294	300	370	351
Molasses, gals ..	188	285	392	800
Rice, ℔.....	800	1,111	1,540	1,750
Starch, ℔.....1,052		1,063	2,273	2,666
Soap, ℔.....	1,000	1,470	2,000	2,500
Potatoes, bush..	98	120	125	154
Salmon, canned, dozen	25	63	85	77
Tomatoes, can'd, dozen.....	40	48	93	108
Corn, canned, dozen.....	33	45½	100	111

Coffee is the only generally used article that shows any material advance. Clothing of the ready made kind may now be purchased at prices which for cheapness compare favorably with those of Europe, and which a few years ago would have been thought chimerical.

The State Department has just issued a series of recommendations from various United States Consular Agents in South Africa regarding the packing of goods for export to that country. Among other advice, the opinion is generally expressed that all goods liable to damage by weather should be packed in cases lined with tin and not merely with water proof paper, the latter not being sufficiently proof against the heavy rains of South Africa. The complaint is also made by importers that oil cases sent from the United States are too flimsy and should be made of heavier tin, in order to stand the rough treatment incidental to the carriage of these goods overland by ox wagons and other primitive methods of transportation.

A high tower is to be constructed at Fredericksburg, a suburb of Copenhagen, by Colonel Somefeldt. It will be 600 feet high. The Danish Minister of War has reserved the right to use the top as a military observatory.

What will be the largest dry dock in the world is now building at Southampton, England. It is to be 800 feet long, 110 feet wide, and will have 27 feet of water over the sill.

THE LETTER BOX.

What Causes Siphonage?

From P. LUMBER, *Connecticut*.—In answer to "Inquirer" in *The Metal Worker* of April 28 as to the cause of siphonage of the fixtures shown and described, I would give the following explanation:

When the closet is flushed it has to draw its supply of air from the vertical 2-inch pipe. It draws with equal force on the contracted 1½-inch horizontal line, or possibly with greater force. When the flushing water reaches the 4 x 2 Y it acts as a piston of a pump and draws the air from the horizontal 2-inch waste pipe, making the second and combined cause of siphonage of the traps of both the bowl and the bath. I would overcome this difficulty by making a separate 2-inch connection from the water closet direct with the vertical air pipe.

Defective Draft.

From J. F., *Willimantic, Conn.*—In *The Metal Worker* of May 5, "W. S." inquires what caused the trouble with a chimney that is 4 x 12 inches, inside measurement. One trouble is that the flue is too narrow. Flues should never be less than 8 inches wide. Twenty-five years as a mason have taught me something about building chimneys. A flue should never be less than 8 inches square, or better 8 x 12, and should be plastered smooth inside. If there are any extra openings for a stove they should be shut when the stoves are removed. I was called to examine a chimney recently, and found three fire places in the chimney. They were closed up with wooden fire boards and the owner thought they were all tight, but in one room there was a bureau against the fire place, and on removing it I found that the fire place had some time caught fire and had a large hole burned in it. It was a wonder that the house was not destroyed. After bricking up this opening the stove which had failed to prove satisfactory operated with excellent results. My customer paid the bill and said it was the best investment he had ever made of his money. Every mason knows that a chimney should be higher than the adjoining buildings or it will be affected by a wind blowing across or possibly down it.

Patterns for Portable Bathtub.

From A. G. K., *Lucknow, Ont.*—I would like to be informed how to obtain the patterns for a portable bathtub, flaring at each end, using trammels or compasses for obtaining the patterns.

Answer.—On page 98 of "The Metal Worker Pattern Book" is presented the method of obtaining the patterns of an oblong tapering article, one end square and one end semicircular, having more flare at the ends than at the sides. The pattern of large end of article is derived from the frustum of a scalene cone, and the method shown for obtaining the patterns will probably fulfill our correspondent's requirements.

Choked Water Backs.

From E. J. Y., *Regina, N. W. T.*—Will *The Metal Worker* inform me of some way to get over my difficulty with hot water connections on kitchen ranges in this locality? We have three ranges connected with upright boilers in the usual way, only in place of water backs we have 6 or 8 feet of 1-inch pipe in a coil over the fire. These pipes block up with a solid coating of a flint like substance in from two to six months, and then burst open. One customer has decided that the expense of renewing is too great, coming as it does every couple of months, and has had the coil taken out permanently. The other customers have their taken out regularly every two to six months. The pipes do good service when clean, heating the water quickly when used. The water used is taken from deep wells on the premises and has some alkali in it.

Answer.—It is needless to point out to our correspondent what he already knows, that the difficulty is the alkali in the water, and that the incrustation in the coils is similar to that which takes place in steam boilers and which is such a prolific source of trouble and expense. For power boilers there are many so-called boiler compounds, the purpose of which is to soften the incrustation by changing its nature, and then when it is in a removable condition the boiler is blown off, cleaning it out. Such applications, however, are entirely impossible in the present case, for the boiler compound would make the water unsuitable for domestic purposes. Our correspondent has to meet this difficulty—that is, the incrustation of a foreign substance on the heating surface—and it remains to be seen how this trouble can best be lessened, for it cannot be avoided. Our suggestion is to make the coils of very much larger pipe. One inch is needlessly small, and while this size gives good quick results through the extended heating surface when the pipes are new, there is but little space to block up with the deposit. Two-inch pipe is small enough for the purpose, and experiments might even be made with larger pipes. By the use of pipe of 2½ inches diameter, for instance, it is evident the choking process will extend over a much longer period of time. On the other hand, it must be remembered that the deposit is a very bad transferrer of heat, and the efficiency of the coil will continually decrease, so that after the pipe has, for instance, a ¼-inch coating on the inside it will transfer heat very sluggishly to the water. This, however, is the best suggestion we can make, for we presume without inquiring that it is impossible to secure a better water supply. Of course, if rain water could be stored and used for the purpose the difficulty would be solved at once. We would like to hear from those of our readers who have had experience with hard waters in kitchen boilers and water backs.

Square and Angle Miters.

From W. D., *Hoboken, N. J.*—Please publish the pattern for angle miter of cornice. I understand square miter, but cannot make profile so as to describe angle miters.

Note.—Our correspondent's difficulty probably arises from the fact that he has learned to draw square miters by the short method—that is, without the use of the miter line. When the miter line is at 45° there is no need of dropping lines to it from the profile and then to the stretchout, for the result is the same as if dropped direct from the profile into the stretchout. When the miter line is other than 45° it is necessary to make use of a plan. Our correspondent will find this method fully and clearly explained on pages 68 and 69 of "The Metal Worker Pattern Book."

Water Pressure.

From W. H. F., *Washington Depot, Conn.*—Please give me through the columns of *The Metal Worker* some rule for ascertaining the pressure in a water main, the fall and size of pipe being given.

Answer.—The rule for finding the pressure of water is to multiply the hight in feet by 0.43, the result being the pressure per pound in square inches. This is the rule that we would recommend to our correspondent, but at the same time we must point out that there are many minor factors omitted. If the water is flowing through a pipe and the pipe is of small diameter the friction will decrease this pressure. The condition of the inner surface of the pipe will also affect the pressure, a rough pipe making more friction. Sharp bends must also be taken into account. We assume, however, our correspondent merely wants a general rule, and the one above given will probably answer his purpose.

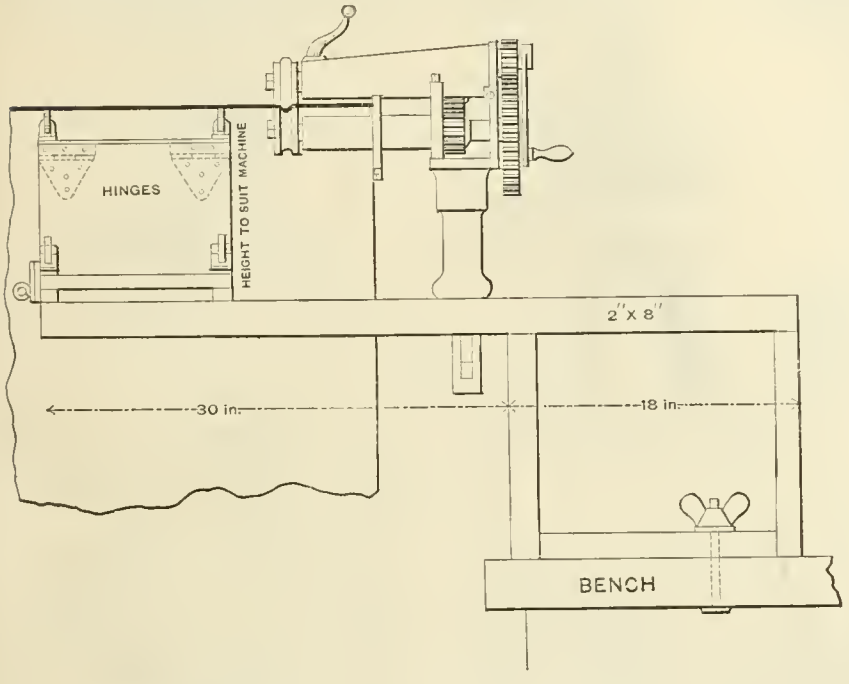
Fire Place Smokes.

From I. G. L., *New York City.*—In reply to the inquiry of "J. A. S.," in *The Metal Worker* of May 12, he can

overcome his trouble to a large extent by stopping off the chimney just below where the flue from the grate enters it.

Swedging Large Furnace Bodies.

From J. J. F., *New York.*—Some of the readers of *The Metal Worker* who swedge large furnace bodies may appreciate what a valuable assistant is found in a device of which I send you an illustration and description. Bodies of from 40 to 60 inches in diameter can be readily swedged by one man when it is used. Mine is arranged to bring the point between the rolls 52 inches above the floor. This is done by setting one end of an oak plank 2 inches thick, 8 inches wide and 4 feet long, on a base made of strong boards, as shown in Fig. 1. The base should be as wide as the plank and about 18 inches long, and should set on the work bench and be fastened to it at the back end by two bolts long enough to go through both and having wing nuts. A hole should be cut in the plank for the swedging machine stand. The hight of the base must be sufficient to make the 52 inches when added to the hight of the work bench and the machine, and if braces are put on each side of the base it will be stiffer. At the outer end of the plank place a piece of inch board 1 foot long and 4 inches wide, supported by two tapering uprights. On each end of the 4-inch strips put a universal caster. The hights of the supports should bring the top of the casters level with the point where the rolls meet and they should be on a line with the roll shaft. On each side of the top strip hinge a piece of board 12 inches wide and 15 inches long and put a universal caster on each of the outer end corners. To each of the hinged boards fasten a piece of iron $\frac{3}{16}$ x 1 inch and 15 inches long by means of a round head screw through a hole in the iron. To let one iron work smoothly on top of the other, a piece of the iron 1 inch square with a hole in it should be put under one of the irons where it is fastened to the hinged board. In the other end of the iron drill $\frac{1}{4}$-inch holes $\frac{3}{4}$ inch apart for half its length. Put a $\frac{1}{4}$-inch hole in the front upright near the bottom and have a $\frac{1}{4}$-inch pin 4 inches long with an eye at one end so that it can be fastened by a cord to the upright. By placing the pin in the holes in the iron and upright, the hinged board can be supported at any hight to make the casters carry heater bodies of different diameters.



Swedging Large Furnace Bodies.—Fig. 1.—*Showing Side View of Apparatus.*

Pearl Gas Stoves.

From R. & B.—Will some one please tell us the address of the makers or New York agents of the Pearl gas stoves?

D. R. Brownlow, Middletown, Conn., has brought out the Perfect curling iron heater and lamp stove. This little device consists of a steel spring support for fastening to the top of a lamp chimney and above it is a heater into which the curling iron is placed. It is arranged so that there is an outlet for the hot gases and surplus heat, thus not interfering with the lamp flame. By opening the cover the stove can also be used for heating and cooking purposes.

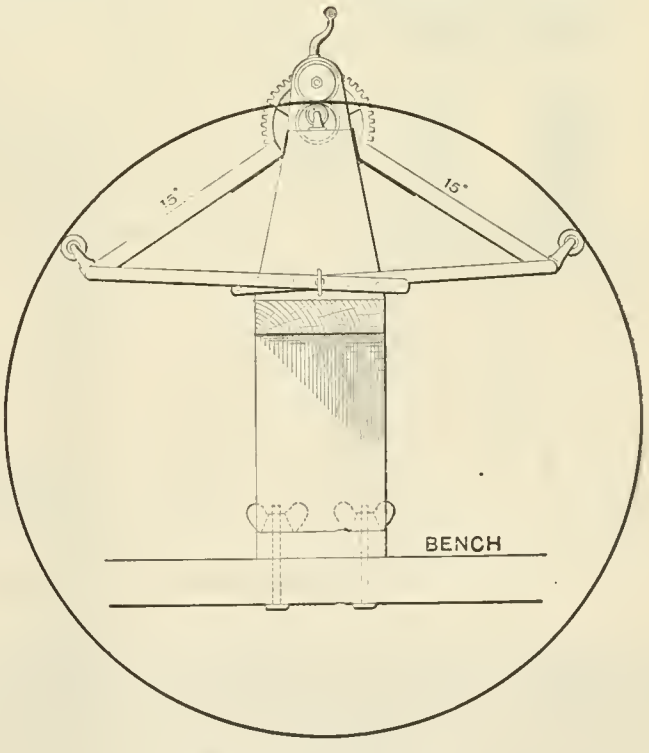


Fig. 2.—*Showing End View.*

Metal Work in India.

The following extract from the "Directory of Indian Manufactures" for 1894, published by the *Indian Textile Journal*, contains some interesting information in regard to the brass and copper works of India: "On account of national and religious customs, brass and copper vessels for cooking, eating, or drinking are to be found in every house, and the workers in those metals are more numerous than those in iron. The hollow ware is nearly all made of imported sheets, which are hammered and brazed into shape. The vessels used for cooking are tinned inside. Brass founding is generally done on a small scale, and a good deal of door, window and other furniture is thus made. The capital towns possess a few larger foundries, which turn out rough hinges and other articles very cheaply. Brass hinges are much used in India on account of the destructive effect of the monsoon rains upon iron hinges, which are never oiled. These foundries have none of the system by which labor is expedited and cheapened as in Europe; gauges and templets are unknown and accuracy ignored. A glance at the import lists of brass work alone would show that a well organized brass finisher's shop would pay a better profit on its capital than any engineer's workshop. There is also a considerable business in hollow ware of hammered sheet iron most skillfully riveted and brazed together. It is much more durable than the imported galvanized iron bucket. The whole of this work is done by hand labor, without the assistance of any stamp or press. Machines were once tried in a Bombay workshop, but as the inferior sheet used would not bear the process, it was abandoned. The experimenter did not know that better sheets were needed for stamping than for working with the hammer. Machinery has thus been condemned as a failure for this particular purpose in Bombay."

Press Working of Sheet Metals.—VI.

BY OBERLIN SMITH.

Curling Process.

Somewhat analogous to forming processes, but involving a new principle not yet herein touched upon, is the operation of "curling" or "wiring," with its various modifications. The two words just quoted as names for this process are used synonymously, although it would be correct to confine the term "curling" to the operation of putting a curled edge upon the top of a pan, cup or other vessel without any wire inside of it, this being often spoken of as imitation wiring. The man who first called it simply "wiring" must have had in mind the boy who took to market an "empty bag with potatoes in it." Real wiring is the same process when done around a ring of wire, which, of course, stiffens the vessel very much more than does the bastard process before mentioned. The latter, however, is cheaper and easier to perform, and often answers a sufficiently good purpose. In Fig. 185 is shown, in vertical axial section, a pair of outside wiring dies for cylindrical work, such as tin cups, dinner pails, &c. This process, it should be mentioned, is usually confined to thin metals like tin plate, sheet iron and sometimes brass and copper, all of which are usually less than $\frac{1}{32}$ inch thick. In such tools the lower die L serves mostly as a receptacle for the work, while the upper die U does the actual curling. Were the dies in question for curling only the loose ring *a* (which is driven to the upward position shown by suitable springs and limited therein by proper stops) might be omitted, the top of the die being solid, as in Fig. 189. As it is, this ring is used to support a wire ring, Fig. 186, which is laid loosely around the top of the uncurled work, Fig. 187, and which creeps down as ring *a* descends by the action of U. At *b* is shown an adjustable bottom upon which the work rests and which is regulated by the screw *c* or its equivalent. This construction enables the same die to be used for various hights of work. In cases where but one hight is required this bottom is made in a solid piece with the rest of the die, as in Fig. 189. In Fig. 188 is shown the finished work as curled without containing the wire ring, such dies being available for making it either with or without the same.

In Fig. 189 is shown a pair of curling dies for outside curling upon the large end of conical or tapered work, such as is shown uncurled in Fig. 190 and curled in Fig. 191. It is suitable for dish pans, milk pans, sauce pans, buckets and such like work. Should it be desired to put in a real wire, the top of

die L is supplied with a floating ring, ss at *a*, Fig. 185. In tapered work like this it is evident that the curling, as it successively passes through the differ- of the tapered work. It is therefore necessary that the curling ring *d* should be detached from the remainder of the upper die, that it may gradually de- being sawed apart radially into perhaps six or eight pieces. These are, of course, properly supported in the main body of U, and are supplied with

PRESS WORKING OF SHEET METALS.

ent stages shown in Figs. 218 to 221 inclusive, must grow smaller in its general diameter, as it creeps down the cone to smaller and smaller diameters crease its diameter as it goes downward in doing its work. That it may thus become a contracting ring, it is made in a number of sections, usually springs to drive them outward as they ascend, so that they will be ready for the next piece of work. It is found in practice that such rings are sufficiently

elastic to approximate nearly enough to a true circle as they are forced into the lower die, and that the slits, if narrow enough, do not injuriously mark the work. The work shown in Fig. 191 fairly represents the body of an ordinary sheet iron bucket. These bodies are usually made up of one or two or more sections, seamed together in lines forming elements of the cone.

In Fig. 192 is shown a pair of dies which are the exact reverse of those just described. They are for curling the small end of conical work, as shown in uncurled and curled conditions in Figs. 193 and 194 respectively. In general, it is found better to confine the work outside for outside curling, and it is therefore placed within the lower die, as a receptacle, in the two former cases above mentioned. In this case, however, it is evident that the work could not be gotten into and out of such a die unless it opened in halves, but experience has proved that work of the kind here shown (which, by the way, fairly represents coffee pot bodies and such like articles) can be successfully curled after being slipped over the hornlike lower die pictured in Fig. 192, which seems to brace the body against buckling better than with straight work, &c. This and other dies of the same bulky character are made hollow merely to save metal, but could, of course, just as well be solid. The curling ring *d* has in this case an expanding rather than a contracting action, and is forced inward by springs, instead of outward, as in Fig. 189. It of course expands automatically as it is driven down upon the work.

In Figs. 195 to 203 and also in Figs. 208 and 209 are shown specimens of what may be called the curiosities of curling. They are combination processes, where two or more pieces, previously made of the proper shape, are assembled and fastened together, as well as given a suitable finish by various operations of curling, &c.

In Fig. 195 are shown the uncurled body, bottom and base ring of a patent coal scuttle, one side only being given and that in "slice section." In Fig. 196 the same are shown in complete section after being curled at one operation, the dies at the same stroke curling the top rim *e*, the triple joint *f* and the bottom rim *g*. Dies for such work are of course very difficult to make, especially as the top of the vessel does not lie in a normal plane, nor in a plane at all, being of the double spiral shape shown. It is, moreover, necessary to use self acting outside clamps to clamp the body securely to the horn, and also to embody vertical motions of the horn itself, and of a clamping device to hold the bottom and base ring in place.

In Figs. 197 and 198 are shown two similar stages of the operation of curling the top of a bucket and putting a bottom thereon, the latter, however, not being a curling operation, but rather a peculiar style of forming, where an upwardly projecting bead in bottom, *h*, is forced to bulge and bend over outwardly by the pressure brought upon it at the same time that the top curling is being done.

In Figs. 199 and 200 are shown similar stages of the operation of putting the bottom in a pail by a different method, consisting of double curling them together at *g*, while the top curl is being made at *e*. In this case a depression, *h*, has been made in the body in some kind of a roller forming machine.

In Figs. 202 and 203 are shown similar successive stages in the operations of putting together a sheet metal cuspidor. The curling at *e*, however, has in this case been done in a lathe, because the taper of the cone (see, also, Fig. 201) was too great for curling dies to work properly. The operations at *f* and *h* consist of a sort of a combined curling and smashing, somewhat similar to that shown in Fig. 198. At *g* and *i* the action is true curling, done in an inward direction.

In Fig. 204 is shown a pair of dies for the inward curling of a plain cylindrical body, Fig. 205, into the condition shown in Fig. 206. Sometimes this process is practicable at both ends of the work at once by double curling dies, and is well adapted for napkin rings, &c. Such dies can, of course, be arranged for real wiring if desired.

In Fig. 207 is shown a pair of dies for putting together by the process of inside curling a body and a bottom, as shown in its successive stages in Figs. 208 and 209 respectively. The function of the spring driven plate *a* in the lower die is to support the bottom when first laid upon it, but it of course descends therewith as the curling proceeds.

In Fig. 210 is shown a pair of dies for the inward curling of the large end of conical work, as shown in Figs. 211 and 212 respectively. In this case the curling ring is of course a contracting one.

In Fig. 213 is shown a pair of dies for the inward curling of the small end of conical work, as shown in Figs. 214 and 215 respectively. In this case the curling ring *d* expands.

Principles of Curling.

In analyzing the principle of the curling process we will find that it cannot be practiced upon the edge of a flat sheet of metal, and that said metal must not lie in a plane but in the surface of a cylinder, or approximately so. It is therefore not practicable to curl or wire rectangular utensils or other articles having a prismatic or pyramidal rather than a cylindrical or conical form. It is true that a curling action might take place at the angles of such pyramids or prisms if they were somewhat rounded off to a curved contour, but at the sides, where the edge followed straight lines, it would simply be bent, as at the top of M, Fig. 216, instead of being truly curled.

In Figs. 216 to 221, inclusive, are shown at U in vertical axial section one side of a broken away curling ring, and at M, in Figs. 218 to 221, similar sections of a piece of plain cylindrical work near its upper end, these latter pictures showing various successive stages as the die U descends in the operation of true curling.

In Fig. 216 is shown the bending action before referred to where the edge of the work lies in a straight line. Or, for the sake of illustration, let us suppose that M is a little bar of metal, standing on end, and say $\frac{1}{64}$ inch thick by $\frac{1}{4}$ inch wide, shown in edge view. It is evident that when this straight vertical bar is struck by the inclined surface of U at the point *a* and below it will be bent outward, but with a long bend, as shown, instead of a short one, as in Fig. 218. This is by reason of the ordinary principles of leverage, which cause a bar to bend as far as possible from the end where the force is applied so as to obtain more leverage for such bending, its starting point being determined in this case by the outside resistance at *b*, which is supposed to be the confining part of the lower die. If the operation is carried a little further the top end of the bar reaches a point in the die at *c*, and there is a general smash, or perhaps it is carried down in some irregular and undesired form. If, however, when it first starts to bend outward it could be confined at the point *d* on its surface and after the extreme end is bent into a short curve it could be again confined at *e*, and still later at *f*, it is evident that it would assume the proper shape and approximately follow the semicircular curvature of the die at *a*, *c*. To illustrate more plainly: supposing that we have a vessel composed of a number of the small bars M, arranged in a circle like the staves of a barrel, and supposing that we have a hoop at *d* which will confine them all until a bend is started at each of their ends, and that then it will expand and another hoop at *e* will hold them until they are again bent, when this hoop in its turn expands—and so on. Such an arrangement would evidently develop a curling operation, and the action described is what really takes place, the metal itself being at the same time its own staves and its own hoops. To prove that a square can could not be properly curled along its flat sides, it is only necessary to imagine a square barrel in which, obviously, the hoops would have but an infinitely small resistance to the expansion of the staves, except at the corners.

With inside curling the holding in action at *d*, *e*, *f*, &c., is due to the compressive instead of the tensile resistance of the metal in a circumferential direction as before. Then by analogy we have the arch instead of the hoop principle, and our little staves become the arch stones.

When the edge of a piece of metal has once been set into a curve of small radius at the extreme edge, and when the forming of the incipient curl thus commenced is gradually continued, as in Figs. 219, 220, &c., there is no action tending to straighten it out again except (in the case of outside curling) the resistance of the edge of the metal to compression as it travels inward from *g* to *h*, Fig. 221. This resistance is not, however, as has been proven in practice, sufficient to spoil the curl, which consequently progresses inward until it strikes the main body of the metal; or, indeed, if the process be continued long enough, until it goes on around in a spiral form, as shown in Fig. 222. With internal curling the circumferential stresses in the edge of the metal as it travels from *g* to *h* are of course tensile instead of compressive, but again are not sufficient to balk the curling propensities existing.

It is evident that as the edge of the metal travels outward from *a* to *c* in external curling, it must be stretched or made longer circumferentially. This, in some cases, is sufficient to crack it in a radial direction at numerous points around it. To guard against this the diameter of the curl must not be too large in proportion to the diameter of the vessel operated upon. Its behavior in this respect depends also upon the thickness and toughness of the metal. If, again, the curl itself is too large in relation to the metal's thickness, the edge does not go in properly from *g* to *h*, as was predicted for it in the last paragraph, and sometimes with the large curling used with real wire it is necessary to roll the edge down afterward in some kind of a burring machine. Especially is this apt to be the case with external curling upon work with considerable taper, like dish pans. The large diameter of the pan, the largeness of the wire which is usually

put in, the greater distance to *h* on account of the taper, and the proportionate thinness of the metal all serve to present bad conditions for true curling.

With internal curling there is less trouble in regard to the points above mentioned, but as the edge of the metal is first compressed and becomes smaller in traveling from *a* to *c*, it must be expanded and stretched in completing its journey from *g* to *h*. If tough enough it will go all right; if not, otherwise.

In practical work it is found that with ordinary tin plate and sheet iron a curl of from $\frac{3}{32}$ to $\frac{3}{16}$ inch can be obtained, according to various conditions above indicated. For larger curls to be successfully made, much thicker metal might be required.

The pressure necessary for curling is usually small, it being quite possible to do work of this kind upon tin plate in an ordinary foot press to 1 foot or more in diameter. The ram speed in running curling dies is immaterial, there being no limitations in this respect as presses are ordinarily run. The kind of press used is also immaterial, except that it must have hight enough for the depth of the dies, which is usually much greater than for work of other kinds, plus the depth of the work itself, so that it may be inserted between them and then dropped into or on to the lower die. This is assuming the lower die to be fastened to the press bed in the ordinary way, and would, of course, involve a very long stroke to the ram. In practice, however, except for very shallow work, the lower die is usually mounted upon a sliding or swinging table, which is brought forward each time the work is to be removed and replaced. It is then pushed backward under the upper die, which need have but an ordinary stroke of from 1 to 2 inches, according to the character of the particular dies in question.

Horning or Side Seaming.

Somewhat germane to the subject of curling and wiring, inasmuch as it is used in preparing utensil bodies for that process, is the operation of horning or side seaming. This also is an assembling process where two or more pieces are fastened together by press work, and is analogous to some of the putting together operations described a few paragraphs back.

In Fig. 223 is shown a front view of a round horn, L, which is, of course, in reality a lower die, and of an upper die, or so called "force," U. These, as shown, are adapted for closing down a side seam upon a cylindrical or conical body with an outside projection, as in Fig. 227.

In Fig. 224 are shown a horn and force adapted for square work, rather than round. In this case the horn is grooved and the face of the force is flat, thus adapting it for an internally projecting seam like that in Fig. 226. Either form of seam can, of course, be made in either round or square work.

In Figs. 225 and 226 are shown the successive stages of an ordinary lock seam, the first showing it loosely hooked together, the hooks having been previously formed separately; and the second showing it after being struck and smashed down solidly together in the press. In Fig. 227 the same thing is shown, but with the seam projecting outwardly, as before mentioned

In Figs. 228, 229 and 230 are shown, more as a curiosity than anything else, three successive stages of a peculiar patented seam which the writer once designed a special press for, the ram being supplied with three different dies, which put themselves in position successively during three quick blows which the press gave before stopping. The horn also was provided with an automatically changing lower die. The work was placed in the machine without hooks, as in Fig. 228, the three successive blows putting it first into the shape 229, then into 230, and finally smashing it so that it looked pretty much the same as Fig. 226. This seam was a success mechanically, especially for thin metals, although somewhat wasteful. For some reason unknown to me the owners have never put it upon the market.

There are numerous other forms of special seams which do not appear to have come into practical use, and there are also some machines for making automatically the ordinary locked seam first described. These, however, it will hardly be worth while to describe here.

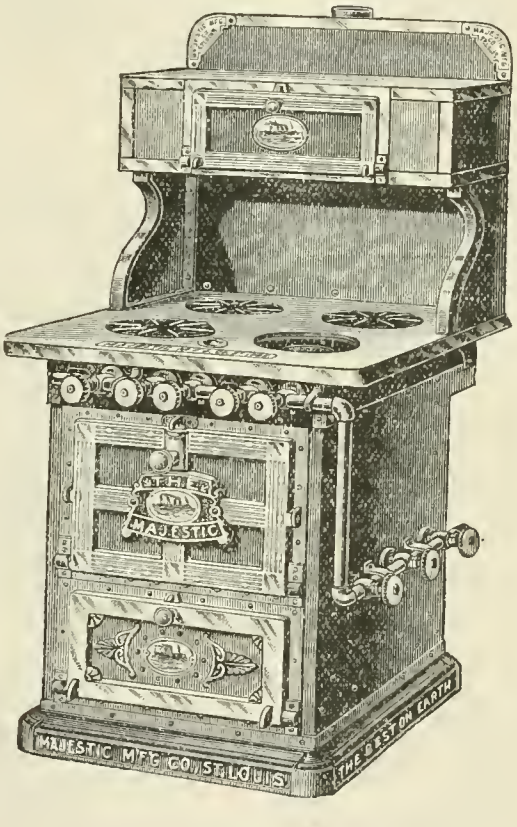
The speed used in seaming work is immaterial, although a quick hammer like blow would do the most good with a given press. The pressure required is considerable, and, within the limit of the metal's crushing strength, I should say the more the better. Again, we have no pressure measurements worthy of record.

The presses used for horning are usually special, with the projecting bed omitted from the frame, and in lieu thereof special means for inserting or otherwise fastening on horns of various sizes and shapes. For certain small work ordinary presses can be used, with horns mounted upon properly adapted bolsters.

Thomas Nevins & Son, contractors, of Orange, N. J., have contracted to purchase the entire street surface railway system of Detroit, Mich. The lines are 80 miles long, of which 30 are trolley lines. The purchasers intend to equip the system throughout with trolley lines as well as to extend it. This is one of the largest contracts in the history of electric roads.

Majestic Gas Range.

The Majestic Mfg. Company, St. Louis, Mo., have added to their already extensive assortment of gas burning appliances a new line of ranges known under the name "Majestic." These goods are made with body and oven of cold rolled steel, the oven doors, frames, hinges, stakes and handles of malleable iron, while other portions are of the best gray iron. All parts of steel and malleable iron are firmly riveted together. The illustration which we present herewith shows one of the varieties in which this line is offered to the trade. The oven is 18 inches wide, 18 inches deep and 12½ inches high, the roasting and broiling oven being of the same width and depth, but 10 inches high. The top surface of the stove measures 24 x 28 inches, and is provided with three single burners and one double burner. The air mixers are provided with cut offs admitting more or less air, as may be required. The oven is heated by inverted twin burners, which are said to produce a flame nearly sky blue in color, thus economizing fuel and utilizing to the full extent the products of combustion. All the flues are lined with asbestos board. One form of range has an attachment in the shape of a 10 gallon copper reservoir, planished outside and tinned inside. There is also provided an improved shelf warming oven, which is heated by placing a hollow cone over one of the rear burners and thus conveying the heat to the under side of the oven.



Majestic Gas Range.

In some of the agricultural districts of Pennsylvania the demand for small farms is said to be greater than has been ever before known.

PLUMBING and GAS FITTING.

Texas Master Plumbers.

The fifth annual convention of the Texaa Master Plumbers' Aasociation was held May 9 at the Hutchins House, Houston, with a good attendance of delegates from the leading cities. The association was called to order at 1 o'clock. W. W. Otter, president of the local association, introduced Mayor John T. Browne, who in an appropriate address of welcome tendered the members of the association the hospitality of the city. President May in a befitting manner reaponded on behalf of the asaociation.

The Executive Committee was appointed a Committee on Credentials and reported the following cities repre aented: Austin—W. A. Burke, Teagarden & Co. Dallas—F. A. Campbell, D. F. Sullivan, S. C. Carroll, Ed. S. Davis. San Antonio—A. H. Shafer, Ed. Braden, Jr., Rudolph Strohmeyer. Corsicana—F. S. Brooks. Fort Worth—Geo. D. Ackley, J. F. Osborne, George Preuitt, J. B. Austin, Jas. Barry. Houston—W. W. Otter, R. B. Morris. Galveston—D. J. May, Paul Shean. Waco—J. S. Brazelton. Sherman—J. F. Madden, O. F. Johnson. Tyler—Thomas Henderson.

The officers elected for the ensuing year are: President, Ed. Braden, Jr., of San Antonio, vice-president; W. A. Burke of Austin; secretary, J. F. Osborne of Fort Worth; treasurer, A. H. Shaper of San Antonio.

Executive Committee—R. B. Morris, chairman, of Houston; D. J. May of Galveston and W. W. Otter of Houston.

Delegates to the National Convention—President, Ed. Braden, Jr., *ex officio*, of San Antonio; George D. Ackley of Fort Worth; A. H. Wainwright of Galveston; J. F. Madden of Sherman and Thomas Henderson of Tyler. The delegates go uninstructed.

A committee was appointed to revise the conatitution and by-laws and put them in such shape that they can be published in pamphlet form for the use of members of the association. This committee had a lengthy meeting and a general diacuasion over the proposed work.

The local aasociation gave a banquet at the Hutchins House in honor of the visitors.

Massachusetts Master Plumbers.

The annual meeting of the Massachusetts State Association of Master Plumbers was held at the Hamilton House, in Holyoke, last week. There were about 100 peraons preaent, including 64 regularly accredited delegates from local associations. The officers of the association met early in the forenoon, but the main body of the membera did not arrive until nearly noon. The seasion was devoted to the election of officers and a few technical details of work connected with the business represented, and a fine dinner. In the absence of the president of the association, Vice-President Jordan of Worcester presided and Daniel Shannon of Boston was clerk. Charles H. Tower of Holyoke was chosen sergeant at arms for the session. T. J. Carmody of Holyoke was chairman of the Committee on Credentials, and it was found that 64 were properly accredited. The report of the treasurer showed receipts of $218 and expenses of $119 in the year.

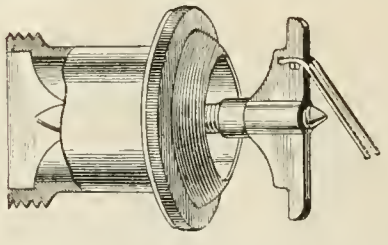
After the preliminary business adjournment was taken for dinner. The association went into executive session after dinner and discussed matters of interest only to the members. The committee appointed at a previous meeting to prepare a bill governing plumbing methods and secure its passage by the Legislature reported that the matter was progressing favorably. These officers were elected for the ensuing year by unanimous vote: President, W. H. Mitchell of Boston; vice-president, J. W. Green of Worcester; recording secretary, Daniel Shannon of Boston; financial secretary, C. P. Lyman of Holyoke; treasurer, E D. Casey of this city; Executive Committee, J. W. French of Boston, T. J. Gifford of New Bedford, R. E. Fogwell of Fall River, J. F. Davelin of Somerville and O. S. Kendall of Worcester.

T. J. Carmody and D. D. Casey were chosen delegates to the national convention, and C. P. Lyman and J. F. Kennelly alternates. The association will make an effort to organize the various associations throughout the State.

Votes of thanks were passed to the officers and the Holyoke association for the work that they had done in preparing for the meeting, which then adjourned.

Closet Repair Coupling.

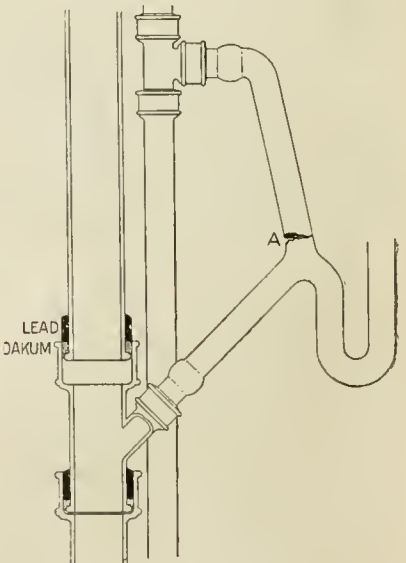
In a recent number of *The Metal Worker* appeared an illustrated description of a closet repair coupling introduced by Savill, Walla & Co. of 1229-1231 Budden Row, Philadelphia. The accompanying illustration shows another coupling put on the market by the same firm and designed for use where the old supply pipe and coupling are to be utilized, thus obviating the necessity for any change in the fitting of the closet. The coupling consists of a brass supply arm having a flange at one end over which fits a rubber washer with a raised tapered center. A T headed brass locking bar, screwed at its end, passes through the center of the arm and engages with a brass cross bar to which is attached a spring. The outer end of the arm is screwed with a 1¼-inch iron pipe thread, and its inner surface is recessed in order to provide a seat or stop for the head of the locking bar. In use, the cross bar is removed from the locking bar and inserted in the waterway or flushing rim of the closet; the supply arm is then placed in position and the locking bar passed through it and screwed by means of the T head into the cross bar until the recess or seat in the arm prevents further turning, when a tight and flexible joint will have been effected. The coupling may also be used on new or old closets where an economical and flexible coupling is required. The coupling is made in two styles, screwed for iron pipe, as in cut, and plain for lead pipe.



Closet Repair Coupling.

Defects Discovered by a Smoke Test.

The accompanying illustration shows a part of a plumbing system brought to our notice by Boyd & Schnaier, 347 Columbus avenue, New York, and found in a residence where they made a smoke test. The defects shown were in different parts of the building, but for convenience they are connected in the illustration. In each ample opportunity is afforded for the entrance of sewer air. The first defect and the one more likely to happen is due to the settling of the soil pipe. The lower section of the pipe had settled sufficiently to almost entirely draw away from the upper section, so that the lead which had been calked in the joint to make it tight was nearly drawn out, leaving nothing but the oakum to prevent the entrance of sewer gas. Under the test smoke freely came through this joint. The settling in the soil pipes below the fixtures is more probable than in the pipe above them, from the fact that the lower pipe has to support more or less of the weight of the upper pipe and resist the force of the water which is discharged into it. A



Defects Discovered by a Smoke Test.

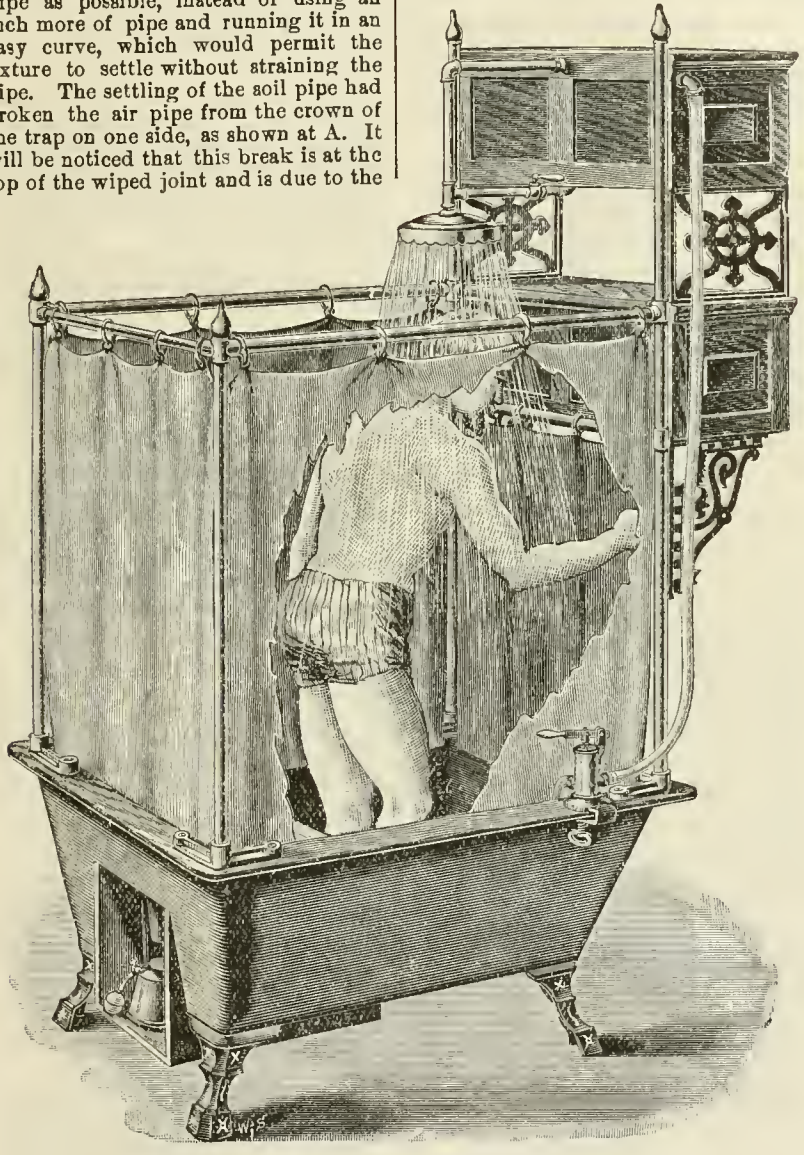
continuous downward blow is struck on the side of a pipe by the discharge of water from a water closet, which can be estimated at several pounds, and for a period of a minute or more, according to the size of the flush tank, from which some idea can be gained of what causes such pipes to settle. In buildings where the fixtures are used frequently the probability of the pipe settling becomes greater.

The other leak is shown at the crown of the trap under the lavatory and is due to two causes: In the first place the plumber in making a neat looking job, and to save pipe, runs the back air pipe as direct to the main ventilating pipe as possible, instead of using an inch more of pipe and running it in an easy curve, which would permit the fixture to settle without straining the pipe. The settling of the soil pipe had broken the air pipe from the crown of the trap on one side, as shown at A. It will be noticed that this break is at the top of the wiped joint and is due to the care of the plumber to do a neat job. In soiling this pipe and shaving it for the joint, in order to have a clean, well defined line around it, in all probability he used his dividers to mark the line around the pipe, and in doing so made a deep scratch in marking the pipe. This scoring made a weak point in the pipe. It has been clearly shown by experiment that an ordinary scratch on a piece of sheet lead will cause it to break along that line very regularly, while a piece of sheet lead that has no mark on it when pulled apart would require more force and would show a very irregular and ragged fracture.

The Smith & Anthony Company, 56 Beekman street, New York, in addition to their line of Sanitas plumbing appliances, are showing samples of the Oswego Indurated Fiber Company bathtubs and foot baths. In one of their windows a new attraction is an Italian marble lavatory fitted with bronze Sanitas trap, and bronze pipe with a patent Sanitas basin waste and red metal basin cocks.

Combination Bathtub.

We show in the accompanying illustration a combination bathtub made by the Ette & Henger Mfg. Company, St. Louis, Mo. The bath, it will be noticed, is self heating, and in addition, the manufacturers point out, will give, singly or in combination, any of the following baths: Hot water, cold water, hot air or steam, dry or wet vapor, alternating hot or cold, or plain, perfumed or medicated, spray, douche, syringe or bidet baths, and in addition has an adjustable stool with comfortable lazy back, which by a simple arrangement will automatically rub the back with either brush, sponge, towel or electrode. The heating is done either by a gas or gasoline heater adapted to heat from 12 to 18 gallons in from 15 to 20 minutes. The tubs are made of aluminum and polished inside and outside and with similar trimmings and hardwood finish to suit. The general baths are made of cast iron, painted with a special enamel to resist heat, and with trimmings of brass, nickel plated, and hardwood finish in imitation of cherry. Water can be brought to the tubs by pipes or buckets, or can be pumped from cisterns, if not too far off, by the pump clamped on to the rim of the tub. The bath illustrated has a vapor curtain.



Combination Bathtub.

Pipes and Electricity.

Plumbers will be interested in the following conclusions given by Isaiah H. Farnham in an exhaustive paper on the destructive effect of electrical currents on subterranean metal pipes, which was read before the American Institute of Electrical Engineers:

1. All single trolley railways employing the rails as a portion of the circuit cause electrolytic action and consequent corrosion of pipes in their immediate vicinity, unless special provision is made to prevent it.

2. A fraction of a volt difference of potential between pipes and the damp earth surrounding them is sufficient to induce the action.

3. Bonding of rails, or providing a metallic return conductor equal in sectional area and conductivity to the outgoing wires, is insufficient to wholly prevent damage to pipes.

4. Insulating pipes sufficiently to prevent the trouble is impracticable.

5. Breaking the metallic continuity of pipes at sufficiently frequent intervals is impracticable.

6. It is advisable to connect the positive pole of the dynamo to the trolley lines.

7. A large conductor extending from the grounded side of the dynamo entirely through the danger territory and connected at every few hundred feet to such pipes as are in danger will usually insure their protection.

8. It is better to use a separate conductor for each set of pipes to be protected.

9. Connection only at the power station to water or gas pipes will not insure their safety.

10. Connection between the pipes and rail or rail return wires outside of the danger district should be carefully avoided.

11. Frequent voltage measurements between pipes and earth should be obtained, and such changes in return conductors made as the measurements indicate.

In closing this somewhat rambling paper, I can do no better than use words which will remind you of Patrick Henry—"eternal vigilance" will be the "price" of pipes and cables where conditions favorable to electrolysis exist.

TRAPS AND VENTS.

Garrett D. Voorhis died at his residence at Paterson, N. J., at the age of 64 years, last Monday. He had carried on a stove and plumbing business in that city for a number of years. He was a director in the First National Bank and the Paterson Savings Institution. He was also an active worker in the Young Men's Christian Association, having recently donated $1000 to its building fund. He is survived by a widow and a daughter.

The American Tube Works, Boston, Mass., are sending out a 34-page pamphlet devoted to their seamless drawn brass pipe for plumbing. It gives a list of sizes and weights and states that they are tested to a hydrostatic pressure of 1000 pounds per

square inch. This is followed by a brief description of the pipe, and the remaining 24 pages gives the names of prominent plumbers in different cities who have used the brass pipe and a number of public buildings and private residences in which it has been put.

A. A. Caswell and John Dickson have formed a copartnership and entered into the plumbing business with headquarters on North street near the junction of Essex, Salem, Mass.

Samuel A. Stevens, the veteran plumber, at Salem, Mass., has retired from business, and has been succeeded by Staten & Tyler.

George M. Ellis has purchased his partner's interest in the plumbing, steam and gas fitting business of Ellis & Hull, at 258 Franklin street, Norwich, Conn., and will continue the business himself.

At the last meeting of the Master Plumbers' Association, held at their meeting rooms, Builders' Exchange, 19 West Saratoga street, Baltimore, Md., the following officers were elected for the ensuing year: E. J. Healy, Jr., president; P. T. Barry, first vice-president; G. W. Addison, recording secretary; C. H. Frederick, financial secretary; D. N. Sullivan, treasurer. The following delegates were elected to represent the association at the thirteenth annual convention, to be held at Detroit, Mich., June 19 next: John Trainor. W. H. Rothrock, Geo. Knipp, H. C. Bowman, E. J. Healy, Jr., J. F. P. Carey, D. N. Sullivan, C. H. Frederick.

Chapter 419, section 114, of the Massachusetts laws of 1892 provides that "every school shall have at least one water closet or privy for every 20 persons therein attending. . . . Privies or cesspools shall not be allowed when a sewer makes water closets practicable." The citizens of Roslindale are remonstrating against the use of a school building which has but two water closets for 100 pupils.

Jarratt & Abel are a new firm at Macon, Ga., who will carry on a plumbing and tin business. The firm is composed of R. P. Jarratt, who established the business, and F. T. Abel, who has purchased an interest.

The Common Council of Pawtucket, R. I., have passed a new ordinance in reference to plumbing in that city.

N. Meredith has removed his plumbing shop from Church street to 5 South Perry street, Johnstown, N. Y.

The firm of Snoddy & Cook, plumbers, Hamilton, Conn., have dissolved.

James Chapman, a practical plumber, recently in the employ of John Downing, has engaged in business for himself with shop at E. E. Johnson & Son's stove store, South Laurel street, Bridgeton, N. J. He will do all kinds of plumbing and steam and gas fitting.

The Highgate Museum of Sanitary Appliances, in London, to which reference has several times been made, is being utilized in a very practical way for the benefit of plumbing and other students, classes of whom from trade and technical schools visit the museum from time to time and are there given lectures on sanitary subjects, illustrated by the object lessons at hand.

The Plumbers' Registration Bill which has been experiencing a troubled passage through the British House of Commons, owing to the opposition of the ironmongers, whose "side line" interest in plumbing was threatened, is now awaiting the second reading in the House, with a good chance of passing into law. The promoters of the measure have inserted a clause giving registration without examination to ironmongers now engaged in the plumbing business, and the block placed in its way by the influence of that trade has been withdrawn. The bill has still some other obstacles to contend with, however, and unless these are removed it may not pass in the present session of Parliament. The Braziers and Sheet Metal Workers' Union object to some features of the bill, and these objections are now under consideration by the promoters.

"We use nothing but absolutely pure lead in the manufacture of our lead pipe, and pure lead and pure tin in the solder that we sell," is the claim of the National Lead Works of 287 Pearl street, New York.

Denny Brothers, 36 Park place, New York, are issuing a 20-page catalogue of Denny's Imperial gas machine. The book is profusely illustrated with cuts showing the method of applying their machine for manufacturing gas to residences and buildings in localities where there are no large gas works. A full detailed description is given of the operation and working of the machine and the method of setting it up for use. It is stated that their gas may be used equally well as coal gas for mechanical and heating purposes. A cut is shown of their Imperial gas burner, designed for use in connection with gas machines. The book also shows the Dunning steam and hot water boiler for house heating, for which they are the New York agents.

A meeting of the Executive Committee of the Illinois Master Plumbers' Association will be held Monday, May 21, at 10 a.m., in the rooms of the Chicago Master Plumbers' Association, 197 Madison street, to arrange for a convention of the master plumbers of Illinois to consider means of increasing the membership of the State Association. Invitations to attend have been extended to the executive committees and presidents of local associations throughout the State.

The following delegates have been elected to represent the Master Plumbers' Association of Philadelphia, Pa., in the national convention of plumbers, to be held at Detroit, beginning June 19: William McCoach, William H. Doyle, George F. Uber, Frank P. Brown, John E. Eyanson, William L. Owens, William Harkness and Samuel W. Barnes.

E. Raymond, one of the representatives of Henry Huber & Co., 81 Beekman street, New York, is well known to the plumbing trade in New York and vicinity. Having had several years' experience with a kit of tools, he is well qualified to present the merits of the plumbing goods manufactured by his house. On water closet construction he is well informed and thinks that the Americans are far in advance of all competitors in the design and finish of earthenware closets.

Patrick J. Hart and Daniel E. Shea have opened a plumber's shop at 10 Putnam street, Fitchburg, Mass., under the firm name of Hart & Shea.

The plumbing firm of Honan & Leddy, New Britain, Conn., are open for business.

Last Saturday evening Frank A. Wendell opened his new plumbing establishment in the Kinsman Block, Salem, Mass. A large number of visitors inspected an endless variety of articles used in the business. One of the most attractive portions of the exhibit is in the front window, being a complete bathroom, arranged according to the latest ideas. Hot water heating apparatus is set up and shown as in use, with radiators, &c. An elegant line of gas and electric chandeliers with handsome lamps is also exhibited, with globes of all kinds, faucets and kindred articles. A complete outfit for a dwelling house, as far as plumbing is concerned, is in operation. Mr. Wendell has an office in the front of the store, with speaking tube connections with the work rooms, which are located in the rear and in the spacious basement.

The Hartford Association of Master Plumbers has elected the following officers for the ensuing year: President, George Mahl; vice-presidents, Edward Mahl, Thomas Oakes; recording secretary, J. J. Lawler; corresponding secretary, George S. Bull; treasurer, E. Lawler; financial secretary, W. B. Hogan; sergeant at arms, Charles Murray.

Alex. Murray has opened a plumbing and gas fitting store in Newburg, N. Y.

Chicago Delegates.

The Chicago Master Plumbers' Association, at their regular meeting on the evening of the 14th inst., elected the following delegates to attend the annual convention of the Master Plumbers' Association of the United States, which will be held next month in Detroit:

Delegates.	*Alternates.*
C. J. Herbert.	D. M. Quay.
P. Sanders.	R. B. Finn.
T. P. Culloton.	Thos Conlin.
G. A. Larson.	John Sanders.
Thos. Conway.	Chas. Byrne.
Chas C. Breyer.	J. H. Killian.
D. J. Rock.	David Whitford.
P. M. Murphy.	A. F. Irons.
A. C. Hickey.	Jno. Gannon.
John G. Roland.	P. J. Morrisey.
Jos. B. Breen.	T. C. Boyd.
M. L. Mandable.	J. H. Beam.
E. Baggot.	J. A. Voltz.
Jas. H. DeViney.	J. C. Cederholm.
Jas. H. Roche.	J. Nelson.
W. H. Cummins.	M. J. Carboy.
A. W. Murray.	
Jacob G. Weber.	
J. J. Doyle.	
B. H. Lear.	
J. P. Neurberg.	
C. J. Boyd.	

Additional Chicago delegates by virtue of their office are the following: Andrew Young and Robert Griffith, ex-presidents of the National Association; J. J. Wade, member of the national Executive Committee; W. T. Geary, State vice-president; Paul Redieske, president Chicago Master Plumbers' Association.

Clement A. Griscom, president of the American Steamship Line, describes the prospects for transatlantic cabin passenger traffic this year as being favorable for a better business than last year, although any large increase is not expected. The prospects for steerage business he thinks are not so satisfactory.

The shareholders of the Panama Canal Company, at a recent meeting in Paris, appointed a committee to establish a new company for the purpose of completing the canal.

STEAM AND HOT WATER.

Master Fitters' Convention.

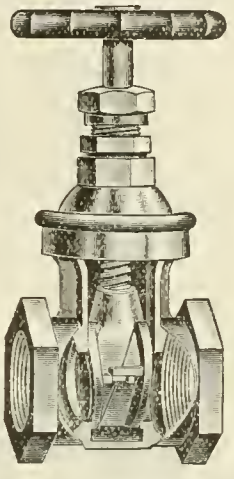
The following call for the sixth annual convention of the Master Steam and Hot Water Fitters' Association of the United States will be mailed generally to steam fitters and manufacturers about June 1. The call is signed by the Executive Committee, consisting of J. L. Wells, James Curran, Andrew Mercer, E D. Smith and J. D. Clarke; also by President E. Rutzler and Secretary Geo. H. Reynolds, whose address is the Broadway Central Hotel, New York:

The sixth annual convention of the Master Steam and Hot Water Fitters' Association of the United States will be held at the Broadway Central Hotel, New York City, commencing Tuesday, June 19, 1894, at 10 o'clock, a.m. A cordial invitation is extended to all master fitters to attend this meeting, whether members or not. We urge each and every one who receives this communication to make inquiry of others of the craft and to advise any whom this has failed to reach that they are included in the invitation. Reading of papers by members has been an attractive and successful feature of our last two conventions. By referring to the various trade journals you will see our announcement giving subjects and authors of articles promised for this annual meeting. New York City with its diversified interests is attractive at any season of the year. On June 15 the numerous summer resorts in and about the city will be open to the public and can, after final adjournment, be visited by those who desire to do so. The Broadway Central Hotel is located on Broadway, between Bleecker and Third streets, and is in its appointments well adapted for holding conventions. The accommodations are first-class and ample. For rates see return postal card, which please fill out and mail. Railroads have granted full rates going and one-third returning by same route. Secure your certificates when buying your tickets and have them properly indorsed at the meeting. Local ticket agents will be instructed and can give full information. The usual entertainment will be arranged for the ladies, which we hope they will be here in increased numbers to enjoy. Those desiring to make exhibits of their goods at the convention can get particulars by addressing the proprietors of the Broadway Central Hotel. Many have already secured space, which emphasizes the importance of the meeting.

THE HERENDEEN MFG. COMPANY, Geneva, N. Y., distribute circulars illustrating the Furman Junior hot water boiler. A general view is shown of the apparatus, together with interior and other views. The Furman Junior is adapted for supplying hot water for conservatories, small dwellings, baptisteries, poultry houses, stables, bathtubs, carving tables, laundries, &c. The water section is cast in one piece and no brick work is required.

Diamond E Gate Valve.

The gate valve shown in the accompanying cut is placed on the market by Ette & Henger Mfg. Company, St. Louis, Mo. In construction, the principle of the body and disk is of the usual order, but having a diamond shaped wedge, tapered and higher in



Diamond E Gate Valve.

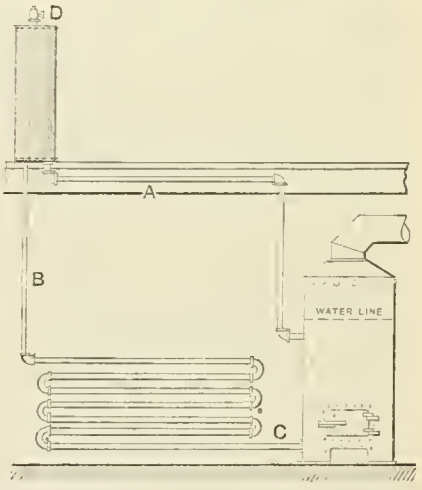
the center than at the ends to insure a perfect seat and to overcome grinding. It is stated that each valve is tested to 300 pounds pressure and guaranteed to be perfect in all respects. These are made in regular sizes from ½ inch to 6 inches.

The Raymond & Campbell Mfg. Company

of Middletown, Pa., have just issued a 102-page catalogue descriptive of the Lindemuth Sun steam and hot water heaters. The catalogue is oblong in shape, and appears in buff paper covers, the front page bearing a lithographed title, with a cut of the boiler on an outstretched hand, and the motto: "The Pride of the World." The first inside page bears the company's card with a list of their agencies and a view of their works, the latter contained within a scroll of handsome design. The second page is taken up with an announcement declaring that the aim of the company is to build and place on the market a superior article embodying the features most desirable in a heating boiler. The catalogue proper leads off with a description of the advantages of the Sun and the details of its construction, and there are shown illustrations of the base and fire box, drop tubes and top; other cuts show the position of the fire tubes as located in the water and steam space, and the method of placing and the position of the fire tubes and drop tubes. The Sun steam boiler is described at length and fully illustrated, and the qualities of the Sun as a heavy duty or closed tank system hot water circulator ably enumerated. The Lindemuth Sun steel sectional steam and hot water boiler is also shown, and the difference between its construction and that of the regular boiler explained. Page 16 shows the adaptability of the Sun as a brick set heater, and two diagrams are furnished in demonstration of same. About 20 pages are devoted to price-lists of the boilers, heating supplies, a telegraph and cable code, and directions for the proper attachment and use of the thermometer recommended for service with the boilers. The remainder of the book is taken up with *fac-simile* testimonials received from users of the boilers, and upward of 80 photographic reproductions of the houses and buildings to which the testimonials refer.

Hot Water Heating From Steam Boiler.

From REX, *Rochester, N. Y.*—The heating of hot water radiators from a steam boiler may be a novelty to some



Hot Water Heating from Steam Boiler. —Fig. 1.—Radiator Below Water Line.

of the readers of *The Metal Worker*, but it is sometimes done. It is a practice to which there are objections, however

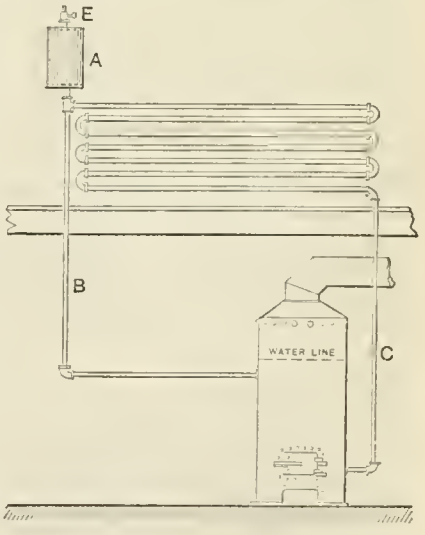


Fig. 2.—Radiator Above Water Line.

and should only be used to meet special requirements. Fig. 1 shows a radiator placed below the water line in the boiler. Fig. 2 shows a radiator above the wate

line in the boiler and when so placed the piping must be perfectly air tight. The air must be exhausted from the air chamber in both systems. One of the objections to this kind of heating is the difficulty experienced in keeping the system air tight. If not kept air tight there will be no circulation except when the steam pressure is sufficient to raise the water into the air chamber. In Fig. 1, A shows the flow pipe to the air chamber, D is an air cock and B showa the pipe from the chamber to the radiator and C shows the return to the boiler. In Fig. 2, B is the flow pipe, A is the air chamber, E is an air cock and C is the return pipe from the radiator. The heating of the water for the radiator will detract from the capacity or rating of the boiler about the same as though the radiator was heated by steam under the same conditions.

Note.—As an unusual practice the method shown will be interesting to many of our readers. There are doubtless other methods of doing the same thing and we hope those who have such systems at work will send us sketches and description.

HEATING NOTES.

The Standard Radiator Company, Buffalo, N. Y., issue some neat and tasteful circulars relating to the goods of their manufacture. One is given up to the Standard indirect radiator for steam or hot water. A half-tone engraving shows the appearance of the radiator and a few descriptive particulars accompany the cut. The three other circulars of which we have received copies relate to the New Standard radiator for steam or hot water and the Standard radiator for steam or hot water. The new Standard is likewise illustrated on a special heavy card which presents a half-tone engraving of the radiator and the name and address of the company.

The Smith & Winchester Company, Boston, Mass., send out circulars to the trade announcing the decision in the competition respecting the name of their new heater. The name selected by the judges is Winchester, this name being suggested by 52 different persons among the competitors. The first one received was from Charles O'Grady, Marlboro, Mass., who is entitled to the heater which was offered as a prize. Nine hundred and forty-two replies from the trade suggesting names were received and 329 different names were the result. The Smith & Winchester Company send out a letter giving the decision of the judges and a list of the names to the trade. The new heater is constructed entirely of cast iron, the water connections being made by screw joints, being furnished with an anti-clinker dumping grate, and is an easily erected apparatus. The manufacturers will soon issue a catalogue containing a full description of the Winchester, with cuts, and they hope to be able to fill orders by about June 1.

William Campbell, formerly of the Detroit Heating & Lighting Company of Detroit, Mich., and latterly manager of the steam and hot water department of the house of Sherman S. Jewett & Co. of Buffalo, N. Y., has accepted the management of the steam and hot water department of the Carton Furnace Company, Utica, N. Y., and Chicago, Ill., and will assume his duties at once. Mr. Campbell has had an experience in this line of business for the past 32 years, both in this country and abroad.

C. F. Bachler of 49 North Seventh street, Philadelphia, general agent for the Monitor wrought steel coil boiler, is sending out a folder containing a list of buildings and places where Monitor boilers are in use. The list is 9 feet long, and is contained in a stiff paper case, on the outside of which appears Mr. Bachler's card, and on the inside sectional and other views of the boiler.

The Board of Trustees of the Soldiers' Home, at Roseburg, Ore., selected and specified a Royal hot water heater for heating the home, which, as stated in *The Metal Worker* April 28, will be installed by the Dugan Bros. Plumbing & Heating Company of Salem, Ore. This firm, we understand, handle the boilers of the American Boiler Company, and install them unless the specification calls for some other apparatus.

Henry A. Gouge of the Gouge Heating & Ventilating Company, 47 Beekman street, New York, has just returned from Washington, D. C., where he had been consulting with some experts on the ventilation of the Houses of Congress with a view to securing better ventilation.

The John Simmons Company, 106–110 Centre street, New York, are sending the following letter to the trade: "Having leased the building 7 and 9 Franklin street, in rear of above address, and greatly enlarged our stock of cast and malleable iron fittings, including all reducing sizes, both in black and galvanized, erected a large pipe warehouse at 381 South street, besides adding to our equipment of pipe cutting machines and increasing the facilities of our machine shop, we believe we have unequaled facilities and are now in a position to sell at the lowest possible prices, while at the same time we propose to keep up the standard of our goods, on which we have made our reputation. We carry in stock standard full weight pipe, extra heavy fittings, valves, &c., specially adapted for mills, factories, refineries, and such as are used in steam, water, gas, oil and electrical engineering. We carry a full line of steel pipe specially adapted for bending. We invite your correspondence, or would be pleased to have you call on us for prices."

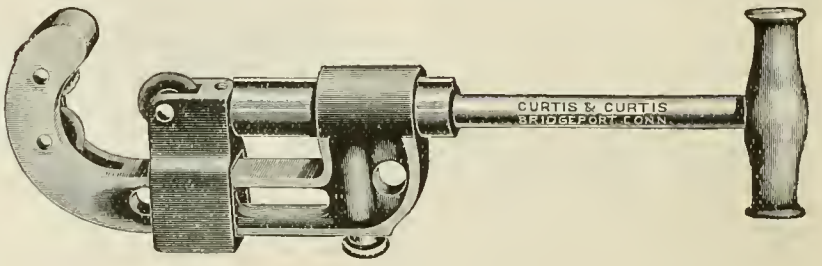
Morse Burtis, 52 John street, New York, manufacturer of valves, fittings, &c., has taken a suit of offices in the front of the building heretofore occupied by him, and on the same floor, giving much more commodious quarters.

A charter has been granted at the Pennsylvania State Department to the Sperl Heater Company of Carbondale, Pa.; capital, $20,000.

Robert Giffen, the eminent English statistician, has just issued a table comparing the trade of England, France, Germany and the United States in the period from 1890 to 1892. This table shows that the imports and exports have increased as follows: Imports—Germany and the United States, 33 per cent. each; England, 13 per cent., and France, 6 per cent. Exports—United States, 26 per cent.; France, 14 per cent.; England, 10 per cent., and Germany, 15 per cent.

Curtis Pipe Cutter.

Curtis & Curtis, Bridgeport, Conn., have placed on the market a new pipe cutter, a general view of which is shown in the accompanying illustration. A special feature of this tool is its simplicity, and several merits are claimed for this device by the manufacturers. The general principle is the same as in other three-wheel cutters, except that in this there is a very simple and quick adjustment which will save time to the operator. Instead of having the screw run through the body of the cutter it is run through a sleeve, which in turn slides in the body and is held by a spring pawl. Thus, in operating, the lengthy process of adjusting the cutters to the size of pipe to be cut is avoided by simply sliding the sleeve along until the wheel is against the pipe, when a few turns of the screw, while the cutter is revolved, cuts it off.



Curtis Pipe Cutter.

We learn from the Excelsior Steel Furnace Company, Chicago, Ill., that they have received advices from Washington that all their claims on their double seaming pipe machine have been allowed, and that patents will be issued on it.

The Philadelphia & Reading Railroad shops at Reading, Pa., have just turned out a monster steam whistle which, it is calculated, can be heard at a distance of 30 miles. The whistle is made of brass and is 3 feet long. It is intended for the power house at the Gordon Planes, Schuylkill County, Pa., its use being to obviate the necessity of the employees of the road traveling a long distance to ascertain whether the Planes will be put in operation at any time. The whistle will announce the hour for the men to report, the number of blasts indicating the hour.

One of the most lofty of the new down town "sky scraping" buildings in New York City is about to be put up at the corner of Nassau and Spruce streets, by the American Tract Society. The building will have 23 stories, and its total hight will reach about 300 feet. The cost is estimated at close on $1,000,000, and it is expected to be ready for occupancy by May 1, 1895. The hight of the new office buildings is only exceeded by the celerity with which they are run up.

TIN PLATES.

Condition of the Tin Plate Trade.

The tin plate trade is in a very singular condition. From the importers' standpoint it is exceedingly dull, with no immediate prospects of improvement. On the other hand, domestic manufacturers report an active demand for every pound they are able to produce, whether of bright or roofing plates. Both agree, however, in reporting prices stationary and with apparently no tendency to advance. Western jobbers are complaining of a restricted supply of roofing plates, which is giving them some inconvenience in meeting the demands of their customers. They are consequently applying to Eastern works that have heretofore done but little business in the West, to see whether shipments cannot be made more promptly. But they do not find much relief in that direction, as Eastern works are being driven as hard to meet the wants of their regular trade as the Western works. The situation is singular, inasmuch as importers are deriving so little benefit from an undoubted shortage in the supply.

The trouble is, of course, directly caused by the threatened tariff legislation, assisted to some extent by the depression in business of last fall and winter. Under ordinary circumstances, with no reduction in duty pending, contracts would have been made abroad in the fall months for tin plates to be delivered here during February, March and April, to meet the regular spring demand. But with a possibility of a heavy reduction in the duty, which last fall was expected to be made early this year, such orders for foreign plates were not placed. Merchants would not take the risk of a serious loss on the stocks they might have on hand in such an event. In the mean time, also, domestic tin plate factories had increased their facilities considerably, and merchants found that they could order small quantities as required by their trade, and avoid locking up capital in large stocks in their own warehouses. Even those who had been prejudiced against domestic tin plates were impelled by the business depression to turn to the domestic makers and take small lots in frequent shipments from the factories. Until very recently this worked well. The limited trade in progress was fairly supplied and there was no trouble. But now the consumption has greatly increased with the advance of the building season and the improvement in general business, and the domestic supply falls short of meeting the necessities of the trade. Imported stocks are not here to fall back on, but the danger of tariff reduction is more imminent now than it was six months since, so importers are more fearful than ever of incurring loss if they put themselves in shape to meet the rising demand.

Another feature has also developed which should receive consideration, as it is having an influence on the course of trade. The quality of American tin plates generally is so good that consumers prefer them, ask for them, and take imported plates with reluctance if they cannot get domestic. A short time since, before it was seen that there might be a shortage, a large Western jobbing house decided to handle only American plates, and its traveling men were instructed to run off the small stock of imported plates then on hand. They were told that the new stock would be American, and they surprised the house by the vigorous way in which they applied themselves to get rid of the foreign plates, because, as they said, their customers had for a long time so greatly preferred American plates that they had been handicapped in not being in a position to regularly offer them.

The domestic tin plate manufacturer is reaping the greatest benefit from the present situation among all concerned. Threatened with a severe cut in the duty which now protects his product, it might well be imagined that his natural condition would be one of suspense and indecision, planning meanwhile how to arrange his affairs so as to continue his business existence after the blow falls. But, curiously, he is probably kept too busy by the trade steadily coming his way to give very much thought to the future. He is making hay while the sun shines, and as the grass is growing very luxuriantly just now and the sun is shining on him very brightly, he can postpone indulgence in anxious care until the clouds are really overhead and the storm is beating down. Of all manufacturers the tin plate makers are probably the only ones who are actually deriving increased business by reason of the great delay in tariff legislation.

SCRAP.

We are officially advised that the report that the plant of the Ellwood Tin Plate Company, Ellwood City, Pa., had been closed down on account of lack of coal is untrue. The plant is still in operation, but, like nearly all other concerns, will probably close within a short time unless a settlement of the coal strike is obtained.

The American Tin Plate Machine & Mfg. Company, Linfield, Pa., have their plant in full operation, turning out 10 tons per day of finished plates. The concern have recently closed a contract for the sale of their entire output for some time to come. This firm are owners of the Buckman automatic continuous seaming and tinning machines.

An English exchange states that the plant for two additional tin mills has been shipped from Wales to be laid down at the Morewood & Co.'s tin plate works at Gas City, Ind.

The various tin plate works in Monmouthshire and Glamorganshire, owned by P. S. Phillips, the well-known Welsh tin plate manufacturer, are, it is announced, to be placed under the control of a limited liability company who have been registered with a capital of $1,000,000. The style of the company is P. S Phillips, Ltd., and it will acquire the well known Pontymister Steel and Tin Plate Works, near Newport, where the bitter strike raged for so long ; the Waterloo Tin Plate Works; the Abertillery Iron and Tin Plate Works; the Lion Tin Plate Works; Nantygle, &c. P. S. Phillips remains one of the directors of the new company, together with P. C. Phillips and F. A. Phillips.

The business of Hall & Carpenter, Philadelphia, carried on by the late J. Augustus R. Hall, has been purchased from the executors by Zachary T., Walter F., Harry B., and Willis E. Hall and Thomas B. Harper, who will continue the business at the old stand and under the old firm name of Hall & Carpenter. Their lines of tinsmiths' and stovemakers' supplies are well known to the trade. Their brands of roofing slates, including Hall's G. D. C., an old style plate, Killey, Seres and Argus, are also well known to consumers and are in active demand. Besides roofing plates they keep in stock some standard manufacturers' brands of bright plates, and are well able to satisfy the trade in this line. The members of the new firm are all good business men and competent to sustain the excellent reputation of the house.

Gummey, Spering & Co. of Philadelphia, the selling agents of the well-known Gilbertson's old method terne plates, will carry a much larger stock of these goods in future, their new quarters providing ample space for the purpose.

Black Diamond Tin Plate Works, Philadelphia, H. W. Scattergood, proprietor, are reported to be quite busy. Three trimming machines are in active operation, turning out both charcoal and coke bright tin plates and American roofing plates, for which a good demand has been met with. It is the intention of the proprietor to add more trimming pots as the exigencies of business demand. The brands of terne plates produced at the Black Diamond Works are Laurel, Arrow, Quaker City, Horse Shoe, and Black Diamond. The two last named are stamped, and the Black Diamond is referred to as an extra coated roofing plate of very superior quality. The bright plates produced bear the same brand names as the ternes. All are made of American rolled black sheets. The agents in New York City for the Black Diamond Works are Temple & Lockwood, 12 Platt street.

Geo. H. Ismon, sales agent for the Falcon Iron & Nail Company, Niles, Ohio, and the Salem Wire Nail Company, Salem, Ohio, has removed his office from Room 28, 277 Broadway, New York, to more commodious quarters in Room 32, on the second floor of the same building.

Sanderson & Peckham is the style of a new firm located at 76 Woodbridge street West, Detroit, Mich., who are rapidly coming to the front. They are styled manufacturers' agents, and sell to consumers and dealers a complete line of bright and terne plates, metals, tinners' and roofers' supplies, together with a few leading hardware specialties. Mr. Peckham is son of S. T. Peckham, late of the firm of J. S. & N. Peckham, Utica, N. Y. Mr. Sanderson was connected with the Black Hardware Company.

THE RETAIL STORE.

The Cream City Flour Bin and Sifter.

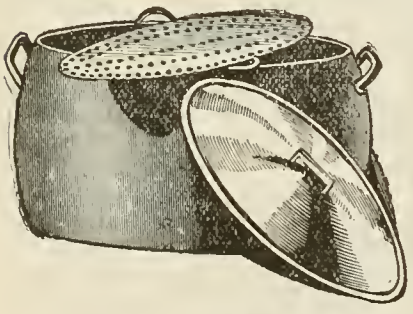
An illustration is herewith presented of the Cream City flour bin and sifter, made by the well-known manufacturers of tinware, the Geuder & Paeschke Mfg. Company of Milwaukee, Wis. The outer

The Cream City Flour Bin and Sifter.

wall of the bin is broken away in the cut, so as to afford a view of the working parts of thia admirable device for the convenience of the housewife. The manner in which it operates, as shown here, is so simple that no extended explanation is necessary.

Golden Crown Asparagus and Corn Cooker.

The cooker illustrated herewith is being offered by the Stuart & Peterson



Golden Crown Asparagus and Corn Cooker.

Company, Burlington, N. J. The cooker is an addition to their line of Golden Crown ware, and is provided with side handles. The strainer is removable and is designed for taking the vegetables from the pot. The point is made that the strainer is especially adapted to asparagus, as it keeps the bunches in order, which adds to their appearance on the table. It may also be used for meats and other purposes. The cooker is made in three sizes: Nos. 1, 2 and 3.

Squegee and Scrubber.

The Cleveland Novelty Company, Cleveland, Ohio, are offering the squegee and scrubber, of which illustrations

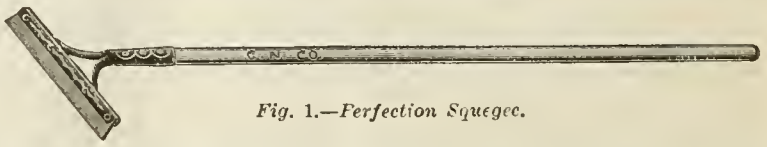


Fig. 1.—Perfection Squegee.

are here shown. The Perfection squegee, Fig. 1, has interchangeable parts, with malleable shank and decorated steel side stripa. It is remarked that

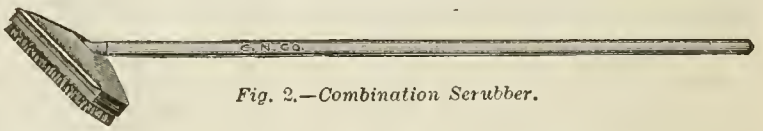

Fig. 2.—Combination Scrubber.

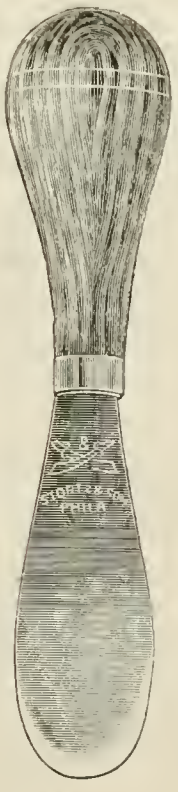
the rubbers are made of the best Para rubber, ¼ inch thick ; that when worn out new rubbers can be easily inserted, and that the device is thoroughly high grade. The Combination scrubber, Fig. 2, is a squegee and scrubber combined, composed, it is stated, of a Para rubber scraper, $\frac{3}{16}$ inch thick, and rice root brush of the best quality. It is adapted to the use of grocers, butchers and stores of all kinds.

The Philadelphia Ice Chisel.

The cut herewith represents an ice chisel being introduced by John Stortz



The Philadelphia Ice Chisel.

& Son, Philadelphia. The blade is 5⅓ inches long and 1⅛ inches wide at the broadest part. It is described as being forged from a superior quality of tool steel, carefully tempered and finished. The handle is of hardwood, nicely polished, and the tang of the blade is riveted through it. In shape the blade is similar to that of an iceman's axe, and is designed to crack ice in a straight direction without splintering. It is claimed that continued cutting in the same place will split the ice without splintering or chipping.

Central Draft Street Lamps.

The Rochester Lamp Company, 42 Park place, New York, well-known makers of the Rochester lamps and

Central Draft Street Lamps.

burners, have brought out a central draft street lamp, a general view of which is shown in the accompanying illustration. The advantages of the central draft lamp are being widely recognized, and its adaptation to street illumination will be of interest to the

trade. Special reference is made to the great amount of light the lamp gives. It is unaffected by wind storms, as the air entering the lamp passes through wire gauze and then down through the side tubes, one of which supplies the central draft through a gauze chamber and the other tube supplying the outside of the flame through another gauze chamber. The air currents are so modified by this means that the lamp has been successfully used on ferry boats. The globe is held up by a hook while trimming or lighting. The regular No. 3 or 9 street lamp globe is used with it, and is so annealed and protected from heat by the use of a chimney on the lamp inside that it is proof against storm, rain, snow, sleet or hail. It is adapted to burn all night or the time of burning can be regulated. It is made with either bail or post socket, and with 26-inch enamel reflector, if wanted for railroad or other uses. For general purposes of railroad stations, hotels and stable lamps, we understand it is meeting with a large demand.

HEATING and PLUMBING.

NEW WORK AND CONTRACTS.

THE KEWANEE BOILER COMPANY of Kewanee, Ill., and 96 Lake street, Chicago, are building a boiler plant for use on the Chicago drainage canal. The plant will consist of three boilers 60 inches by 16 feet, fronts, castings, trimmings, breeching and smoke stack. This company report business as improving.

CLARKSON, SCOTT & Co., Drexel Building, Fifth and Chestnut streets, Philadelphia, Pa., have the contract for a steam heating plant for the Lorain apartment house, at Broad and Fairmount avenue. George F. Huber & Bro., 738 North Thirteenth street, have the contract for the plumbing work.

THOMAS WEATHERED'S SONS, 244 Canal street, New York, will use one of their No. 6 hot water heaters for heating the residence of E. T. Bedford, at 121 Clinton avenue, Brooklyn, N. Y.

ALBERT CRYER & Co., 85 Centre street, New York, will install a heating plant in the new parochial school at Seventy-sixth street and Lexington avenue, using the largest size Richmond Sectional boiler and 3300 feet of Bundy Columbian radiation. They are installing a Victor hot water plant in the residence of J. Montgomery, Seventy-fourth street and Riverside drive. They have recently completed the installation of a Victor brick set steam heater in the Kill von Kull Club of Staten Island, N. Y.

RUBEL & Co, 75 and 77 Lake street, Chicago, are to install hot water heating plants in the residences of A. Florsheim and C. Cline, located on Vincennes avenue, near Forty-third street.

THE BUILDING COMMITTEE of the Board of Education of Saratoga Springs, N. Y., have been instructed to receive plans and bids for various systems of heating and ventilating an annex to their High School building.

THE BUILDING committee of the Odd Fellows' Temple recently held a special meeting at 110 State street, Albany, N. Y., to pass upon bids for plumbing and painting and to confirm other contracts. The plumbing work upon the building will be executed by Ridgway & Russ.

THE EXETER MACHINE WORKS, Boston, Mass., have received an order for Exeter radiators to be shipped to Copenhagen, Denmark. We underatand that the export business of this concern is rapidly increasing.

THE BOARD OF ALDERMEN of Buffalo, N. Y., have passed a resolution adopting the blower system of heating and ventilation for the new school house to be erected on Gurnsey street, for which plans are being prepared.

THE DUDLEY HOTEL, at Salamanca, N. Y., is to be rebuilt and enlarged, and among the improvements will be a steam heating plant and a plumbing system.

HART & CROUSE, 211 Water street, New York City, report, through their manager, W. M. Mackay, the following recent sales of Royal steam and water heaters: Wood Bros., Fishkill, N. Y.; F. Samuelson, Arlington, N. J.; Henry Dickson, Newark, N. J.; W. H. Clark, Lebanon, Pa.; Daniel McGurl, Pottsville, Pa., two heaters; German Methodist Parsonage, Dutch Kills, Long Island City, L. I.; Bogle & Scott, corner Hudson and North Moore streets, New York City; Virginia Plumbing & Heating Company, Roanoke, Va.; Dr. W. B. Johnson, Paterson, N. J.; A. L. Thrall, Jamestown, N. Y.; Paul Gantert, Palisade Park, N. J.; Geo. Devilin, Ravenswood, Long Island City, L. I.; Rudolph Guggenheimer, 101st street and Madison avenue, New York City, two heaters; J. Montgomery, West Seventy-fourth street, New York City. They report business on the increase.

LEE BROTHERS were awarded the contract for the plumbing in the fire engine house at Glens Falls, N. Y.

BIDS will be received by the Board of Education of Detroit, Mich., up to May 22 for heating and ventilating an addition to the Van Dyke School by means of hot air furnaces.

A. A. SANBORN has been awarded a contract for heating and ventilating the new High School building at Somerville, Mass.

THE UNION FURNACE COMPANY, 65 Dearborn avenue, Chicago, are to install a steam heating plant in the 24 flat building of T. E. Dorne & Co., Sixty-second street and I. C. R. R. tracks. Also in the residence of R. M. Wells, 3804 Michigan avenue.

THE CONTRACT for heating the north side of the Disston School, Thirty-fifth Section, at Philadelphia, has been awarded to Davis & Gorman Company for $1362.

THE SUPERVISING ARCHITECT of the Treasury Department has awarded Crook, Horner & Co. the contract for furnishing and erecting the plumbing apparatus for the Post Office building at Vicksburg, Miss.

PROPOSALS will be received by the Board of Education of Cleveland, Ohio, up to June 5, for a new school house which will require a system of heating and ventilation, will be lighted by gas and have a plumbing system.

SHEAHAN & GROARK, New Haven, Conn., the steam fitters and plumbers, are fitting up the house of Judge Samuel Bronson, on Dwight street.

THE CONTRACT for the heating apparatus for the new hospital at Easton, Pa., has been awarded to the H. B. Smith Company of Philadelphia, who will put in a hot water plant.

THE CONTRACT for the heating apparatus for the new gymnasium at Springfield, Mass., has been awarded to the Phillips Mfg. Company, whose bid was $956.

BABB, WITHAM & KELLEY, plumbers, Bangor, Maine, are doing a brisk business this spring. They have just put a very complete system of steam piping into St. Mary's Parochial School.

THE SMITH & ANTHONY STOVE COMPANY, 217 Lake street, Chicago, are to place their new Hub steel plate furnaces in six residences and two flat buildings at Ravenswood, and in four residences at Oak Park.

H. A. R DIETRICH, Bethlehem, Pa., has received the contract for placing a steam heating plant in the extensive addition to the residence of R. P. Linderman on Fountain Hill.

AT A RECENT MEETING of the School Board Building Committee of St. Louis, Mo., John Kelley, assistant superintendent of repairs, presented recommendations for appropriations of $8904.89 for repairs and $23,311 for putting steam heat in the school buildings instead of stoves and furnaces.

Southern Pig Iron Freights.—The Queen & Crescent Route has issued a new east bound pig iron tariff, effective May 15, giving rates on pig iron in carload lots from Southern furnaces to the following plants:

To	From Dayton and Rockwood, Tenn.	Chattanooga, Tenn.	Rising Fawn, Ga., and Fort Payne, Ala.	Birmingham district.

a Via Norfolk.
* In addition to above charges the cost is as follows: In lots of 50 tons and less, 60 cents per ton; over 50 tons, 50 cents per ton.
† The above rates cover pier delivery only. Additional charge within lighterage limits is as follows: In lots of 50 tons and less, 60 cents per ton; over 50 tons, 50 cents per ton.

A gushing oil well was struck on the 11th inst. in the new oil field near Neodesha, Kan. The well is 850 feet deep. For some time after the vein was tapped the oil was thrown above the top of a 74-foot derrick.

On her eastward voyage last week the swift Cunarder "Lucania" broke the record for a single day's run by covering 524 knots, on May 9.

Brooklyn gas companies have reduced their rates to $1 per 1000 feet.

ROOFING AND CORNICE.

John Galt & Sons.

John Galt & Sons, who have been at 52 John street, New York, for about 20 years, have established themselves in new and very desirable quarters in the Postal Telegraph Building, at Broadway and Murray street, rooms 805-806. This concern are said to be pioneers in the business of quarrying slate for roofing and other purposes and delivering it at a railroad station. This industry they commenced in 1861 and ever since their sales for domestic trade, we are told, have averaged 125,000 squares a year. From 1864 to 1875, inclusive, they claim to have supplied two-thirds of all the slates produced in this country. In 1876, owing to peculiar conditions abroad, they commenced exporting to Europe, largely to Great Britain, which is itself a large slate producing country, sending on an average 200,000 squares each year until 1879-80, when the bulk of the trade in that market lapsed. Up to 1893 they have done quite a large business with Australia, and more or less to date with the West Indies and South American countries. Slates in America are sold by squares, a square being equivalent to a space 10 feet square or 100 square feet. In England they are sold by the thousand pieces, but the buyer really gets 1200, while Welsh slates are furnished on the same basis with 5 per cent. in quantity added for breakage, or 1260 for 1000. The latter custom evidently has grown from the fact that slates quarried in Wales are thinner, with a consequent larger loss in handling.

Friedley & Voshart,

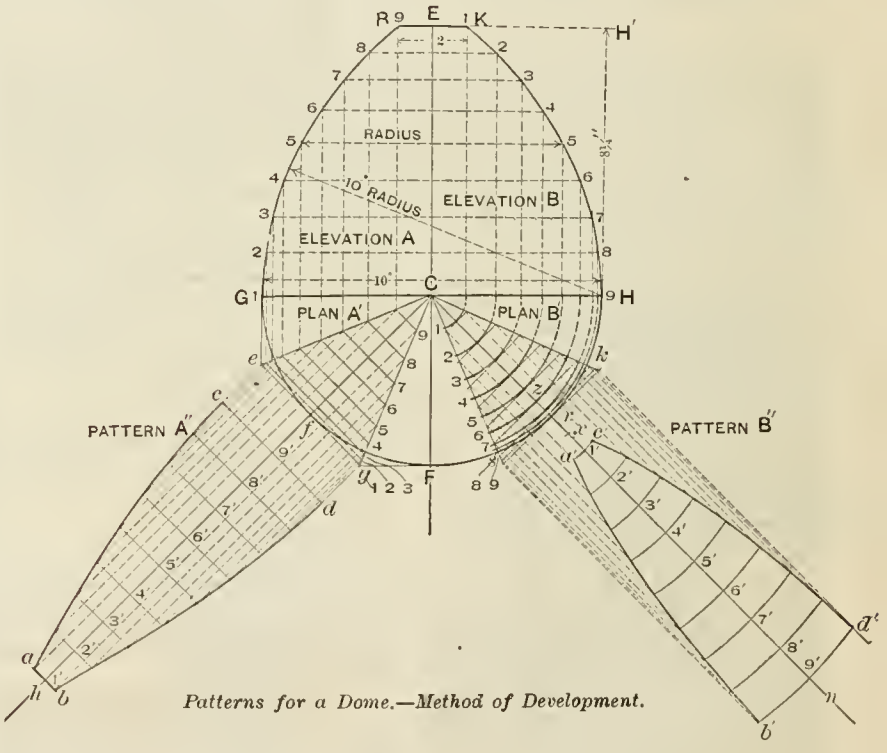
194 and 196 Mather street, Chicago, have just issued a new catalogue of architectural sheet metal ornaments, statuary, &c. This catalogue is their fifth annual, and is said to be the largest in its line which has thus far been published in this country. It comprises 136 broad pages replete with illustrations and price-lists. Many of the designs shown are entirely new, and are exclusively brought out by this firm. The first half dozen pages are used for the display of designs for statuary. These are made from models by some of the best artists and sculptors in the country. Next follow mediæval and modern forms of gargoyles and eaves trimmings, heads of animals, human heads and medallions, followed by festoons, garlands and wreaths in very great variety, rock faces in numerous patterns, panels, scrolls and square, oblong and circular rosettes, ceiling center pieces, finials or pinnacle tops, twisted tops, column trimmings and urns, shells, friezes, moldings and ornamental designs for enriching all kinds of finishing work, creatings, dormer window embellishments, gable ornaments, panel ornaments, capitals, leaves, mansard roofs, ceilings, points, crockets and volutes, conductor heads, spun balusters, merchants' emblematical signs, &c. The firm greatly enlarged their factory the past year so as to be able to meet orders for special or stock goods with the least possible delay.

Patterns for a Dome.

From J. C. A., *Green Bay, Wis.*—I would like to see a method, or methods, published in *The Metal Worker* by which I can obtain the patterns for a dome shaped article of eight pieces, and either octagon or round in plan. As shown in the accompanying sketch, the base of article G H is 10 inches, and the top R K 2 inches in diameter. The vertical hight H′ H is 8¼ inches. The profiles G R and K H have a radius of 10 inches, and are struck from points G and H as centers.

Answer.—In the accompanying diagram let G R K H be the elevation of dome, to be constructed of eight pieces, as indicated in plan by G *e g s k* H. In elevation A and plan A′ the pattern is obtained for an article having eight flat sides and octagon in plan, while in elevation B and plan B′ the pattern is obtained for an article of eight pieces, but round in plan, the pieces to be formed to the required shape by raising. To obtain the pattern A″ from elevation A and plan A′ proceed as follows: Draw the elevation in such a manner that one of the sides, as G R, will be shown in profile; also draw the corresponding plan in line, as shown by G *e g* F. Divide the profile G R into any convenient number of equal parts, as indicated by the small figures, and from the points thus obtained drop lines parallel with the center line E F, cutting the miter line C *e*, as shown by the dotted lines. From the points thus obtained in C *e* carry lines parallel with *e g* of plan, cutting C *g*. On C *f* extended, as *f h*, lay off a stretchout of R G, as shown by *f h*, through the points in which draw the usual measuring lines. Place the T-square parallel to the stretchout *f h*, and bringing it against the several points in the miter lines C *e* and C *g*, cut the corresponding measuring lines drawn through the stretchout line *f h*. Lines traced through the points thus obtained, as indicated by *a c d b*, will form the desired pattern.

Using the elevation B and the plan B′, the pattern B″ is obtained as follows: From the points obtained in G R carry lines parallel with G H, cutting K H, and from the points thus obtained drop lines parallel with E C, cutting C H, as shown. With C as center, and the points in C H as radii, strike arcs cutting C *k* and C *s*. From the points of intersection in C *r* erect perpendiculars cutting C *s* and C *k*. On C *r* extended, as *r n*, lay off a stretchout of K H, as shown. With radii equal to distance across elevations A and B, as indicated by the dotted lines drawn from points in G R to K H, strike arcs through the points in stretchout line *r n*. Thus the arc *b′ d′* of pattern is struck with G H as radius, from point *x* as center. Arc *a′ c′* of pattern is struck with R K as radius, from point *z* as center. Place the T-square parallel with the stretchout line *r n*, and, bring-



Patterns for a Dome.—Method of Development.

ing it successively against the points of intersection of the perpendiculars with miter lines C *s* and C *k*, cut corresponding measuring lines drawn through the stretchout line *r k*. Lines traced through these points of intersection, as shown by *a' c' d' b'*, will form the required pattern.

FLASHINGS.

ÆTNA STANDARD IRON & STEEL COMPANY, Bridgeport, Ohio, issue a very neat roofing catalogue. The volume, of the usual dimensions, is bound in dark colored paper with gilt title, and contains much information that is of interest to the roofing trade. The company make black, painted and galvanized roofing sheets, plain, corrugated and in other forms; also common, cold rolled, pickled and plain finished sheets and plates and common and patent leveled sheets. The catalogue opens with a view of the extensive works of the firm at Bridgeport. Following a prefatory note are tables of weights. The illustrated portion of the catalogue relates to corrugated sheets, crimped iron roofing and siding, beaded siding and ceiling, weather boarding, siding, &c. At the close of the pamphlet are a number of blank pages for memoranda. We learn from the Ætna-Standard Company that trade is at present active under the stimulus of short supplies, brought about by the curtailed production resulting from the coal and coke strike. The firm have part of their works in operation on natural gas, but a portion is closed down on account of a lack of fuel. They have, however, abundant stocks of galvanized iron and black sheets, also corrugated, from which they will be able to meet all ordinary demands from customers during the present season.

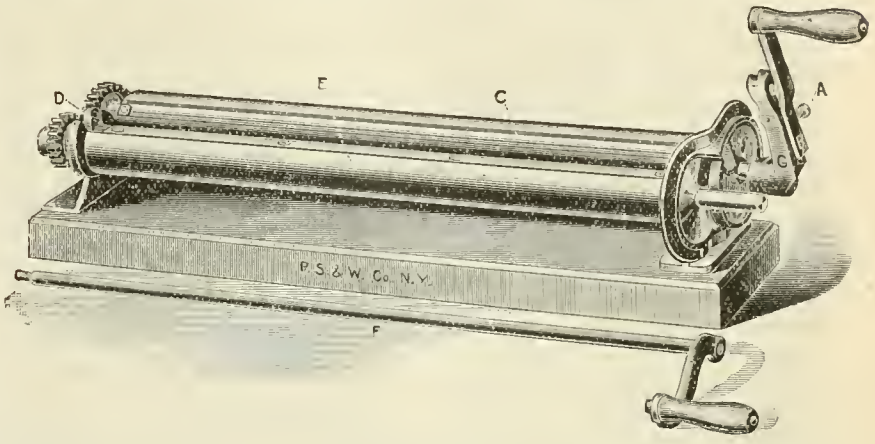
THE SALTSBURG ROLLING MILL COMPANY have been organized and are now at work on the erection of a plant at Saltsburg, Pa., on the line of the Baltimore & Ohio Railroad, some 8 miles from Pittsburgh, for the manufacture of fine sheet iron, sheet steel and rustless roofing sheets. The plant consists of three sheet mills and one sheet bar mill. The engine, bar mill and two of the sheet mills are being built by the Robinson-Rea Mfg. Company of Pittsburgh, builders of rolling mill machinery. The boilers are being furnished by the Carroll-Porter Boiler & Tank Company of Pittsburgh. The buildings will consist of a main building, 80 feet wide by 240 feet long, with shedding 30 feet wide and the same length, and boiler house, 32 x 60 feet. The buildings are of frame, with iron roof, and are about completed. The firm expect to be in the market with the above lines of manufacture about October next. The officials of the concern are S. A. Gourley, president; W. F. Stitt, treasurer, and Gill Sitt, secretary.

KNORR & BLOCKS 165 Wells street, Chicago, have contracts for furnishing the galvanized iron cornices, gutters, slate roofs, &c., for the store and flat buildings of C. J. Langan and Euhl & Smith, Lincoln and Southport avenues. Also for the residence of H. Zimmermann, Berdo and Perry avenues, Ravenswood.

ROBERT HOWARTH'S SONS of Chester, Pa., are putting a slag roof on the Chester Lumber & Coal Company's new shed at Chester. The area of the roof is 40,000 square feet, and over 100 tons of material will be used.

Eaves Trough and Conductor Pipe Former.

The Peck, Stow & Wilcox Company, Southington, Conn., and New York, are bringing out a novel and ingenious machine, as shown in Figs. 1 and 2, for forming both eaves trough gutter and conductor pipe. It is intended to take the place of the following regular machines heretofore used for this purpose —viz.: Gutter former, gutter beader, pipe former and folder. As shown in Fig. 1, the machine is arranged for turning a lock on and forming conductor pipe. Such pipe can be formed on this machine of any diameter from 2 to 4 inches, and when run through the machine in accordance with minute directions given with each the pipe is formed and a fold turned on the edge ready for grooving. Fig. 2 illustrates the machine as arranged for beading and forming eaves gutters. The machine described is 30 inches long, but can be made of any desired length within reasonable limits. The eaves gutters can be formed of any size, but the bead on the edge is made of only one size. This size, however, can be made to suit the requirements of the purchaser.



Eaves Trough and Conductor Pipe Former.—Fig. 1.—Arranged for Turning a Lock on and Forming Conductor Pipe.

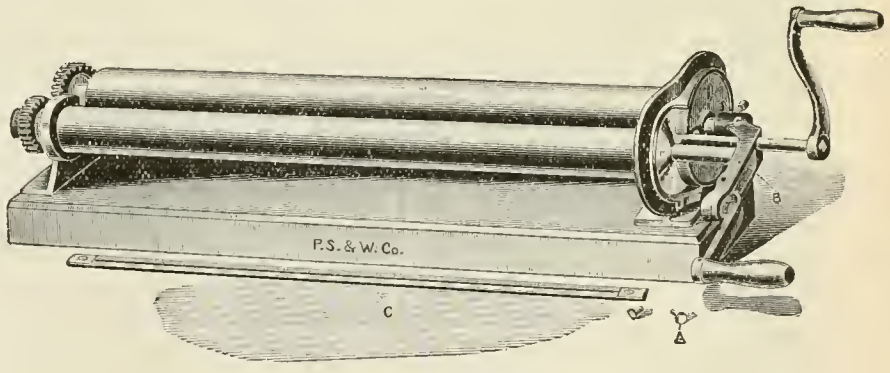


Fig. 2.—As Used for Beading and Forming Eaves Gutters.

Coin in the slot gas meters are to be tried in San Francisco. An English gas journal states that 75 of such meters have been shipped to that city from Glasgow, Scotland. They are adjusted to deliver 125 feet of gas for every 25-cent piece dropped in the slot.

Copperamiths in England have adopted a line of work that is meeting with great success. They are reproducing all the old fashioned shapes in jugs and vases in burnished copper. The old leather bottle shapes look very inviting in metal, and can be copied with surprising accuracy.

The insatiate maw of the Standard Oil Trust has just made another gobble. Under its Western name of the Continental Oil Company, it has absorbed the Vacuum Oil Company of Denver, Col., who control the sale of two-thirds of the lubricating oil consumed in the West.

A decision of importance was handed down last week by Justice Brewer of the United States Supreme Court, denying the right of certain Southern and Western States to levy the interstate commerce tax imposed on commercial travelers. A Chicago salesman recently visited Titusville, Pa., and, not having taken out a license, was fined $25. The judgment was affirmed, on appeal, by the Supreme Court of Pennsylvania. Justice Brewer in reversing this judgment said: "No State can levy a tax on interstate commerce in any form, whether by way of duties laid on the transportation of the subjects of that commerce or on the receipts derived from that transportation, or on the occupation or business of carrying it on." This decision will set at rest a long disputed question, and will be hailed with approval by the traveling fraternity.

Railroads in the West and Southwest are beginning to report increased earnings. This is regarded as a promising sign of recovery in those sections of the country where the late depression was most pronounced.

STOVE TRADE NOTES.

The New England Stove Trade.

The condition of things in this territory has not undergone much change since last reported. There is possibly a slight improvement in the demand for ranges, but it is scarcely enough to be worth noting. Notwithstanding this, the trade seems to be in a cheerful frame of mind; manufacturers having reduced production to fit the demand, and dealers having placed their orders with reference to the depressed state of things. Many more stoves might be sold if the dealers were willing to extend credit, but with the aversge workingman on short time and reduced pay, owing his grocer and butcher and not gaining any on his indebtedness, dealers generally are refusing to sell to this class except for spot cash. Orders for single stoves are numerous, and generally accompanied by the request that shipment be made at once, as the stove is already sold. Manufacturers in this vicinity are for the most part running on full time, particularly those in the Taunton district. Stocks of both jobbers and retailers are very low, and any revival in business will be felt almost immediately by the manufacturers, and some of them are discounting this by making up considerable stock. Medium and high price goods seem to be the best sellers at present, possibly the latter taking the lead. Collections are satisfactory.

An interesting feature of the New England stove trade is the business of two foundries, one in Massachusetts and the other in Maine, which sell their product entirely through peddlers. This system has been in vogue for some years and is carried on successfully. Carloads of stoves are shipped to various points and there met by two men with a team upon which is loaded as large a variety as the wagon will carry and then taken about the country from house to house and sold to the poorer class of farmers and laborers living in out of the way places, although occasionally these people invade the larger towns and temporarily create consternation among the regular dealers. The Yankee genius for bargaining finds great scope in this line, old stoves being frequently taken in trade and sometimes articles of farm produce, although for the most part the goods are sold outright and a long time note without interest accepted in payment. It is a common thing for these notes to run one year.

The furnace trade is halting. Local dealers have a good many estimates out, but as the building season is not fairly open few contracts have been awarded, consequently a hand to mouth business is being done in this line at present, but the prospects for the summer season are fairly encouraging. Gasoline stoves appear to be booming, and the sale of gas stoves is on the increase owing, it is thought, to the prevalence of $1 gas. Refrigerators are moving rather slowly, but some duplicate orders have already made their appearance.

Cupola Management.*—XII.

BY DR. EDWARD KIRK.

Relining and Repairing.

When a cupola is newly lined the lining is generally made of the same thickness from the bottom to the top except when the cupola is boshed. The casing is then either contracted to form the bosh or it is formed by putting in two or more courses of brick at this point. The lining varies in thickness from 4½ to 12 inches, according to the size of the cupola, the heavier linings always being put in large cupolas. The greatest wear on the lining is at the melting zone, where it burns away very rapidly. From this point up it burns away more gradually and evenly, but the greatest wear is toward the bottom, where the heat is the greatest, and so a cupola gradually assumes a funnel shape with the largest end down and terminating at the melting zone, and the lining is always thinnest at about this point when it has been in use for some time.

At and below the tuyeres the destruction of the lining by heat is very slight, and the principal wear is from chipping and jarring in making up the cupola. At the charging door the principal wear is from the stock striking the lining in charging. In the stack the lining becomes coated with sulphides and oxides and is but little affected by the heat. A stack lined with good material properly put in generally lasts the lifetime of the cupola. The length of time a cupola lining will last depends upon the amount of iron melted and the way in which it is taken care of, and varies from six months to three or four years when the cupola is in constant use.

A lining burns away very rapidly at the melting zone, and if not repaired every heat would burn out to the casing in a few heats. Above the melting zone it burns away more slowly and evenly, and gets thinnest just above the melting point. From this point it gradually grows thicker up toward the charging door, where the wear is comparatively slight. The thickness of lining required to protect the casing where the heat is most intense depends upon the quality of the fire brick and how the lining is put in. A lining of good circular brick made to fit the casing, and laid up with a good, well mixed grout, remains perfectly solid in the cupola as long as it lasts, and may be burned down to 1½ inches in thickness, and even less, for several feet above the melting point. When the brick do not fit the casing and large cracks or holes have to be filled in with grout, and daubing or the lining is poorly laid up, it becomes shaky as it burns out and in danger of falling out, and it cannot be burned down so thin as when solid.

It is therefore cheaper in the long run to get brick to fit the casing and have the lining well put in. It will then only be necessary to reline when the lining gets very thin almost up to the charging door. The lining at the melting zone, where it burns away the fastest, is often taken out for 2 or 3 feet above the tuyeres and replaced with a new one when it is not necessary to reline all the way up. In repairing a lining in this way the same size brick are generally used as were used in lining. The lining has been burned or worn away above and below the point repaired and the new lining reduces the diameter of the cupola to the smallest at the very part where it should be the largest. The result is that the new lining is cut away faster than any other part, and after a few heats it is as bad as it was before the new section was put in.

A better way of repairing a lining at the melting zone is to put in a false lining over the old lining. This is done by putting on a layer of rather thin plastic daubing over the old lining and pressing a split fire brick into the daubing with the flat side against the lining. The brick are pressed into the daubing close together almost as soon as it is put on and all the joints are filled up and the surface made smooth. A lining may be put in a cupola in this manner all the way around and to any hight desired, or only thin places may be repaired, which is done without forming humps in the lining that interfere with the melting.

A split brick is an ordinary fire brick, only 1 inch thick in place of 2 inches, and is now made by all the leading fire brick manufacturers. I believe I was the first to repair a lining in this way, some 20 years ago. The split brick could not then be procured from the fire brick manufacturers, and they were made by splitting the regular sized brick with a sharp chisel after carefully nicking them all around. When the regular split brick cannot be procured they may be made in this way. Most of the new brick split very readily and true, but bats from old lining generally spall off and are difficult to split. A lining of split brick can be put in almost as rapidly as the cupola can be shaped with daubing alone. The diameter of the cupola is not reduced to the same extent as with a section of new lining put in in the regular way, and the best melting shape for the cupola is maintained with only a reduction in the diameter of from 3 to 4 inches. This lining, when put in with a good daubing well mixed, lasts as long as an equal thickness of lining put in in the regular way; and it can be put in at a great deal less expense for labor and material. It is, however, worthless if put in with a poor, non adhesive and unrefractory daubing.

*Copyrighted, 1894, by Edward Kirk

The bats from old linings make an excellent daubing or grouting material when ground fine and mixed with a little clay, but few foundries have a sufficent quantity to pay for constructing a mill to grind them in, and the only other use that can be made of them in the cupola is to split the best into spalls for pressing into a thick daubing when repairing a lining.

[THE END]

Cleaning Castings.*

BY A. C. MOTT.

Before beginning this subject I wish to say that there is no probability of my saying anything new, or anything that is not already known to most, if not all, of you; and that if this article causes any discussion that will bring out the best and cheapest method of cleaning castings, its object, I take it, will be accomplished.

Into this subject, like all others pertaining to cleanliness, personality enters to the greatest extent. Some persons are noticeably clean; others the reverse. Some persons have everything clean about them; others the reverse; and with the cleaning of castings as much depends upon the personal disposition as in any other point in our business.

There are foundries in existence which have nothing but the old fashioned scratch brush, and yet turn out better cleaned castings than those having the most modern machinery. Your castings can be made as clean as you demand they shall be, just as your castings are made of such a standard as you demand and your inspector enforces. The inspector is, after all, the one person who controls, and it is upon his judgment that you must depend as to whether your castings are properly cleaned or otherwise.

I might say that the first point, or place, in which you start to clean castings is on the molder's floor; if you use such care in the selection of iron, sand and facing that the sand will not burn to the casting, but will scale easily from it, in fact so that a goodly portion of the sand is rapped off by the molder, you have accomplished just so much in the cleaning.

Early Methods of Cleaning Castings.

The old fashioned method was to use a wire scratch brush, made of No. 16 to No. 28 wire done up in a mass, with which a man brushed the sand from the casting.

Then mills came into use, which were made hexagonal or round form, either of iron or wood, and each mill driven by its own belt from shafting suitably placed. The castings were packed immovably in these mills with small shot iron placed between them, and the movement of these shot when the mill was revolved rubbed the sand from the casting.

Since then they have experimented with square mills and some claim for them great advantage, as they are much easier packed, and more work and larger castings can be placed in them, and with much less liability of breakage and with generally better results in cleaning.

Of late years, however, they have introduced great improvements in this respect, in the form of sheet steel mills running on hollow spindles. The outer cases of these mills are perforated, not to allow sand to escape, but to allow air to enter, which is drawn in by a suction fan so placed as to suck the air through the openings in the outer shell, which carries the dust and sand through the spindle, and forces it through proper tubing and deposits it at any given point desired.

In these mills they use small star shot made of exceedingly hard iron, which are known by the name of "steel shot." These have five or more points with sharp edges, which enter into all deep carving and interstices, when the mill is not too closely packed, and the dust is drawn away by the fan, and the castings come out exceedingly clean, and if run for any length of time the rubbing of the shot brings the graphitic carbon in the iron to the surface, thereby making a very high polish which, when touched with the hand comes off with all the effect of black lead.

These mills are so made that they can be run in couples back to back from one shafting, and are started or stopped by a friction clutch, and in some cases they are so arranged that as high as four couples or eight mills are run in the same form. The only drawback I have ever heard in regard to these mills is the trouble experienced by the sand getting into and cutting the bearings of the machinery, thus causing considerable expense for repairs.

Churns.

There is also a class of mills known as churns which do most excellent work. They are cheap, and, in the writer's opinion, exceedingly profitable. These mills should be placed over a pit or cellar, walled in so as to retain the dust and dirt. Preferably these should be made large enough to contain a week's supply of sand, with openings at bottom for the purpose of removing the same. A driving shaft is made long enough to carry ten or less of these churns On these are placed flanged wheels about 8 inches in diameter, made with chilled face. A loose shafting extends over the length of one mill, which is made, say, 30 inches long and from 10 to 24 inches in diameter, and bearing wheels placed to match those of the driving shaft, the top of both sets of wheels running level with the floor. The mill is made so that the heads of the mill rest upon the wheels and is driven by friction. The mill is rolled off these bearings on to the floor, opened and packed. When I say packed, I mean the castings are put in loosely. The shot used are star shot, and are never removed. The mill is closed up, rolled on to the friction rolls, started and allowed to run for one, two or three hours, or such time as is necessary to clean the work. The expense of running is very small, consisting principally of the lining up of the shaft once a year, while the mill itself will wear from two to five years, and the repair work outside of the shafting cuts a very small figure.

These are largely in use in our part of the country in malleable iron shops, hardware shops, &c., and are considered very desirable.

The Acid Bath.

There has also recently been invented an acid, the castings being placed just as they come from the molder's floor in a bath of the same The acid attacks the sand rather than the iron, and it is claimed simply scales the castings without eating into the iron. For some characters of castings this would be highly desirable.

I do not think it is necessary in this article to describe or consider the sand blast methods of cleaning, as they have been tried and found wanting, and I do not know of any one who has tried this system who has it in use at the present time.

This covers what is generally known as the cleaning of castings, and I believe covers all I was requested to speak of in this respect, but I consider that the cleaning of castings extends much further than the mere brushing off of the foundry sand which adheres to it, as under the head of the cleaning of castings comes the counting and inspection of the work.

Counting and Inspection of Work.

There are some shops who count the work in the gangway in front of the molder's floor, and who discount from the cleaning room after inspection. This method has its advocates.

Another method is to count the work after it is cleaned—that is to say, the work is carefully sorted, all the plates belonging to each stove being placed in separate piles, and an inspector or ware boss counts the parts and the molder receives credit from this count.

Still another way is not to count the work at all; simply clean it and put it on the work room shelves. When the stove is mounted, the molders making this stove are credited with the number of parts of their work required to mount the stove. To illustrate: The No. 8 Starlight cook stove is in the sand. It is divided among four molders, who make parts for a number of stoves. Molder A's parts amount to $0.96 for one part, molder B's $0.87, molder C's $0.91, molder D's $0.90. When the mounter takes the work from the shelves to mount say eight stoves, molder A is credited for 8 × $0.96, $7.68; molder B is credited for 8 × $0.87, $6.96; molder C, 8 × $0.91, $7.28; molder D, 8 × $0 90, $7.20. This seems to be a perfectly fair method, as it requires the molders to make their work even, as no work is counted unless it is even. Where odd work is required under this system, it is taken from the shelves, notification being given the foreman, who sees that the extra parts necessary to even it up are made, the molder being paid for such extra parts.

While this plan works very advantageously to the manufacturer and also to the molder, yet the feeling exists that he is not getting paid for what he does, especially when the end of the week comes and he has parts left on the shelf, owing to his partners on the job not having their parts even with him. Yet the experience of those who use this system shows that molders receive as good wages by this system as by any other; the disadvantages, if any, being to the manufacturer, caused by forcing work through to keep the stoves even.

The cleaning of castings cuts a very large figure in the general results of the manufacture. I would state that I have known parties making first-class stoves, as far as molding, mounting and trimmings were concerned, but they were careless in their cleaning, and I have heard dealers say: "Why, their stoves are of no account; they do not even brush the sand off their castings."

Castings for Nickel Plating.

After the castings have been cleaned in any of the manners aforesaid, there are many of them that require to be nickel plated. These are placed in mills of the exhaust character, and remilled with sharp, new star shot, and thus made absolutely and positively clean and ready for the polisher. This method, which, I think, is generally used, is probably the cheapest method possible. This would cover the cleaning of them for japanning as well.

There is also a water mill very largely in use, which is used to polish small castings, such as turn keys, shakers, lifters, &c. The mills are made either of the cylindrical form, with a man or hand hole through which to place the castings, and which is closed with gum gaskets in the same way as the man or hand hole of a steam boiler. Being water tight, water is placed in them before closing, together with sandstone spalls or small pieces of granite.

Others make these mills in an egg shape in two pieces united at the center, where they are not tight, and run them in a tub of water, the water entering the crevices in the center; and the castings being, by the shape of the mill, thrown outwardly and then inwardly, receive their polish in this way.

Both of these forms of mill are doing good work. The castings, to fit them for nickeling, should be allowed to remain in the mills and kept moving from two to six days, according to the character of the work.

Castings which require to be nickel plated also require buffing, and as grease is used on the buffing wheels it often deposits on the background of the castings, requiring them to be cleaned. Soft soap and hot water is probably the best method for cleaning these. We have tried many cleaning compounds, articles which are much more expensive, but find the above is preferable.

In conclusion, I would state that a sufficient quantity of mills—that is, enough so that the work can be kept in them long enough to become properly cleaned—is highly advisable, and it is of the utmost importance that work should not be removed until it is absolutely clean, thus saving the expense attending upon the handling and rehandling of the work, which would otherwise be necessary.

MORAL: Put up more mills than you want and good ones.

* Read at the convention of the National Association of Stove Manufacturers, held in Chicago May 2 and 3.

THE GEM CITY STOVE MFG. COMPANY of Quincy, Ill., are the assignees of a patent recently granted to F. Kaempen, Jr., and covering a device for operating oven shelves. The invention relates to stoves having oven shelves or pan supports which are moved in and out by means of a connection with the oven door. The object of the present device is to secure a simple, convenient, durable and economical means for moving the shelves or pan supports outward in a straight line as the oven door is opened and without danger of any binding of the parts. It is also intended to provide a means whereby the device when disconnected from the door, and the shelf withdrawn or slid outward, may be automatically set or shifted into correct position to connect with the door by the inward sliding movement of the shelf.

The Education and Production of Finished Workmen.*

BY H. D. KELLER.

Before entering on this subject let us consider of what the qualifications of an efficient workman consist.

A person, in order to be efficient at anything, must possess a practical knowledge of all details in connection therewith. While one possessed of such knowledge may be a capable workman, there are a number of things that may cause him to be undesirable. He may be quarrelsome or continually causing trouble, or may on account of carelessness be the cause of great loss to his employer, or he may be the possessor of that unquenchable thirst of which so many unfortunately are the victims. It is therefore plainly to be seen that the standard of desirability cannot be based on efficiency alone.

Now let us see whether or not our workmen are efficient. A look over the patterns of the range or heater that has been in the sand but a few months, or a glance over our broken and discounted castings, brings us to the natural conclusion that their standard of efficiency is low. As it is an undisputed fact that the standard of ability among workmen of the past was far superior to that of workmen of the present day, we naturally look for the cause of this depreciation of ability.

The "Whole Stove" Plan.

Some years ago molders worked on what is kuown as the "whole stove" plan; that is, one molder made a whole stove each day, or else two or more worked in conjunction, aud in either case were only paid for complete stoves. Under such conditions the loss of a casting was something to be avoided; the natural tendency would cause a molder to be cautious. A poor workman under this system could not hold a job, much less work with a gang that had a set of patterns split up between them, and in consequence there was a scarcity of poor molders; there was also another advantage in this system, and that was a desire on the part of one molder or gang of molders to turn out superior work to that made by others, as the stoves on a whole would show up for or against them.

The larger foundries in later years discontinued the system because there was such a demand for certain stoves that molders in many cases would work on one pattern the greater part of the year. The natural result was a lot of bottom molders, top molders, oven door molders, flue strip molders, &c. Under this system the loss of a casting on the part of the molder was only its piece price value, and consequently the ability of the molder as a general workman fast depreciated. He naturally became more skilled in making the piece he was working on, and as a result did a larger day's work than he had formerly done under the whole stove system. This fact could not escape the ever watchful eye of their employers for any great length of time, and the result was a reduction of wages Now it is a fact where there is once a price made on a piece of work the workman either concludes that he is getting what it is worth to make, or that he is getting less—never more; when this price is reduced he concludes that he is getting less than the piece is worth, and in consequence puts less labor on it, which must result in inferior work. This has been the experience of foundrymen after strikes caused on account of a reduction in wages, and it has always taken a long time to again get the quality of work to the same point of excellence that it had before the reduction took place. And in many cases the same results have not been obtained even after a lapse of years. With workmen produced under the straight job system, is it to be wondered at that they cannot do what was accomplished in former years when the change that has taken place in the stove business in the last few years is taken into consideration? Competition has forced manufacturers to make such a large and ever changing variety of stoves that even the skilled molders of the past would find it difficult to come up to their former point of excellence. Patterns are not given the finish they received in former years, as the expense of doing so would soon eat up what little margin there is yet. This also helps to keep down the quality of work produced. Where stoves can be kept in the sand the year around there is very little cause for complaint on account of inefficient workmen, but as the demands of the trade are such that this cannot be done we need go no further looking for a remedy with our molders. We must look for a remedy in the production of molders of a superior class, and to do this we must start at the foundation—namely, the educating of our apprentices.

Educating the Apprentice.

Men and boys can be classified as follows: The know-nothing class, among which we find those that, although they may be young in years, have long ago outgrown their period of learning. They know it all. No matter how much thought and study you may have given the subject, they will surely try to convince you that they know more about it than you do. There is another class who are ever on the lookout for more information and knowledge. They find others engaged at the same occupation who, in their estimation, are superior workmen to themselves. It is this last class that possess the qualifications desirable in an efficient workman; and it is of this last named class only that we can produce capable workmen.

The first and most important step is to select only those that have the necessary qualificatious to make them desirable. An active temperament, a desire to learn and a good, strong constitution are things that are most essential. There are, of course, numerous other features that are desirable; but we are not looking for angels among boys desiring to learn a trade. We will make mistakes at times in selecting boys, and when we find such to be the case it is well to drop them at once. Two weeks ought to determine, in most cases, whether or not a boy is desirable.

The Instructor.

Having selected desirable apprentices, our next step is to make thorough workmen of them, or rather lay a foundation with that object in view. To accomplish this we require a competent instructor, who, in addition to being a first-class workman, should also possess the faculty of knowing how to get the best results out of those he may have in charge; he must know how to study their various dispositions; he should know when a few words of praise can be bestowed to good advantage; he should know that the secret of success in teaching lies principally in knowing how to work on the learner's ambition, and as it is a well-known fact that "ambition likes praise, not flattery," it becomes evident that it must dislike the negative thereof, which is fault finding.

No matter how ambitious and willing the learner may be, or how good at learning, he will make mistakes, and in such cases it requires good tact on the part of the instructor to do the correcting in such a way that the ambition of the learner will not be cooled; it can be done in a very nice way by pointing out the excellent work done by some one else, and the natural result will be a desire to excel.

Instructors must not expect the learner to know as much in a few months as it took them years to acquire. Beginners must never be crowded, but instead must be taught how to make every move count. They must have a reason given them why work should be done in a certain way—in fact, a reason for everything. If this is not done they are liable to find some other way of doing it.

No mold should be closed that is not perfect. Don't ever let a boy understand that anything short of perfect work is good enough. No good results can be obtained any other way.

Teaching a system is of the utmost importance. System means the most work obtainable with the smallest amount of labor, and it further means neatness, a place for everything and everything in its place.

Object of Learning a Trade.

It must be remembered that there is but one object in learning a trade, and that is to earn money, and that all those learning have that object in view. It must, therefore, be demonstrated that the journeymen in the shop earning the most money are those who have the least loss and do the best work, and that there is only one way to accomplish this, and that is in learning the best way to make everything.

Where it could be done a great help would be an evening class for boys, where everything in connection with the production of stoves could be taught, as well as mechanical drawing, geometry and algebra; these last named branches tend to strengthen the reasoning faculties. Practical demonstrations in the shape of lectures would also be of great benefit. The thorough education of apprentices in the art of molding cannot be too strongly insisted upon. It is nearer an art than it is a trade, and the apprentices we turn out will ever carry our trade-mark in the shape of their abilities; and it is a certain fact that the class of work made in any shop can be judged by the class of molders turned out. Apprentices left to shift for themselves, as a rule, will only excel in one thing—that is, their ability to keep up a good supply of scrap.

In a small shop the foreman finds time to instruct, and in larger ones, where from 10 to 30 apprentices are employed, it pays to have a good instructor. We may see the money paid an instructor on the pay roll and feel that we may pay it out without getting adequate returns, but it is a wrong conclusion, as the labors of that instructor will show in the increase of the earnings of our apprentices, as well as in the quality of their work.

As a whole, a good instructor with capable apprentices and constant oversight and assistance by the employer will certainly produce efficient workmen.

* Read at the convention of the National Association of Stove Manufacturers, held in Chicago May 2 and 3.

Selling Stove Repairs.

"We have any number of amusing experiences, although some of them would try the patience of a saint," said a Chicago dealer to a newspaper reporter. "People will come to us who think we have enough information if they give us the name of their stove. An Irishman walked into our place the other day. He was one of those positive Irishmen who think it impossible to make a mistake.

"'Good mornin',' he began. 'Oi waa laid off yisterday, an' Oi just came down to git some fixins for the stove. The ould woman's been lackin' for a new back this long tolme.'

"'What kind of a stove is it?'

"'O, just a common ivery day stove.'

"'Does it burn coal or wood?'

"'It's a coal stove an' burns a divil of a lot of coal. Sure, it takes the best part of me wages buyin' coal.'

"'What is the name and number of it?'

"'No. 8 Star.'

"'Are you sure?'

"'Am Oi sure? Of course Oi'm sure. D'ye suppose Oi've sat in front of it for the last eight years an' not know what kind of a stove it is? Phat do you t'ink Oi am, a choomp?'

"'But there is no such stove made.'

"'Is that so? Maybe you t'ink you know more about it than Oi do an' ye niver sane the stove at all, at all'

"'Are you sure it isn't a Star No. 80?'

"'Sure? Of course Oi'm sure. Oi wouldn't have come down onless Oi knew phat Oi wanted. If you haven't got a No. 8 give me what you have got and Oi'll make it fit.'

"'But there are several kinds of Stars. Who is the maker, what is the date of the patent, and what is the size of the oven?'

"'An' do you have to know all that? Sure, the next toime Oi come down for a job loike this Oi'll aind some one else.'

"Then there is the 'handy' man, who comes in with a piece of string or a stick. There are knots in the string and nicks on the stick to show that the stove is 'so long and so deep.' When we tell him what is necessary before he can be accommodated he beats a hasty retreat. And there is the lady who thinks we are 'just horrid' when we tell her that we don't know what kind of a stove she has, that there are between 70,000 and 80,000 for which we have repairs, and that hers might be any one of them.

"The other day a German who keeps a second hand store was in here for some parts to two stoves that he had bought. He could not speak English very well, and as near as the clerk could make out the names of his stoves were the 'Sausage' and the 'Maggots.' As no such stoves were made to our knowledge, we were somewhat puzzled. Finally the catalogue was resorted to and the German triumphantly pointed out the names of his stoves. They were the Success and the Magnetic.

"Occasionally a man of the Spoopendyke order comes in. He wants a water front. He has the name and the details all right, and we give him tho part and suggest that we send a man to put it in for him. He declines our assistance, says he is used to these little jobs. He enjoys them. Besides, he isn't as big a fool as some people, who pay a man to do a simple little piece of work when they could save the money by doing it themselves. Next day he comes in crazy and wants to know what we mean by giving him the wrong front. Upon investigation it appears that he has taken out the fire brick all right, but has neglected to remove the shell, which makes the water front too large by about an inch.

"If people would be more particular to give us the right information they would have less trouble in having their stoves repaired."

ODD PLATES.

A "HARD TIMES" envelope of brown paper is used by the Michigan Stove Company in notifying their customers that a call will shortly be made by one of the company's salesmen. A sample of the notices thus mailed has been received. It is printed on parchment in two colors, red and black, and bears a remarkably strong resemblance to the ancient work of the early printers. The outside page of the notice has the word "coming" in bold letters, surrounded by an engraved design in leaf work. On the inside page the name of the salesman is given whose visit is to be expected. The whole arrangement is unique and attractive.

WEIR STOVE COMPANY, Taunton, Mass., are bringing out two sizes of a new square parlor stove known as the Grand Glenwood, highly ornamented both in the castings and nickel work, and designed for a high grade stove.

GEO. L. ROOD, representing the Royal heaters, manufactured by Hart & Crouse, has removed to 79 Lake street, Chicago. His new quarters are on the ground floor, presenting improved opportunities for displaying his goods and greatly facilitating the dispatch of business.

B. W. DODSON, late second vice-president of the Detroit Stove Works, has retired and is not now connected with the stove business, in which he has figured so prominently for years.

TAUNTON IRON WORKS COMPANY, Taunton, Mass., continue to offer the Quaker Prize range in four sizes, fitted with either plain, draw center or triangular grate, and having, it is claimed, a perfectly ventilated oven. This concern are sending to their customers a life sized *papier-maché* figure of a Quaker, which is very durable and makes an excellent show card for inside or outside use.

W. M. SHADDINGER, secretary and Western manager of the Detroit Stove Works, has removed to Chicago and will hereafter give personal attention to the details of the Chicago branch house, at 2921 to 2929 La Salle street.

THE EMPLOYEES of the Corning Stove Company, Corning, N. Y., expressed their pleasure at Postmaster Drake's confirmation, recently, by a vigorous use of the whistle attached to the plant.

THE BUSSEY & MCLEOD STOVE COMPANY, at Troy, N. Y., shut down their plant last week owing to the fact that orders were slack and some difficulty was experienced in getting coke.

THE NEW YORK STOVE WORKS, Peekskill, N. Y., are sending out circulars showing their varied line of gas hot plates, sad iron heaters and ovens. They are also making a portable gas appliance that is adapted for use with coal ranges, both for cooking on the top and baking in the oven.

THE STORE of the Mount Penn Stove Works of Reading, Pa., at 111–113 North Second street, Philadelphis, Pa., makes a fine display of gas stoves, gasoline stoves and refrigerators, their coal ranges being attractively arranged to create a demand at a later season of the year.

NORTH DIGHTON CO-OPERATIVE STOVE COMPANY, North Dighton, Mass., will soon bring out in all regular sizes a new medium priced range, known as the Oakland A. It will be fitted with any style grate desired and will have a nickel top rail and an elevated shelf.

F. M. BORDEN & BROTHER, 118–122 North Second street, Philadelphia, Pa., note a substantial increase in the demand for gas cooking apparatus this year. They make a specialty of the Reliable gas ranges and Game gas hot plates. These, with gasoline goods and the Challenge Iceberg refrigerators, furnish them a lively trade. The Erie aluminum tea kettle is attracting considerable attention with their trade, and increasing sales are the result.

J. ELWOOD YEAGER, manager of the Yeager-Hunter Spring City Stove Works, at 56 North Second street, Philadelphia, Pa., is showing a new range of the New Era series. It is a high oven square range of handsome appearance. The new features are sheet flue construction, which insures satisfactory operation, and a cut top, which avoids the possibility of the top cracking from heat, and is so constructed as to preserve the top level continuously. The range has a handsome nickel name plate and a nickel hearth, will all the conveniences and appurtenances of high grade goods.

THE CORNING MFG. COMPANY of Corning, N. Y., are meeting with a good demand for the Victor hot air furnace, which they manufacture and which has now been on the market for a little more than two years. Last season the sales in Corning of the heater were about two and a half times those of the year before. The business is growing to such an extent that the manufacturers have added a larger size to their assortment—the varieties now including Nos. 40, 43, 45, 50 and 60. A folder which reaches us from the company illustrates and describes the Victor hot air furnace, and also gives a few of the names of those who have used the heater.

WHITE, WARNER & CO., Taunton, Mass., report a very good sale for their new range, the Household Star, a medium priced stove made in two sizes and fitted, as are all Household ranges, with the White patent grate, which sifts the ashes and shakes the fire thoroughly at the same time.

ROBERTS, WINNER & CO., proprietors of the Quakertown Stove Works, Quakertown, Pa., have added to their assortment of goods two new ranges and a parlor stove. The latter, known as the Menlo, is made in two sizes, either straight draft or revertible flue. The ornamentation is of a pleasing character, the nickel top being so arranged that it may be taken off without removing any bolts or nuts. The new ranges are the Belmont and the Tip Top. These embody the modern improvements, are decorated in an effective style and are offered in several sizes. The goods have been well received during the short time they have been on the market, and the manufacturers expect for the Menlo a hearty reception upon its first appearance.

THE PORTLAND STOVE FOUNDRY COMPANY, Portland, Maine, have just brought out a high grade range called the Atlantic Grand. It is a high art range, designed in clay, has a new combination, low and high shelf and all the latest improvements in range construction. In ornamentation it is particularly rich and neat, gaudy and cheap looking effects having been carefully avoided. The edges are polished and the name plate nickel.

THE MARCH-BROWNBACK STOVE COMPANY of Pottstown, Pa., have opened a sample room at 312 Cherry street, Philadelphia, under the management of William M. Brownback, where they are showing a full line of all sizes of Crown hot air furnaces, steam heaters and hot water heaters. The location is a good one, and the new departure will undoubtedly be appreciated by the trade and others desirous of examining and placing orders for Crown heaters.

THE DETROIT STOVE WORKS of Detroit, Mich., are represented by a Jewel gas range in operation at the Pure Food Exhibition now being held at the Auditorium. The stove is situated in the kitchen, in the gallery of the exhibition, where the cooking of all foods required in the demonstrations is done and lectures on high art cookery given by Mrs. Rorer.

R E DIETZ COMPANY, 76 Fulton street, New York, report an increased demand for gas cooking apparatus, and are displaying a line of Dangler, Quick Meal and Cort ranges, besides a variety of hot plates and gas cooking appliances. They are showing the Dietz oil stove in all its various forms and report good sales.

THE EXCELSIOR STEEL FURNACE COMPANY, Chicago, Ill., shipped to Boston this week a carload of their furnace fittings, and included in the shipment a large number of oval stacks which they got up especially for the Eastern market and will hereafter make and carry for the Eastern and New England trade.

AT THE ANNUAL CONVENTION of the Western Gas Association held in Cleveland recently an interesting feature was the exhibition of gas burning appliances. The display was arranged in Army and Navy Hall and included exhibits by George M. Clark & Co., Schneider & Trenkamp Company, Standard Lighting Company, Cleveland Foundry Company, Wolff Gas Radiator & Mfg. Company, Dettlebach Stove Company, Taylor Burner Company, Miller Grate Company, Van Wie Stove Company, Maryland Meter Company, Milwaukee Gas Stove Company, Dan-

gler Stove & Mfg. Company, Favorite Stove & Range Company, Triumph Heating & Lighting Company, Gas Appliance Exchange, Western Gas Connection Company, Sloss Electric Gas Lighter Company and the Chicago Gas Stove Company.

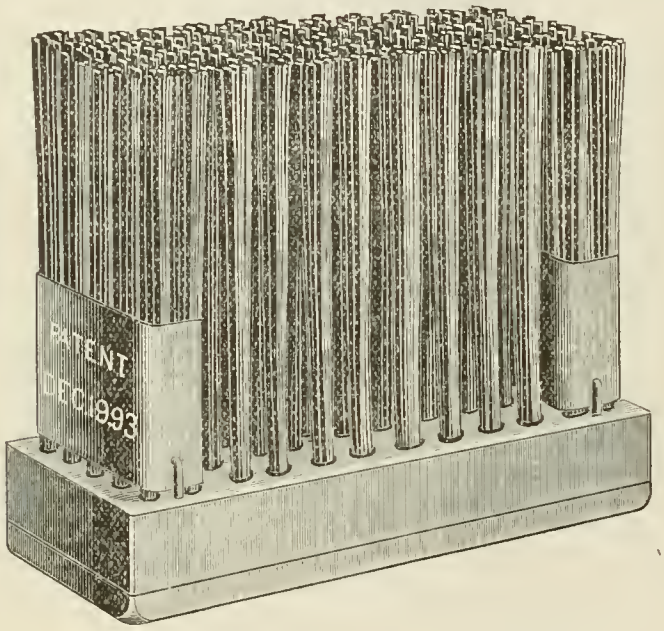
EDWARD ATKINSON of Boston, Mass., has issued an eight-page pamphlet descriptive of a new cooker which he has recently devised. The apparatus is referred to as being the most simple and effective, with the exception of what is known as the Standard Aladdin oven, which the inventor has brought out, and it is illustrated by means of sectional views in the pamphlet mentioned. The new cooker consists of a tin lined wooden box 1 or 2 inches thick, and designed to be placed bottom up on a metallic table, to which it is hinged. In the center of the table over which the box is placed is a hole 2½ inches in diameter, through which the top of a lamp chimney projects. Over the hole in the table is a double tube which is open at the bottom immediately over the top of the lamp chimney. The upper part of the tube supports a plate, the arrangement being such that it may be turned upon the lower tube so as to permit the heat from the lamp to pass directly into the box through openings provided for the purpose, or the upper tube may be turned upon the lower one so as to close the openings. In operation the box is tipped up and the cooking vessel placed upon the plate supported by the tube over the opening in the table, after which the box is lowered into position, forming an oven which, it is claimed, gives very satisfactory results.

EDWIN A. JACKSON & BROTHER, 50 Beekman street, New York, are displaying some handsome pieces of artistic wrought iron work. These goods comprise picture frames, easels, lamps, chandeliers and lanterns, fire stands, wood holders, and various designs of fire dogs. Three very handsome fire dogs represent storks and dragons. A set of dragon andirons in their window is particularly handsome in the dead black finish and gold bronze.

THE NEW YORK OFFICE of the Matthews & Willard Mfg. Company, 40 Murray street, in charge of F. M. Randell, makes a handsome display of onyx lamps, tables and cabinets and artistic metal goods. The house makes a full line of bronzes, urns and ornaments for stoves and stove trimmings in addition to the attractions shown at this branch.

Rice's Patent Bridled Foundry Brush.

It is a well-known fact that the drawn steel wire employed in foundry brushes is apt to break at the ends. The breaking at this point is greatest, owing to the fact that the wires are more free to vibrate than in the center, where they are largely prevented by contact with each other. If there was no more vibration at the ends than at the central portion of the brush, the end wires would break no sooner than the others, and the whole brush would wear uniformly until too short for further use. For the purpose of remedying this difficulty, the Rice Mfg. Company of New Durham, N. H., have placed a band or bridle around the end rows of the brush in such a way that while hinged to move freely and retain all the flexibility of a common brush, it catches the outside wires as they spring forward and immediately stops the vibration, which would otherwise continue. From an inspection of the engraving which we present herewith, it will be noticed that the bridle is fastened to the block in such a way that it can move freely on the hinge points. The manufacturers state that this device is cheaply applied and adds greatly to the durability of the brush, tests showing this durability to be twice and in some cases three times that of an ordinary brush.



Rice's Patent Bridled Foundry Brush.

The contract by which the Panama Railroad Company have been operating the steamers of the Pacific Mail Steamship Company, plying between New York and Colon, expires in June, and will not, it is announced, be renewed. The Panama Railroad officials have made arrangements to charter the three steamers of the late Brazil Mail Steamship Company, and now owned by the Standard Oil Company, from June 15. It is not unlikely that the move may lead to a sharp rate war.

Utilizing Blast Furnace Slag.

The disposition of blast furnace slag has long been a source of considerable trouble and expense to blast furnace operators, especially to those concerns who are compelled to remove it a considerable distance from the furnace. However, if a process for the utilization of this slag, shortly to be tried at the blast furnaces of the Edgar Thomson Steel Works, at Bessemer, Pa., proves successful this trouble and expense will not only be removed, but will enable the pig iron maker to realize a profit instead. In February last the Carnegie Steel Company, Limited, placed a contract with the Roberts Mfg. Company of Pittsburgh, builders of steel link belting conveying and elevating machinery of all kinds, for the construction of some elevating and conveying machinery of special design. This machinery has been completed and delivered at Bessemer, and is now awaiting a preliminary test, which will be made just as soon as some necessary changes in the railroad tracks, now under way, have been completed. With this machinery it is proposed to take the slag from Furnace D and treat it in such a manner as will make it suitable for railroad ballast, foundations, roadways and other purposes. Briefly, the process consists in taking the hot slag into a series of iron pans, from which it is conveyed to a crusher, where it is broken into cubes 1¼ inches in size. After being reduced in this manner it is taken to a horizontal pan conveyor, which delivers it to an elevator. It is then delivered to a shaking grate, which clears away all dust and dirt, after which the material is loaded on cars run under the elevator and is ready for shipment. Should the initial test prove successful, contracts will be placed for such additional machinery as may be required to treat the slag from the nine furnaces at Bessemer. The machinery now awaiting test is said to be capable of taking care of 300 tons of slag per day.

The largest check valve ever made has just been completed at the works of the Ludlow Valve Mfg. Company, Troy, N. Y., to be used in the main water supply pipe in the city of Pittsburgh, Pa. The total weight is 52,375 pounds. The valve was cast in two sections, which when bolted together made the valve stand 13 feet and 7 inches high, its greatest circumference being 32 feet 6 inches. The iron of which this valve was made when tested showed a tensile strength of 34,450 pounds per square inch. The bronze showed a strength of 39,250. The thickness of iron in this valve was $4\frac{7}{16}$ inches. Under a pressure of 500 pounds per square inch, the actual pressure on the gate plate of the valve was 3,454,325 pounds. During the recent depression in business this company have been running on full time with a full force of men.

Judge Coxe of the United States Circuit Court of Southern New York, has granted an interlocutory decree at final hraring perpetually restraining William D. Hoffman from infringing the patents 404,332, 430,058, 465,349 on magnetic separators granted to Clinton M. Ball and Sheldon Norton, the property of the Magnetic Separator Company.

At a sheriff's sale lately, in Reading, Pa., the franchises, property, &c., of the Reading, Lancaster & Baltimore Railroad were sold for $65.

TRADE REPORT.

The Iron Market.

The fuel question is the one of absorbing interest to the Iron trade throughout the country. The scarcity of Coke has led to the closing down of all but a few of the furnaces in Pittsburgh, all in the Mahoning Valley and the Wheeling district, all but one in the Shenango Valley, and nearly all in Central and Northern Ohio. It is really only the Chicago district among all west of the Alleghany Mountains which has not been affected.

An increasing number of mills in the West are idle or are close to the end of their fuel supply, and some of the Eastern mills are finding it very trouble some to get enough gas coal for their producers. The result is that prices along the whole line of Finished Iron and Steel are firmer, and for the time being cut throat quotations are not being made. But as yet there has been no general or substantial advance, nor any improvement in price in proportion to the rise in values on spot raw material. Buyers show very few symptoms of alarm, and sellers are by no means confident. In many cases the fuel shortage, which restricts production, acts also in curtailing consumption.

It remains to be seen whether the deferred demand will be large enough when the trouble is over to keep the furnaces and mills so busy for a considerable period that they can hold out and get higher prices. Each week of enforced idleness will add to the chances in that respect, but as yet only the first feeble indications of it have appeared.

It is probable that a determined effort will be made at an early date to get the Connellsville Coke ovens into blast. So far as the soft Coal situation is concerned, the general conviction is that little can be expected in the way of settlement from the Cleveland conference.

Pig Iron.—There is a little more inquiry in the New York market, and on the part of sellers a tend ency to abstain from forcing the market. Foundry Coke is getting scarce, which is interfering with melting. Negotiations are pending for round blocks of Bessemer Pig. We quote standard brands $12.50 @ $13.25 for No. 1; $11.25 @ $12 for No. 2, at tidewater. Southern Iron, same delivery, $11.50 @ $12.25 for No. 1; $10.50 @ $11 for No. 2; $10 @ $10.25 for No. 3; $10.25 @ $10.75 for No. 2 Soft, and $10.50 @ $11 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is $9.75 @ $10.25.

Philadelphia advices indicate no special change in Foundry or Mill Irons, the supply being large, the demand light and sellers anxious for business. Prices vary according to circumstances, but standard brands command about last week's figures, say $11.50 for No. 2 X and $10.50 for Mill Irons, some a little more, some a little less, according to quantity, quality, delivery, settlements and other considerations incident to each particular case. General quotations for Philadelphia and near by points are about as follows:

Standard No. 1 Foundry X	$12.50 @	$12.75
Standard No. 2 Foundry X	11.25 @	11.75
No. 2 Plain	10.75 @	11.00
No. 1 Soft	11.50 @	11.75
No. 2 Soft	10.75 @	11 00

In the Chicago market sellers of local Coke Iron report that they have just had the best week's business for a month. It has not grown out of a general improvement, however, but the business has been placed by foundrymen here and there who have secured more orders for their products and are consequently covering their requirements. Good inquiries are still in hand, and prospects are excellent for a continuance of the buying movement. Concessions in prices are no longer being made, but on the other hand some effort is perceived to mark prices up a trifle. Southern Coke Iron is quiet, but some figuring is being done on a few fair sized inquiries. Quotations are given as follows for cash:

Lake Superior Charcoal	$15.00 @	$15.50
Local Coke Foundry, No. 1	11.25 @	11.50
Local Coke Foundry, No. 2	10.50 @	11.00
Local Coke Foundry, No. 3	10.00 @	10.50
Local Scotch	11.50 @	11.75
Ohio Strong Softeners No. 1	12.60 @	13.50
Southern Silvery, No. 1	@	11.50
Southern Silvery, No. 2	@	11.00
Southern Coke, No. 2	10.00 @	10.35
Southern Coke, No. 3	9.75 @	10.00
Southern, No. 1, Soft	10.25 @	10.50
Southern, No. 2, Soft	9.75 @	10.00
Tennessee Charcoal, No. 1	15.00 @	15.50
Tennessee Charcoal, No. 2	14.50 @	15.00
Alabama Car Wheel	17.85 @	18.00
Jackson County Silvery	15.00 @	16.00
Other Ohio Silvery	12.50 @	13.00

The very limited demand for Foundry Iron in the Pittsburgh district has prevented any advance being obtained for it. A number of furnaces in the two valleys that have heretofore made some Foundry Iron will run on Bessemer altogether when the Coke strike is ended. They say the demand for Foundry is so limited that it does not pay any longer to make it. The supply of Bessemer Iron in Pittsburgh and vicinity is about exhausted. Quotations are given as follows for close delivery:

No. 1 Foundry	$11.10 @	$11.25, cash.
No. 2 Foundry	10.50 @	10.75 "
No. 3 Foundry	9.75 @	10.00 "

Our Cincinnati reports indicate little change in the Pig Iron market at that center. Consumers who have Iron coming to them on contracts are a little more urgent to have them filled, and there are no large offerings for present or forward delivery. There is no difficulty in obtaining enough material to meet the current demand, which is of a jobbing character. There is no large consumption; even the Iron Pipe works are melting comparatively little Iron. The Stove works are working on short time. Agricultural works are doing comparatively little and contemplate an early season, so that the reduced output of Pig Iron by the furnaces is not causing the hardship to consumers which might have been expected. The demand is mainly for Coke Foundry Iron. Quotations are unchanged, but are scarcely more than nominal, as follows:

Southern Coke, No. 1	$10.25 @	$10.50
Southern Coke, No. 2	9.25 @	9.50
Southern Coke, No. 3	8.75 @	9.00
Ohio Soft Stone Coal, No. 1	14.50 @	15.50
Ohio Soft Stone Coal, No. 2	14.00 @	14.50
Lake Superior Coke, No. 1	12.50 @	13.00
Lake Superior Coke, No. 2	11.50 @	12.00
Hanging Rock Charcoal, No. 1	17.00 @	17.50
Hanging Rock Charcoal, No. 2	16.50 @	17.00
Tennessee Charcoal, No. 1	13.00 @	13.50
Tennessee Charcoal, No. 2	12.00 @	12.50
Standard Southern Car Wheel	16.25 @	17.00
Lake Superior Car Wheel and Malleable	16.25 @	16.75

There is no large business doing in the St. Louis Pig Iron market, where the Coal strike has had a hardening tendency on prices. The consumption of Iron is not heavy, many concerns running only half time and others even less. The local Stove manufacturers are not melting much Iron, and judging from the stocks of finished goods they have on hand, will not be compelled to increase their consumption of Iron very largely. The outlook is a trifle better, but cannot yet be called encouraging. Quotations are as follows for cash, f.o.b. cars St. Louis:

Southern Coke, No. 1 Foundry	$10.75 @	$11.00
Southern Coke, No. 2 Foundry	9.75 @	10.00
Southern Coke, No. 3 Foundry	9.50 @	9.75
Southern Car Wheel	16.75 @	17.75
Lake Superior Car Wheel	16.25 @	16.50
Ohio Softeners	14.25 @	14.50

Metal Market.

Pig Tin.—Prices have dropped somewhat and the market shows rather unsettled tone, attributable in part to lower London quotations by wire. The arrivals here have been fairly large, amounting in the past week to 425 tons. This, with 550 tons reported cleared from English ports, would seem sufficient to relieve anxiety of any immediate shortage in the supply in this market. Buying for consumption is referred to as being of very moderate volume. Jobbers' prices for small lots have been reduced to 20¼¢ @ 21¢ per lb for Straits Pigs and 21½¢ @ 22¢ for Banca.

Copper.—Slow business, tame interest on the part of buyers generally and rather soft undertone to values covers about all that there is to be noted in the way of feature so far as the local market is concerned, but lower London quotations are, at the least, slightly significant as bearing upon the general situation. The appearances are that there is more than enough copper to go around. The ruling price asked by dealers for small quantities of Lake Ingot is 10½¢ ℔ lb.

Sheet Copper.—The demand for Cornice Copper does not expand to any visible extent, and the market is dull and disappointing. Prices are inclined to weakness, while manufacturers are actively seeking orders. Some of the largest Copper works are running only on partial time pending a turn for the better in the demand.

Pig Lead.—The market has been weaker and lower coat has not lubricated the wheels of business in any marked degree. Consumers manifest extreme indifference, orders being, in the main, of a small and insignificant character. American Pig in small lots from store is quoted by jobbers gen-

erally at 3⅞¢ @ 4¢, the bulk of business being done at the lower figure, or even a trifle less.

Lead Pipe and Sheet.—Little beyond a feeble and perfunctory business is noted in Manufactured Lead in this section. The restricted character of dwelling house building operations now in hand gives small promise of any immediate expansion of the demand for plumbers' supplies. No great improvement is looked for in this quarter before the fall. While discounts are nominally maintained at the list rates, prices are said to be inclining to softness in some quarters.

Spelter.—Some effort was made to move prices upward on the strength of reports of smaller production and concentration of supplies, but the market subsequently relapsed in a manner rather surprising to dealers and there has been pronounced softness since, indicating that the available supply is quite sufficient. Besides being weak in tone, the market is dull here, sales being almost entirely confined to comparatively small quantities for present consumption. For small jobbing parcels of ordinary Western Spelter the ruling price is 4¼¢ ℔ lb, with the usual premium on fancy brands. Stocks in first hands are not heavy, and any strong demand would quickly absorb what Spelter there is unsold.

Antimony.—Aside from routine jobbing business little has been done in this metal, and the market is rather soft. In small lots Cookson's is quoted at 10¾¢ and Hallett's at 10¢ ℔ lb.

Nickel.—Prices have undergone no radical change. The extremes are 45¢ @ 55¢, according to size of lot, &c. The demand is of ordinary character.

Tin Plates.—The market has shown little or no improvement over that of last week, although slightly more interest has developed in favored deliveries. Inquiries have, however, crystallized into but very moderate business so far. Can makers seem to be behindhand with their purchases, notwithstanding that canning prospects are reported to have improved. Consumers appear to be postponing the filling of requirements to the last possible moment, in view of tariff changes. Such contracts for future delivery as are made always contain a proviso in regard to duty. Spot business shows no increase in aggregate volume and has been irregular, with very close figuring on prices the rule. If anything, the buyer still holds the advantage, although stocks here are only fair and the assortment rather poor. A temporary scarcity is noted in some lines of imported Plates, particularly those of special sizes. Roofing Ternes show the most activity, and American manufacturers of this material are said to be well supplied with orders. In the West Tin Plates are reported to be moving freely. They are still scarce in the Chicago district, and jobbers are regularly advising their traveling men of actual stocks on hand, so that no sales will be made which cannot be immediately filled from stock.

Sheet Iron.—Although jobbers in this vicinity speak of almost absolute stagnation in the demand for Sheet Iron, the mills are said to be well supplied with orders, and are mostly reported as busy. Scarcity of fuel, in consequence of the strikes, is likely to cause the shutting down of some of the mills, however, within the coming week. On the strength of a threatened contraction of output prices for galvanized sheets have hardened during the past week, and Black Iron makers are also said to be contemplating an advance.

Chicago Report.

Scrap.—The trade in Old Material shows no sign of improvement. Dealers furnish the following list of buying prices, Chicago delivery:

	Per net ton.	Per lb
No. 1 Wrought Scrap	$7.00	....
Machinery Cast	6.00	....
Malleable Cast	5.00	....
Stove Plate (free of burnt)	4.00	....
Burnt Iron and Grate Bars	3.00	....
Sheet Iron and Hoops	2.00	....
Plow Steel and Breaking Stock	4.00	....
No. 2, such as Shovels, Hoes, &c	3.00	....
Old Boilers—whole (Iron)	3.00	....
" (Iron)—cut in single Sheets and Rings	5.00	....
Old Gas-Pipe and Boiler Tubes	5.00	....
Cast Borings	3.00	....
Turnings	4.00	....
Horseshoes	8.00	....
Copper Bottoms	....	5½¢
Copper Clips and Heavy	....	7 ¢
Heavy Brass	....	5¼¢
Light Brass	....	3 ¢
Pipe Lead	....	2¼¢
Tea Lead	....	2 ¢
Zinc	....	2 ¢
Rubber	....	3½¢

Anthracite.—Business is very quiet. The scarcity of soft coal has not yet driven trade to anthracite. Carload lots of 12 net tons or over are quoted as follows:

	Grate.	Egg, Sto. and Ch
Chicago, Ill	$5.00	$5.25
Milwaukee, Wis	5.00	5.25
Kansas City, Mo	8.20	8.45
Council Bluffs, Iowa	8.20	8.45
Lincoln, Neb	8.35	8.60
Sioux City, Iowa	8.20	8.45
Aberdeen, S. Dak	8.25	8.50

Trade Notes.

BURGESS SOLDERING FURNACE COMPANY, Columbus, Ohio, advise us that business for the past three months has been very good, and they refer hopefully to the outlook for the future.

D. M. STEWARD MFG. COMPANY, Chattanooga, Tenn., report the demand for goods in their line as fairly good, orders, while smaller than usual, being more numerous. They state that they are constantly adding to their customers in Crayons and Pencils, and that orders keep coming in at such a rate as to preclude the possibility of getting a stock ahead, the company being sometimes three or four weeks behind orders.

THE EXCELSIOR STEEL FURNACE COMPANY, 38 West Monroe street, Chicago, present some statistics in their advertisement this weeek. They state that over 5,000,000 feet of hot air pipe are used yearly, or over 1000 miles, equivalent to over 3 miles for every working day. They modestly say they would like to make all this pipe, and we believe they are sincere in their wish.

IRA G. LANE, 207 East Sixty-fourth street, New York, sends us an attractive card devoted to the National Revolving Chimney Tops, which he manufactures. These are designed for use on top of chimneys which are troubled with irregular drafts from various causes.

H. H. LINDEMUTH of the Raymond & Campbell Mfg. Company, Middletown, Pa., has invented and is about putting on the market a tool which will readily commend itself to the trade. It is a pipe reamer for beveling the ends of pipe after it has been cut. Few fitters realize the actual decrease of the bore in pipe where the ends are turned up in cutting, and many cases of supposed miscalculations are traceable to this source. With the new tool a bevel is given to the inside ends, which insures an unobstructed connection and consequently a full way. The tool will be made in two sizes, No. 1 cutting pipe from ⅛-inch to 2-inch and No. 2 2-inch to 4-inch. We understand the price of the article will bring it within the reach of the whole of the trade.

J. HERBERT HIGGINS and Caleb M. Andrews have formed a copartnership for the purpose of carrying on the scrap iron, metal and turning business at 79 to 83 Mathewson street, Providence, R. I., under the name of J. H. Higgins & Co.

THE PHILLIPS TIN PLATE COMPANY, makers of tin and terne plates, and F. R. Phillips, have removed their offices to 918 Filbert street, Philadelphia, where they have leased for a number of years more commodious and suitable quarters for the proper display of their manufactures in tin and terne plates and proper facilities for exhibiting the various improvements in tin plate machinery now introduced and to be put on the market at an early date. W. Vernon Phillips will have charge of the tin plate company's department at their new quarters and F. Rees Phillips will assume charge of the company's works. F. R. Phillips will attend to the tin plate machinery, rolling mill, iron, steel and metal brokerage business.

The voyage of the Government torpedo boat "Cushing" from Washington to New York, last week, without touching the waters of the Atlantic, furnished a good illustration of the value of inland waterways for the transfer of war vessels from one point on the coast to another in time of war. The "Cushing" started down the Potomac River to Chesapeake Bay, proceeded up to Chesapeake City and thence crossed by the canal to the Delaware River, continued north to the Delaware and Raritan Canal, and by way of the Raritan River and Bay entered New York waters. She carried weight equivalent to her full equipment in time of war.

As the result of investigations recently made by the Commissioner of Navigation, that official estimates that Americans own and operate under foreign flags a steam tonnage equal to or greater than one-half the steam tonnage registered under the American flag.

Penny in the slot machines have been put under the ban in Chicago.

CONDITION OF THE

Hardware Trade.

THERE is a good deal of complaint on the part of manufacturers and jobbers in regard to the condition of business, the demand being only moderate and considerably less than the average. Reports from the retail trade indicate a relatively better business, though it does not, on the whole, attain to the usual volume. There is a fair demand for seasonable goods, but even these are not going quite as freely as when better general conditions prevailed. There is comparatively little building, though there are indications that there will be an increase in this direction, and Builders' Hardware is perhaps, on the whole, in somewhat better demand. Profiting by the experience of the past year, the trade are pursuing a careful policy and are avoiding purchases beyond their necessities, preferring to keep stocks low, and in some cases broken, rather than incur indebtedness in the discharge of which they may have difficulty. The condition of the market in regard to prices encourages this policy. The trade realize that during the past year, and even since January 1, there has been a perceptible shrinkage in the values of many lines, and they naturally desire to avoid further accumulations of stock, which may possibly be depreciated on their hands. Jobbers and manufacturers generally recognize the wisdom of this policy on the part of their customers, and are in many cases encouraging it by suggestions against overbuying when they see any disposition to do this. At the same time they are willing to make concessions in prices to houses of unquestioned responsibility, and as a result prices to close buyers are somewhat irregular and have on many goods a lower tendency. Comparatively few failures are reported or apprehended, the trade generally being regarded as in a sound and healthful state financially. The effect of the strikes is being felt to an increasing extent, and may have an important influence on production and prices of goods which lie near the raw material. The question as to the probable future course of the market is a difficult one, deserving careful attention on the part of the trade. Prices in many lines are exceedingly low, and it may be that in some cases they have touched bottom.

Advices from Chicago.—The volume of business in Shelf Hardware continues about as reported during the past two weeks. Jobbers characterize the condition of trade as very fair under the circumstances, although they say that they could handle a great deal more business without severely taxing their facilities. The demand now seems to be of a character which will be steadily maintained, as it rests entirely on the necessities of consumers and merchants. There is no speculation whatever in the buying which is now being done, and the break in freight rates to far Western points is not stimulating the demand from this jobbing center. Staple goods are comparatively quiet, except Barb Wire and Tin Plate, which are moving more freely than most classes of goods. Tin Plate is still scarce and jobbers are regularly advising their traveling men of actual stocks on hand, so that no sales will be made which cannot be immediately filled from stock. Heavy Hardware jobbers report a quiet condition of business with no prospects of an immediate improvement. The Indian warehouse established in this city was the point of much interest yesterday, owing to bids being received and opened for about $1,000,000 worth of supplies, in which are included large quantities of Hardware. Local manufacturers and merchants are very generally bidding.

Notes on Prices.

Wire Nails.—Owing to a variety of influences the Wire Nail market is in a perceptibly stronger position than at our last review, and higher prices are ruling. This is owing in part to the effect of strikes, which have either stopped or diminished the output of some of the mills, with a strong probability that still others will be similarly affected. There is also something of a quickening of the demand, which comes principally from the smaller trade buying in lots of one or two carloads, but at the same time it is understood that some of the large houses are in the market and will probably soon be obliged to replenish their stocks. The condition in the raw material also tends to stiffen the price. Under these conditions quotations for carload lots at mills are now $1 to $1.10, some mills refusing to sell at less than the latter figure. The price from other manufacturers is $1.05, but $1 is still obtainable. The market has a firmer tone, and it would not be surprising if a further advance were made, unless there is an early settlement of the labor difficulties. Small lots from store in New York are still quoted at $1.15 to $1.25.

Advices from Chicago.—The situation has now changed very decidedly in favor of manufacturers. Buyers can no longer dictate prices, but a firm basis has been established, with an advance of at least 10 cents per keg above the low rates prevalent some two weeks since. Factory lots are quoted at close to $1.10 Chicago. The manufacturers are very hopeful of advancing prices a little higher. They are encouraged in this belief by an improvement in the demand during the past week, including inquiries from large buyers who had been supposed to be well stocked. Jobbers quote small lots at $1.15, but report a rather light movement.

Cut Nails.—There has been little change in the Cut Nail market, but the effect of the strikes is perceptible, especially as manufacturers are indisposed to solicit business as eagerly as heretofore or to make concessions to induce orders. The factory price of Western Nails is about 90 cents, but concessions are made from this figure. This, during the past few weeks, had the effect of forcing down somewhat the price of the Eastern manufacturers. The Eastern mills are quoting 95 cents to $1 base for Nails delivered on dock in New York, their quotations for other points being based on a price at from 85 to 90 cents at mill. Small lots from store in New York are held at $1.10 to $1.15.

Advices from Chicago.—A nice run of orders is reported by Cut Nail manufacturers. They are selling for present delivery at the old price of 95 cents, Chicago, for 55 cent average, but will not enter contracts for future delivery, believing that prices will shortly advance on account of the scarcity of coal, as well as the expected restoration of freight rates to the East to their old figure. Small lots from stock are being sold by jobbers at $1.05 to $1.10.

Barb Wire.—The demand for Barb Wire continues fair, and the market is given a somewhat firmer tone in view of the effect of the strikes and the difficulty which is already experienced in operating plants. The advance in raw material also has its influence. On the other hand, trade is naturally diminished in volume and manufacturers are desirous of obtaining such orders as are in reach. Quotations for Four-Point Galvanized are as follows, delivered at the points named: Pittsburgh, $2.05 to $2.15; Cleveland, $2.10 to $2.20; Cincinnati or Allentown, $2.15 to $2.25; Chicago or New York, $2.20 to $2 30.

Advices from Chicago.—The manufacturers of ordinary Barb Wire in this vicinity have not yet entirely caught up with business entered some time since and consequently are firmly maintaining prices. The scarcity of fuel and the advance in Billets they insist will compel them to ask advanced rates on new business. Jobbers are having an excellent demand for Barb Wire from stock, which continues without any relation to the demand for Wire Nails. Quotations for small lots from stock are $2.30 to $2.35, and $2.20 for shipments from factory.

Wire Cloth.—The trade are experiencing something of a scarcity in Screen Wire Cloth, and as a result prices are higher with such manufacturers or jobbers as have a supply on hand.

Apple Parers.—During the coming season Apple Parers will probably sell at prices not materially different from those which ruled last year, but there is an apparent tendency toward somewhat lower figures. The revised quotations of Reading Hardware Company, Reading, Pa., for the season of 1894 are as follows:

	Per doz.
Reading, '72	$3.75
Baldwin	4.25
Advance	4.25
Reading, '78	6 75

Little Giant Steel Truck.—The Little Giant Steel Truck, put on the market by the G. L. Van Namee Mfg. Company, Syracuse, N. Y., is sold to the trade at $24 per dozen, net.

Golden Crown Asparagus and Corn Cooker.—This article is put on the market by the Stuart & Peterson Company, Burlington, N. J., by whom it is sold at $1.40 for the No. 1, $1.60 for the No. 2, and $2 for the No. 3, these prices being subject to a discount of 40 per cent. to the trade.

Fresh Air Inlet and Hitching Post.—Edward M. Stirling, 85 Market street, Newark, N. J., is manufacturing this article, which was illustrated in our issue of April 28. It is sold to the trade at $12, less a discount of 30 per cent.

Frazer Axle Grease.—The following is the price-list of the Frazer Lubricator Company, 83 Murray street, New York, terms net, f.o.b. New York:

	Per gross.
Small wood boxes, gross lots	$9.50
Small wood boxes, half gross lots	10.00
	Per dozen.
Five-pound wood boxes, with bails	$3.25
Ten-pound wood boxes, with bails	6.00
Small tins, with bails	1.37½
Medium tins, with bails	2.75
Large tins, with bails	4.50

Bulk.

	Per pound. Cents.
Wood pails, 15, 25 and 32 pounds	5
Tubs, 36 and 71 pounds	4
Kegs, 112 pounds	3½
Half barrels, 225 to 250 pounds	3½
Barrels, 400 to 475 pounds	3½

Diamond X.

	Per gross.
Small wood boxes	$7.00
Small tins, with bails	14.00

Soldering Coppers and Irons.—In the revised discount sheet of the Covert Mfg. Company, West Troy, N. Y., the following terms are given on Soldering Coppers and Soldering Irons:

			Per cent. discount.
Soldering Coppers			35
Doz.	$3.10	4.30	5.10
Nos.	380	382	384
Doz	7.00	8.20	
Nos.	386	388	
Soldering Irons			35

Nos.	350	352	354
Doz.	9.50	10.75	
Nos.	356	358	

Sheet Zinc.—A revised discount sheet under date May 10 has been issued by Matthiesaen & Hegeler Zinc Company, La Salle, Ill. The base price, $4.50 per 100 pounds, remains unchanged, but revised discounts are announced as follows:

Discounts.	First class. 15 600-pound casks and upward.	Second class. 10 to 14 600-pound casks.	Third class. 5 to 9 600-pound casks.	Fourth class. Under 5 600-pound casks.
	Per cent.	Per cent.	Per cent.	Per cent.
Special	9	9	9	9
Cash with order	3	3	3	3
Quantity	3	2	1	0
Totals	15	14	13	12

Glass.—A more active demand for Window Glass is reported from the West than in the East, local trade showing somewhat of a falling off within the past week or two. Firmer prices, the nearer approach to the time for the annual shut down of factories and the apprehension of a shortage of Glass during the summer months, have caused some factories hitherto idle to start up. Pittsburgh factory quotations are reported as being 85 per cent. discount for single and 85 and 5 per cent. discount for double strength Glass, while manufacturers generally show a disposition to maintain rather than to cut these prices. The discounts given fairly represent the market at large, with possibly concessions in some instances reducing prices to 85 and 5 per cent. discount for single and 85 and 10 per cent. discount for double strength Glass. French Window Glass is still quoted at 70 and 10 per cent. discount. Plate Glass is in somewhat greater demand, with prices ranging from 70 and 5 to 70 and 10 per cent. discount.

Old Metals.—The market for Old Metals is very tame, and dealings are on a narrow scale. The demand for Scrap Iron continues slack, but prices maintain their former level. The following quotations represent dealers' purchasing prices in New York City:

Heavy Copper	℔	lb	7½¢
Light and Tinned Copper	℔	lb	6½¢
Heavy Brass	℔	lb	5½¢
Light Brass	℔	lb	4½¢
Lead	℔	lb	3¢
Tea Lead	℔	lb	2¢
Zinc	℔	lb	2¾¢
No. 1 Pewter	℔	lb	14¢
No. 2 Pewter	℔	lb	7¢
Wrought Scrap Iron, ℔ gross ton	$9.00	@	....
Heavy Cast Scrap, ℔ gross ton	7.00	@	....
Stove Plate Scrap, ℔ gross ton	4.50	@	....
Burnt Iron, ℔ gross ton	3.00	@	3.50

Old Rags, Paper, &c.—The demand for this material has been good and prices remain steady at former quotations, namely:

No. 1 White Rags	℔	lb	3¼ @ 3½¢
No. 2 White Rags	℔	lb	2 @ 2¼¢
Mixed Rags	℔	lb	¾¢
Blues and 3ds	℔	lb	1 @ 1½¢
Hard Sized White Shavings	℔	lb	2¼ @ 2½¢
No. 1 White Book Shavings	℔	lb	1½ @ 1¾¢
No. 2 White Book Shavings	℔	lb	1 @ 1⅛¢

Manila Rope	℔	lb	2⅛ @ 2¼¢
Jute Rope	℔	lb	1½ @ 1¾¢
Mixed Rope	℔	lb	¾ @ ⅞¢

Old Rubber.—The market for Old Rubber is fairly active, but prices are irregular. The following quotations represent approximately dealers' purchasing rates, New York City delivery:

Car Springs, ton lots, ℔ lb.	....	@	$0.03½
Rubber Shoes, carloads, delivered at factory, ℔ lb.	....	@	.03½
Rubber shoes, less than carloads, ℔ lb.		@	.03¼
Large Hose, ℔ ton	....	@	12.00
White Wringer Rolls, ℔ lb.	....	@	.03¾
White Syringes, ℔ lb		@	.03¾

Trade Notes.

HESS, SNYDER & Co., Masaillon, Ohio, have just issued a Pump catalogue giving complete and detailed descriptions of their Novelty Force Pumps, which comprise a line suitable for shallow or deep wells, cisterns or for spraying purposes. The catalogue, in addition to the descriptions, with price-lists and tables of sizes, gives illustrations of the Pumps, and at the close attention is directed to Chimney Ventilators.

THE JERSEY CITY GALVANIZING COMPANY have opened a store at 112 John street, opposite Cliff street, New York, where they intend adding a general jobbing business in Plain and Galvanized Sheet Iron, Corrugated and Formed Sheets, Zinc, Spelter and Galvanized Specialties generally, as set forth in their advertisement elsewhere.

LISK MFG. COMPANY, LIMITED, Canandalgua, N. Y., issue circulars to the trade directing their attention to the fact that all of the goods manufactured by the concern are warranted not to rust. Quoting from their circular, they say: "We will make good this guarantee by replacing, free of charge, any articles which may be brought back to you in a rusty condition or prove otherwise defective. Should any such be found our agent will take pleasure in attending to the matter when he makes his next call." The firm also issue a large card notice to this effect, so that dealers may post it up in their stores, and all their customers may see the conditions. The Lisk Mfg. Company also send an official looking document headed "Guarantee," which certifies to the name of the agent for their patent anti-rust tinware and contains a copy of the terms of their guarantee, and is signed with *fac similes* of the autographs of the officers of the company.

MANUFACTURING.

Hardware.

It is reported that a reduction in wages varying from 25 to 40 per cent. is to be made in several departments of the Winsted Edge Tool Company, West Winsted, Conn.

The Howe Scale Company, Rutland, Vt., have commenced running on full time.

The capital stock of the Chelsea Wire Fabric Company, Chelsea, Mass., has been increased $10,000 by vote of the directors.

The Wisconsin Iron & Wire Works of Milwaukee, Wis., have been incorporated. The company succeed G. H. Norris in the ownership of the Reliance Wire Works, which Mr. Norris recently purchased from D. D. Williams. The capital stock of the new company is $30,000, and the incorporators are G. H. Norris, J. G. Beckley and J. H. Gilmau. Mr. Norris is president of the company, Mr. Beckley vice-president, and Mr. Gilman secretary and treasurer.

Burgess Soldering Furnace Company, Columbus, Ohio, advise us that business for the past three months has been very good, and they refer hopefully to the outlook for the future.

D. M. Steward Mfg. Company, Chattanooga, Tenn., report the demand for goods in their line as fairly good, orders, while smaller than usual, being more numerous. They state that they are constantly adding to their customers in crayons and pencils, and that orders keep coming in at such a rate as to preclude the possibility of getting a stock ahead, the company being sometimes three or four weeks behind orders.

E. Blair, Bucyrus, Ohio, advises us that he has sold 50 per cent. more swine jewelry during the first four months of 1894 than he did during the same period last year. Mr. Blair is making arrangements for the manufacture of another line of hog ringers.

A. J. Phillips & Co., Fenton, Mich., advise us that their sales of screen doors thus far this year are largely in excess of their total shipment last year. Their factory was in operation all through the fall and winter with a full force and on full time and pay, in anticipation that when the season had arrived there would be the usual shortage in screen goods, and perhaps more of a shortage than in former years. They state that screen goods are coming to be considered as staple articles and as almost of necessities, if the sales during this, an off year, count for anything, nearly all of the leading factories on screen doors being busy. A notable feature of the market this season is that screen doors of the better grades have been increasingly ordered, an unusually large number of fancy pattern screen doors having been devised. The running of their factory during the fall and winter has enabled the firm to accumulate a very nice stock and assortment of window screens and screen frames, and they think that their capacity will enable them to keep their assortment good until the end of the season.

Standard Company, 57 Haverhill street, Boston, have enlarged and improved their well-known Dover egg beater, confident that its sale will be thereby increased.

Plumb, Burdict & Barnard, Buffalo, N. Y., having outgrown the plant they now occupy, have commenced work on their new factory at North Tonawanda. They hope to have the new works completed by the coming fall. The new plant will be operated by electric power.

John Sommer's Son, Newark N. J., refers to the favor with which his Boss lemon squeezers are received by the trade. These squeezers are described as made out of hard sugar maple, finely finished, with strong nickel plated hinges, overlapping ends and large smoothly polished lignum vitæ bowl. The cleanliness, durability and cheapness of these lemon squeezers are points which are made in regard to them by the manufacturer.

Levin Pruner Company, 37 Dey street, New York, advise us that their pruner has made its way into almost every country on the globe and that it has apparently come to stay.

Wabash Screen Door Company, Rhinelander, Wis., are having a much better business than they had any reason to hope for considering the times. They advise us that they are at this time fully up to last season's trade, and if business continues throughout the next sixty days, as the prospects now indicate, they will sell a larger number of screen doors this year than ever before, the company estimating their output at over 325,000 doors. They state that the greatest surprise in this season's business is the increased demand for fancy doors or doors of better quality. Up to the present time they have shipped more fancy doors than they did during the whole of last season.

Buck Bros., Millbury, Mass., have received a letter from Geo. S. Waite, superintendent of the Toledo Manual Training School, Toledo, Ohio, in which reference is made to the satisfaction which has resulted from the use of their tools in the school work. During the past eight years the school has purchased from Buck Bros. 100 sets of carving tools, 144 sets of carpenters' chisels and 72 sets of wood turning chisels. Some of these tools have been in use for the whole of that period and are referred to as having given splendid service.

Miscellaneous.

The Pittsburgh Crushed Steel Company, Limited, patentees and sole manufacturers of steel emery and crushed steel, have recently completed the erection of an addition to their plant 60 x 100 feet in size.

At a meeting of the board of directors of the Daniels Steel Railroad Tie Company, held in Youngstown, Ohio, on May 5, the resignation of Mr. Daniels as chairman of the concern was presented and accepted and Thomp Burton was elected to succeed him and is now holding the dual position of president and general manager. Hon L. C. Ohl was added to the board of directors and was elected vice president of the concern.

The Appleton Mfg. Company of Appleton, Wis., have begun the work of removing their implement factory to Geneva, Ill.

Building Restrictions.

The past few years have witnessed great advances in the enactment of laws designed to so control the erection of buildings as to render them in every way safe for the occupants. Scarcely a city of any size can now be found that does not possess a code of building laws, while sizes of timbers, thicknesses of walls, provisions for escape in case of fire, as well as precautions to prevent fire itself, are all to be in accordance with the said laws. In the larger cities competent inspectors have laid upon them the duty of enforcing the laws, and, as a rule, in a somewhat less efficient manner, the matter receives attention in smaller municipalities. Of most interest to our readers is the subject of heating in its relation to legal protection against fire. Much of the good legislation in this line has been at the instigation or through the co-operation of the fire underwriters. They are certainly in a position to accurately judge of the practical efficiency of any arrangements that may be legalized, but too frequently their good judgment has been outweighed by exigencies of politics. Thus many laws of this character bear the marks of the influence, politically applied, to make the restrictions agreeable to persons who look only for the cheapest but not the best way in all things.

Diversity in Building Laws.

As a consequence there exists to-day a surprising diversity in the laws relating to the installation of heating systems. It is obvious that only one of them all can be exactly right, and yet the variety is to a certain extent excusable when we consider that in many cases the law makes the arrangement more than safe enough, and hence differs from those which approach nearer the danger line. Nowhere is this more noticeable than in the matter of permissible distances between heating pipes and adjacent wood work. Even a superficial inspection of the building laws relating to hot air pipes in some of the principal cities of the country will serve to clearly show this wide diversity. Thus, in Boston the law reads that all hot air pipes shall be 1 inch from the wood. The same holds true with steam pipes, and this distance must be maintained with either hot air or steam pipes unless the wood work is protected by metal casing or by stone or earthen ring. The laws in Providence and St. Louis are substantially the same. In Chicago, however, we find the other extreme. Here the hot air conductors, if placed within 10 inches of the wood work, must be made double, with at least ½ inch air space between the two. Steam pipes, on the other hand, need be kept only 2 inches from wood unless protected. Chicago, like many other cities, very exclusively dictates the material to be used in the construction of its pipes—in this case IC or IX bright tin. Under the law, literally followed, galvanized iron cannot be used. Of course it is, however, and the crudeness of the law thereby illustrated. The Cleveland restrictions are nearly the same, except that the steam pipe distance is increased to 6 inches, and the Milwaukee law is identical with regard to hot air pipes. Memphis has an elaborate series of restrictions. It dictates that all brick or stone hot air shafts shall be lined with tin pipes, something very desirable, it must be admitted, but entirely unnecessary, as a matter of fire protection, under all ordinary conditions. Elaborate arrangements are required in the case of all flues; thus it is necessary, under the law, that all metal flues or pipes for the conduction of heated air shall be inclosed with 4 inches thickness of hard incombustible material, except in the case of horizontal pipes, which must be double, the inner one 3 inches from the stud, with ½-inch air space between itself and the water pipe. In addition, the inside faces of the exposed stud must be well lined with tin plate and the outside with iron lath or slats. Horizontal hot air pipes must furthermore be kept 6 inches below floors or ceilings if they are unprotected, or 3 inches if protected by a metal shield. Hot air pipes passing through partitions must have 4 inches of brick insulation or else a double collar of metal with 2 inch air space and holes for ventilation. Steam pipes may be placed within 2 inches of wood work, or within 1 inch if protected by metal shield. New York City has a code of regulations practically identical with that of Memphis. Cincinnati makes the required distance of steam and hot air pipes 6 inches from unprotected combustive material, but makes all arrangements subject to approval of inspector. Detroit limits the distance to 3 inches. Denver requires metal flues to be double or wrapped in incombustible materials if not placed in stone or brick walls. San Francisco has a similar law, which specifies that the double pipe shall have ½ inch space filled with fire proof material.

Opportunity for Revision.

Many more examples might be given, but enough has been shown to indicate that there are either most reckless risks taken under some of the laws, or else the safeguards prescribed in others are practically unnecessary. Notwithstanding the numerous experiments that have been made, it is still an open question just how far removed wood work must be from steam and hot air pipes to avoid danger by fire. Of course, this uncertainty is largely due to the conditions under which the pipes are installed and the system is operated, and a distance that is safe where there is ample ventilation around the pipe may become dangerous when the pipe passes through a partition and opportunity is given to overheat both air and wood work. It would seem that the most practical method of revising existing laws which have proved unsuitable would be to carefully and exhaustively study the laws of other municipalities in connection with the reports of the fires occurring within their limits. The inspectors, the fire department and the underwriters are all supposed to express, when possible, their knowledge or belief in the cause of a fire, and the extended examination of such reports must serve to show the adequacy of existing laws. In connection with the celebrated trial of the Chicago Anarchists, the judge gave us in a single sentence the spirit that should rule in all law making: "The law is common sense." Most truly is common sense called on to establish the perfect and comprehensive building laws that are necessary in every community to protect its citizens, so far as may be possible, from all danger through improper construction of their dwellings, their factories, and their places of amusement, instruction and worship.

A Boston Trade School.

In another column will be found some details in regard to one of the latest additions to the trade school movement in the United States, the plumbing school started in January last in connection with the North End Union of the city of Boston. The success of this school during its brief existence indorses the conviction, so often expressed by advocates of the trade school system generally, that the establishment of such vehicles of definite trade instruction is loudly called for

by the classes for whose benefit they are designed. Every opportunity of the kind that has been offered to American boys has been eagerly seized upon, and the number of applicants for instruction has usually—as in this case—far exceeded the available accommodation. This has been the history of the plumbing classes, at least, in New York, Brooklyn, Philadelphia, and other cities where trade schools are in operation, and it is not surprising that the Boston school should have had the same experience. If the resolution of the trustees of the Franklin legacy to establish therewith, in Boston, a trade school of noble proportions is firmly adhered to, the city will receive a still wider benefit in this line.

Leaders in Steam Heating.

It was not so long ago that information on hot water heating was sought altogether from England, because this method of heating, in one way and another, had been in use there for a number of years. With the more convenient fittiugs made in the United States and the use of wrought iron pipe, however, rapid advance was made in the work, and less dependence was placed upon the teachings of English practice. In steam heating the case is just reversed, and engineers of foreign countries seek information in the United States with the same interest and confidence with which they themselves were formerly consulted respecting hot water. Architects in England, France, Germany, Russia and the Scandiuavian Peninsula have sent plans of projected buildings to leading engineers in this country for instruction as to the method of heating by steam. These plans have been returned with a description of the necessary plant and full explanation of the rules used in calculating the surface required on the heat unit basis, and drawings have been furnished showing the method of installing the plants from the heating apparatus to the smallest detail of the piping. In a number of instances the heating apparatus, pipes and fittings, with valves and radiators, have been shipped abroad, each part being marked and described so that the plant could be erected entirely by foreign labor.

In consequence of the recent discovery of frauds in the Boston Custom House, Secretary Carlisle has issued an order to the special Treasury agents directing them to examine every bonded warehouse in the country. The agents in New York City have already begun their inspection, which it is estimated, will occupy one year at least, as there are some 70 to be gone through.

Last week was a sad one for the fire insurance companies in the East. Beginning with the destruction of the Brooklyn Tabernacle and the adjoining hotel on Sunday, May 13, almost every day scored records of large and destructive fires in New York, Boston, Brooklyn and Philadelphia.

Institute of Building Arts.

The Institute of Building Arts is a permanent exhibition of building materials and improvements, and is owned and conducted by the Illinois Chapter of the American Institute of Architects at 63 to 69 Washington street, Chicago. The institute was established for the purpose of centralizing information relating to building, and congregating in permanent exposition all materials, appliances or inventions of a practical or ornamental character. The building is free to the visiting public, who are welcome to all its advantages and information and to the inspection of the numerous exhibits it contains. It embraces a library of architectural works, including files of all architectural and building journals, and contains assembly rooms for the meetings of all associations connected with architecture and the building arts.

The Illinois Chapter of the American Institute of Architects will hold their first annual special building trades and material exhibition at the Institute of Building Arts, from May 15 to June 2, 1894, inclusive. It will be known as the Chicago Building Trades and Material Exhibition, and will be held in the new permanent addition to the institute, which now comprises the larger part of the second floor of Nos. 67 and 69 Washington street, besides the whole of the second floor of Nos. 63 and 65. The exhibition will be supplementary to the permanent exhibit of the Institute of Building Arts, which has been in existence for many years. The privilege of exhibition is given not only to manufacturers, manufacturers' agents or contractors, or the proprietors of any building material, but the artisans, mechanics, decorative artists, wrought iron workers and carvers who may desire to show specimens of their mechanical or artistic skill. Among the permanent and special exhibitors at the institute can be mentioned the following :

Boiler Attachments.—Reliance Gauge Company, Cleveland, Ohio.

Blinds.—Willer Mfg. Company, Milwaukee, S. A. Bradley, manager, 183 and 185 Dearborn street, Chicago.

Engines.—New York Safety Steam Power Company, 56 to 60 South Canal street, Chicago.

Elevator Guards, Railings, &c. — Northwestern Expanded Metal Company, Twenty-sixth street and Stewart avenue, Chicago.

Fire Proof Construction.—Bostwick Steel Lath Company, Niles, Ohio, W. G. Hurlburt, secretary, 161 La Salle street, Chicago; Guastivino Fire Proof Construction Company, 1300 Auditorium, Chicago; Mackolite Fire Proofing Company, 824 Schiller Building, Chicago; Northwestern Expanded Metal Company, Twenty-sixth street and Stewart avenue, Chicago; John A. Roebling's Sons Company, 171 and 173 Lake street, Chicago ; T. O'Shae, 80 Twenty-fifth place, Chicago.

Fire Proof Lath.—Bostwick Steel Lath Company, Niles, Ohio, W. G. Hurlburt, secretary, 161 La Salle street, Chicago; Northwestern Expanded Metal Company, Twenty-sixth street and Stewart avenue, Chicago; John A. Roebling's Sons Company, 171 and 173 Lake street, Chicago.

Gas Ranges —George M. Clark & Co., 135 to 161 Superior street, Chicago; Mason & Davis Company, 72 Lake street, Chicago; Milwaukee Gas Stove Company, Milwaukee, Wis.; Schneider & Trenkamp Company, Cleveland, Ohio, H. R. Hamilton, agent, 67 and 69 Lake street, Chicago.

Hardware Specialties. — Cannon & Gibbs, 397 W. Lake street, Chicago; Duplex Hanger Company, 584 Pearl street, Cleveland, Ohio; F. S. Hutchinson Company, West avenue and Sixth street, Long Island City, N. Y.; Lane Bros., Poughkeepsie, N. Y.; M. B. Swezey, 120 Twentieth street, Chicago; Reading Hardware Company, 73 Wabash avenue, Chicago.

Heating Appliances.—F. Farquhar & Sons, Blue Island, Ill.; W. H. Page Boiler Company, Norwich, Conn.; S. Wilks Mfg. Company, 113 to 123 Clinton street, Chicago.

Pipe Covering and Insulation.—A. C. Kemper, 208 and 210 Lake street, Chicago; H. W. Johns Mfg. Company, 242 Randolph street, Chicago; Western Mineral Wool Company, 437 Rookery, Chicago.

Plumbing Specialties —Alberene Stone Company, 219 Dearborn street, Chicago; B. P. Bower & Co., 41 Academy street, Cleveland, Ohio ; Wm. S. Cooper Brass Works, 442 North Thirteenth street, Philadelphia, and 219 Dearborn street, Chicago; Detroit Sanitary Supply Company, 37 First street, Detroit, Mich.; Du Bois Mfg. Company, 245 Ninth avenue, New York; G. C. Geraty, 307 East Fifty-fourth street, Chicago; Adams & Westlake Company, 110 Ontario street, Chicago; J. C. Hartford & Co., 57 Dearborn street, Chicago; L. Wolff Mfg. Company, 91 Dearborn street and 93 West Lake street, Chicago; P. H. Gunderman, 889 North Halsted street, Chicago; Thos. Kelly & Bros., 124 Franklin street, Chicago; Norton Bros., Masonic Temple, Chicago; Sanitas Mfg. Company, 217 Lake street, Chicago; Steel Bath Mfg. Company, Detroit, Mich.; J. J. Wade & Son, 276 Dearborn street, Chicago.

Pumps. — Erwin - Welch Hydraulic Machinery Company, 51 South Canal street, Chicago ; U. G. Reynolds, Chicago.

Registers and Ventilators.—Tuttle & Bailey Mfg. Company, 136 Lake street, Chicago.

Screens.—E. T. Burrowes & Co., Portland, Maine ; H. B. Dodge & Co., 65 Washington street, Chicago ; Willer Mfg. Company, Milwaukee, Wis., S. A. Bradley, manager, 183 and 185 Dearborn street, Chicago.

Sewer Specialties.—James Barrett, 193 Tremont street, Boston, Mass.; E. J. Flanedy, 168 South Peoria street, Chicago.

Steel Ceiling.—Fred. F. Bischoff & Co., 24 to 26 West Lake street, Chicago.

Valves —Chapman Valve Mfg. Company, 24 West Lake street, Chicago; Jenkins Bros., 31 North Canal street, Chicago.

Window Improvements. — Gardner Sash Balance Company, First National Bank Building, Chicago; Howarth Reversible Sash & Sash Center Company, 112 and 114 Antoine street, Detroit, Mich.; McDonough Mfg. Company, Eu Claire, Wis.

Wood Carving.—Gustave Behm, 641 Larrabee street, Chicago.

The Illinois Chapter of the American Institute of Architects informally opened their new library and assembly rooms, Monday evening, May 14, in connection with the first annual exhibition of the building trades and materials. There were in attendance the most prominent architects of Chicago, builders and exhibitors. Special medals of silver are to be made after designs furnished by George Beaumont, and these are to be awarded to such exhibitors as may be deemed entitled to them by a jury of experts to be appointed.

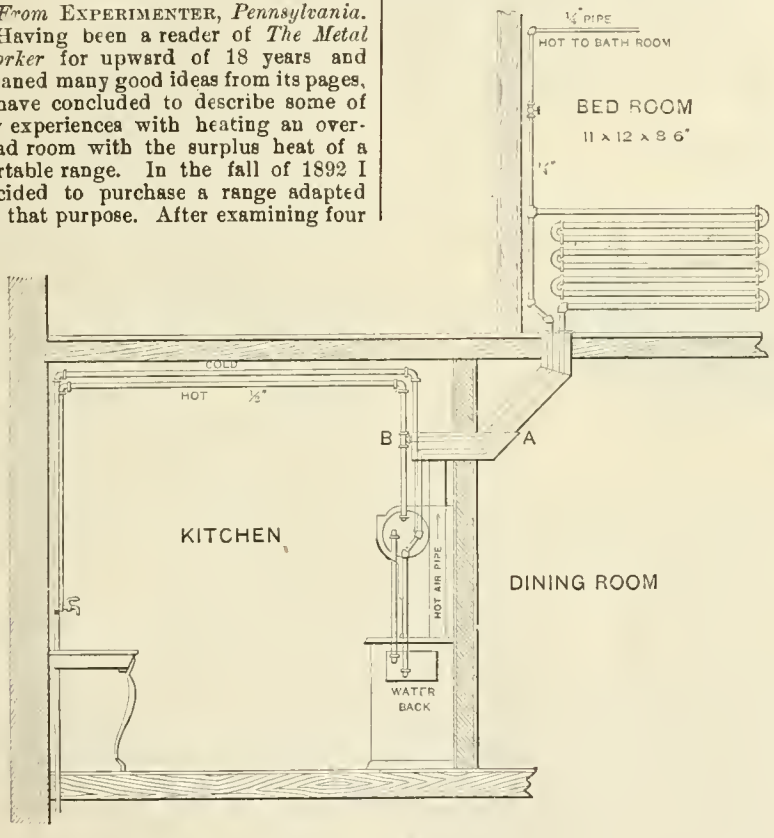
THE LETTER BOX.

Machine or Tool.

From F. A. R., *Brooklyn.*—In reply to the inquiry of "M. J. C.," Elwood, Ind., which appears in *The Metal Worker* of May 12, I consider the term "machine tool" a very wrong name for a lathe. A lathe is as truly a machine as is the brake or stamping machine. Machine tools are tools placed within a lathe, brake or press to perform on whatever work is placed in the machine. If lathes be called tools, what will you call the numerous appliances that do the work placed in a lathe?

Utilizing Surplus Heat.

From EXPERIMENTER, *Pennsylvania.*—Having been a reader of *The Metal Worker* for upward of 18 years and gleaned many good ideas from its pages, I have concluded to describe some of my experiences with heating an overhead room with the surplus heat of a portable range. In the fall of 1892 I decided to purchase a range adapted for that purpose. After examining four different makes, I found it rather difficult to decide which one to select as the most efficient and economical, but finally selected a No. 80 Fidelity range, because the hot air outlet was somewhat larger than that of the others, also because the hot air attachment was an independent feature, placed on the end of a complete range, so that it could not possibly chill the oven, which, it is claimed, is the case with some heating ranges. After placing the range in position and connecting the hot and cold water pipes, I cut a hole through the partition and floor, putting in a 5 x 8¾ inch square pipe, to which I connected the 3½ x 8½ inch oval hot air pipe from range. At A on the sketch a hinged cover (not shown in detail) was placed, which when closed threw the heat upstairs. On opening this cover and closing the damper in square pipe, the hot air was thrown into the dining room. The result was quite gratifying. As the family did not use much hot water and the fire was kept burning briskly at all times, the water in the boiler boiled and at times generated steam. The thought suggested itself that a coil could be placed up stairs, and by leaving the door to back room open assist in keeping it warm. After some search a second hand coil, consisting of 40 feet of 1-inch pipe, was secured. This was rather more pipe than was requisite, but being averse to spending any time on alterations I concluded to risk it. The coil was placed in position and a tee was placed on the cold water pipe from the boiler to the water back, and a pipe with two 45° ells carried high enough to clear the other pipes, thence up through hot air pipe and connected with bottom pipe of coil, which made the return pipe. At B another tee was inserted and carried up alongside of return pipe to top of coil, and connected with a reducer tee to coil. Here a ¼-inch pipe was attached and extended to bathtub, primarily as an air vent, but later developed into a luxury, as a tubful of hot water could be drawn in 15 minutes. On flow and return pipes globe valves were placed to cut off circulation when desired. From the accompanying plan it appears as though the connections were direct; such is, however, not the case. The coil stands parallel with the partition and was drawn thus to obviate the necessity of making another view, and there are eight angles and ells on both flow and return pipes. The result exceeded expectations as far as heating the two rooms was concerned, but in a family where considerable hot water is used it would not prove quite so satisfactory. A coil consisting of the same number of feet of ¾-inch pipe would have been a perfect job. I trust this experiment will be of some service to a brother chip.



Utilizing Surplus Heat.

Fire Place Smokes.

From THE MILLER GRATE COMPANY, *Cleveland, Ohio.*—We notice in *The Metal Worker* of May 12 a communication from "J. A. S," Fairfield, Iowa, in regard to a fire place which smokes. If "J. A. S." will fill the hollow space of back and side to top of lower damper we think he will find the remedy for his smoking fire place.

Open or Closed Soil Pipes?

From M. C H., *Portland, Maine.*—I should like to have the opinions of the readers of *The Metal Worker* on covering soil pipe after it passes through the roof. Should the end be left open or covered with a wire basket or ventilator cap or cowl? It is my opinion that in this section all such devices would be stopped by a sleet storm and frozen up, effectually preventing vetilation. I have not seen any trouble where the end had been left entirely open.

Note.—The regulations in the city of New York require the end of the soil pipe to be protected by a screen. We suppose that the same practice is followed in other cities. It has been said that the open end of a soil pipe has been stopped by birds building nests in it. We shall be glad to have our readers give their opinions.

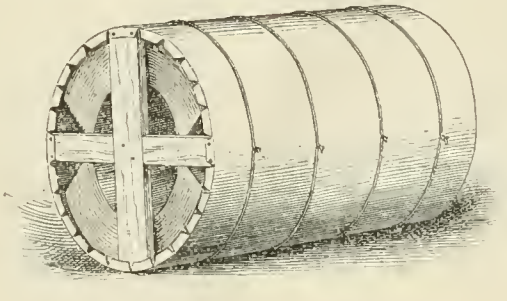
Sorting Information.

From N. G., *Tacoma, Wash.*—Having seen the letter of "C. E. S." in *The Metal Worker* of May 12, I send you my method of sorting information. In our shop all kinds of work is done, roofing, plumbing, steam and hot water heating and furnace work, consequently we need information on all sorts of subjects. I have made it a custom to clip the articles from *The Metal Worker* that are of practical value in our trade, and in order to have all of the clippings referring to one subject in one place I use large envelopes and have them labeled "Kitchen Boilers," "Plumbing," "Roofing," "Steam and Hot Water," "Pumps," "Plumbing Laws," "Furnace Work," "Pattern Cutting," "Tinner," "Gas and Gasfitter," "Stoves," "Chimneys" and "Electricity." After I have read the paper I cut out such articles as have interest to me or which I think will be of future benefit to me on any one of these subjects, and put them in the proper envelope. Then when I want to get some information on pumps or roofing I get the envelopes bearing these titles, and without the labor of searching through a number of

papers to get the right one, I have all the information before me. Each article clipped bears the date of the paper in which it appeared in red ink. I pursue the same course with advertisements and have accumulated an excellent business directory and a valuable collection of illustrations of articles that it would be impossible for any dealer to carry but which are often inquired for.

Proposed Package for Tin Plate.

From A. L. BURTIS, *Lockport, N. Y.*—Has any manufacturer or user of roofing tin any suggestions to offer for an improved package for shipping the plates? The last invoice of 20 x 28 came to hand all broken up, and almost always comes more or less dilapidated. Any one who has ever handled a quantity of it knows it to be a tough job and one to be dreaded. The boxes go by the name of "Bibles" on account of being something to swear by. Why cannot a cylindrical form of package be adopted in which two boxes of 20 x 28 could be packed and rolled about like a barrel? The cylinder may be of sheet iron, and could be used by the tinner for many purposes and might be charged for. We all know that it is a benefit to sheets of tin to be formed, and much of it is so treated to make it smooth. Although taking up a little more space as freight, I think the railroads would not charge much higher rates per hundred. The sketch that I inclose shows a form of package. It is merely a cylinder of sheet iron wrapped around with wire and the ends bent down, the tin plates being bent in half cylinders, leaving a hollow core. Across both ends of the package are strips of wood so placed as to prevent the sheets from slipping out. Very likely one strip would be sufficient, for I do not think the plates would have much tendency to slide out if closely packed. I would like to hear the opinions of readers of *The Metal Worker* on this system of packing tin plates, and would also be glad if some of the American manufacturers would give their ideas.



Proposed Package for Tin Plate.

Wants a Better System.

From A READER, *Brooklyn.*—For the benefit of "W. S. G.," whose inquiry appeared in *The Metal Worker* of May 12, I give my idea of church heating. The hot air should be distributed and discharged into the church from a number of registers placed in the side walls at an elevation on a level with the eaves of the building. Ventilation for the building should be secured by air being drawn into registers placed at the base of the side walls. The capacity of the ventilating registers should be one-half that of the hot air registers. I should be glad to have the readers of *The Metal Worker* give their views upon this idea, as I consider that placing both the heating and ventilating registers on the floor, as shown on the diagram, is virtually connecting them together.

Paper Backed Corrugated Iron.

From CASWELL & MOORE *Phœnixville, N. Y.*—Will some reader of *The Metal Worker* inform us whether any parties now manufacture corrugated iron with a covering of thick paper attached to it on the under side, and if so, where the material can be obtained? A sample was sent us several years ago, but has been mislaid or lost. The paper was pressed into the corrugations and adhered very firmly to the iron. We suppose the lining was for the purpose of preventing condensation or sweating.

By the reduction of the price of city made gas in Philadelphia from $1.50 to $1 per 1000 cubic feet, the receipts for the first four months of this year show a loss of revenue, as compared with the same period of 1893, amounting to $338,004. It is estimated that the city gas bureau realized a profit of $1,000,000 last year, but if the present ratio of consumption keeps up a deficit of about $190,000 will be exhibited at the end of 1894. The report of the chief of the Gas Bureau shows that although the price of gas was reduced 33⅓ per cent., consumption has only increased 18 per cent. This estimate, however, does not take into consideration the fact that the lower price will ultimately stimulate consumption much more. It is not reasonable to look for an immediate increase of any vast proportion, for only gradually will householders use gas more freely. The advantages of gas for heating and cooking will be admitted and the employment of gas stoves and ranges is sure to follow as soon as the price of the fuel renders their use economical.

Coxey's "popular" movement has come to an ignominious period by the consignment of the Commonweal leader and his principal lieutenants to jail in Washington on conviction of the offenses of displaying unlawful banners in the Capitol grounds and trampling on the grass. The whole episode has attracted far more attention than it merited.

The bill, promoted by the New York Academy of Medicine, providing for the establishment of a National Health Bureau has been favorably reported to the House by the Committee on Interstate and Foreign Commerce, and the measure has a good prospect of being passed into law by the present Congress.

A Canadian on American Tin Plate.

The *Canadian Manufacturer* of Toronto prints the following:

A few weeks ago the manager of a Toronto manufacturing concern, who are, perhaps, the largest consumers in Canada of tin plates, expressed a wish to have an opportunity of examining and testing some of the finer qualities of American tin plates. The gentleman to whom this wish was expressed happened to be a personal friend of one of the officers of the New Castle Steel & Tin Plate Company, who are proprietors of extensive tin plate works at New Castle, Pa., and in this way the wish of the Canadian consumer was made known to the American manufacturer. It was then that the New Castle Steel & Tin Plate Company addressed a letter to the Kemp Mfg. Company, Toronto, in which it was stated: "We have this day sent you a box of mixed plates—some ordinary coke, some sheets of a better grade of coke, and some of common charcoal. We would be pleased to have you inspect these plates and submit them to any test that you may require in your work. These are genuine American plates, made from Lake Superior ores, through our blast furnace, steel plant, and finished throughout in our works. We are furnishing these plates to some of the largest consumers in the United States, and thus far they seem to give the best satisfaction, as we have received nothing but praise in regard to the coating and working properties of the steel. . . . We make both a pure palm oil plate and a patent plate. The charcoal plates sent you are a pure palm oil finished plate. The cokes are made on patent machines. We are anxious to have you try our plates, and if at any time you desire high grade plates we would be pleased to quote you prices."

The writer was afforded an opportunity to inspect these American plates and was impressed with the most favorable comparison they bore to similar Welsh plates; and we have been informed by the Kemp Mfg. Company that they have been subjected to precisely the same processes of manufacture in their works as all other plates are, and that they are the equal in all respects of any plates ever used in that factory.

The Technical Education Board of the London County Council, England, are arranging a series of conferences during the coming summer between representatives of the various London industries. The object the board have in view is to elicit from practical artisans useful information as to what kind of trade education is required in each case, in what respects the existing provision is faulty, how it can be improved, and the best steps that can be taken to bring it to the notice of the younger workmen and apprentices.

The woolen carpet which has covered the coiners' room in the San Francisco mint for several years was recently cremated. On refining the ashes the Government recovered 279 ounces of gold, worth $5500.

The Chicago Stamping Company.

Recent additions have been made to the plant of the Chicago Stamping Company, rendering it a very much more complete establishment in every department. The works are now so extensive that they rank among the largest of the kind in the country. They occupy almost an entire city block, bounded by Congress, Green, Harrison and Peoria streets in the west division of the city of Chicago. This is graphically shown by reference to the accompanying diagram giving a ground plan of the works. The only portion of the block not included in the company's plant is the northwest corner.

These works were established by Frank Sturges & Co. in 1865. That firm erected a three-story building 100 by 30 feet on a portion of the present site. From this comparatively small beginning has gradually grown the important enterprise which is the subject of this article. The incorporation of the company dates from 1876. Frank Sturges, the founder of the company, still retains his connection with it, and is at present one of the board of directors. His son, Lee Sturges, became connected with the establishment in February, 1886, and is now president. Under his management the progress of the company has received increased impetus, judicious alterations have been made in the plant and its scope has been very greatly enlarged. W. M. Conger, now vice president and secretary, was the late owner of the Newark Tea Tray Company of Newark, N. J., and first made the manufacture of high grade tea trays a success in this country. He was also the first inventor of machinery for successfully manufacturing stove boards.

The buildings erected on the block above referred to vary in hight from one to four stories. The main building of the factory is at Harrison and Peoria streets and is four stories high. The store building is diagonally opposite, on the corner of Congress and Green streets, and consists of four stories and a basement. The tin shops, stables, machine shops, stamping rooms, &c., occupy the intervening ground and are of irregular hight.

Until last year the company maintained a store on Lake street in the heart of the business section of Chicago, but at that time their new store building was finished and the offices were then removed to and consolidated with the works, greatly improving the shipping facilities, avoiding the frequent handling of goods, and enabling orders to be filled with much greater promptness.

The works may be said to be divided into two grand departments, of which one is devoted to house furnishing goods and the other to specialties, such as cans, grocers' goods, milk cans, milk can trimmings and stock.

The company manufacture their own raw material as far as possible. They have their own tin plate plant, in which they produce a large proportion of the tin plates required for their consumption. This department was started about the beginning of the present year, and now has three automatic tinning machines, to which more will soon be added. Contracts have already been placed for the additional machines, some of which are intended for tinning very large and heavy plates for milk cans. The capacity of the machines now in operation is from 800 to 1000 boxes per week. It is the intention of the company ultimately to not only make all the tin plates required for their own consumption, but also to manufacture for the open market. At present black plates are purchased from outside manufacturers, but the erection of a rolling mill at some convenient point is contemplated, and it would probably have been begun before this time if the question of tariff duties had been favorably settled.

The stamping department contains one of the largest presses in the world. Thus far only two of these large presses have been built. It is of the Stiles & Parker make, takes a 5-foot blank, weighs 65 tons and stands 18 feet high from the floor. It is used for very heavy work, pressing sheets up to the heaviest gauges. Other large drawing presses are in this department, which are used for dish pans and large work, together with a great number of small presses for cutting up tin plates for small ware and drawing all descriptions of small articles and miscellaneous work.

A peculiar feature of this establishment is that all the metal cutting for the works is done in one place, the stock then being distributed to the different departments in which it is finally worked up. In this way the cutting is economically done, insuring a minimum waste of tin plate. The importance of this feature will be realized when it is known that between 3000 and 4000 different articles are constantly in process of manufacture. The machine shop for making all the dies and special machinery is equipped with the latest kinds of planers, drills, lathes, &c. It is a complete die and tool shop, but is run exclusively on the company's own work.

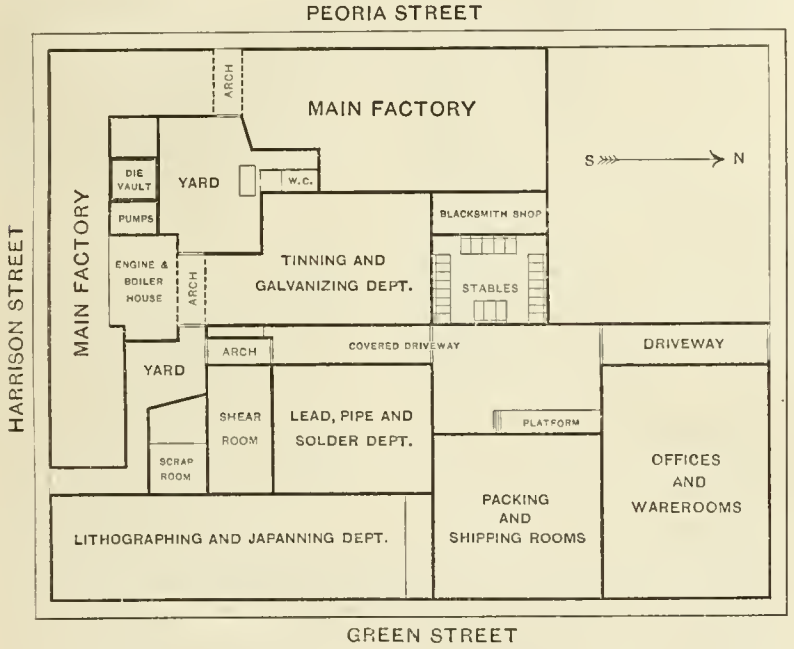
This concern was one of the first in the country to make stamped milk cans, and are now very prominent in the manufacture of milk cans and dairy supplies. They make a very great variety of milk cans, as each section of the country has its own peculiar pattern, and the company's business extends over the entire area. This department, which is under the management of W. H. Burn, formerly secretary of the Buhl Stamping Company of Detroit, is an important branch of the establishment, and is located on the ground floor of the main factory. Here milk cans are manufactured in large quantities for stock, so that the demand for made up cans can be promptly supplied. A large force of hands is also regularly employed in making up trimmings to supply the demand for this class of work.

The second, third and fourth floors of the main factory building are devoted to pieced tinware and can work, such as paint cans and miscellaneous tinware. The tinners' department for sheet iron and galvanized iron work and heavy tin work is also in this part of the establishment.

All stamped ware is retinned in a retinning shop operated in close connection with the tin plate department. It contains a number of stacks, additions to which are being made which will considerably increase its facilities. Retinning requires peculiar skill on the part of the workmen, and consequently the highest priced labor is found in this shop. An important department of the works is the galvanizing shop, which is also operated in connection with the tinning house. Galvanized ware, such as coal hods, buckets, &c., is first made of black iron and is galvanized afterward.

A special department is devoted to the manufacture of lead pipe and solder. It is equipped with the necessary machinery for manufacturing all sizes of lead pipe, from 4 inch down to ¼ inch. Here large quantities of solder are also made for the general trade. It is the intention to make the manufacture of lead pipe and solder more conspicuous hereafter.

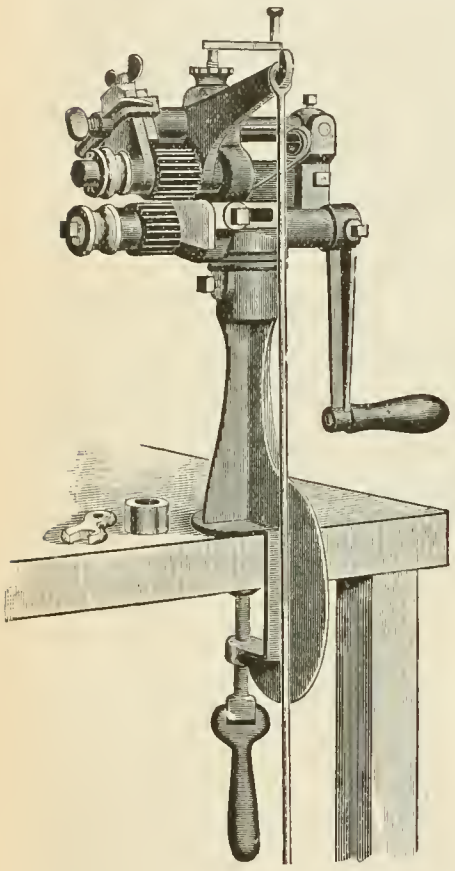
An extensive shop has been fitted up for lithographing tinware and japanned ware, including not only staple articles known to the trade, but a large amount of specialties, such as advertising signs, druggists' boxes, tea caddies, &c. Three power presses are constantly in operation on lithographic work. In close connection with the printing department is the japanning department, in which are a number of large baking ovens heated by steam. The company also have a nickel plating plant, in which they nickel plate all portions of their product requiring such treatment.



PLAN OF THE WORKS OF THE CHICAGO STAMPING COMPANY.

The line of house furnishing goods manufactured by the Chicago Stamping Company covers everything made by establishments of this kind. In addition, they turn out any kind of special work in sheet metal ware; for instance, they have an important trade in agricultural implement seats made of stamped metal, which are being used in place of the old style heavy cast iron seats. The special boxes made for the use of druggists and others are of infinite variety and sizes, some having been turned out as small as a nickel.

The store building has been well arranged for offices and warehouse purposes. The offices on the first floor are handsomely furnished. A portion of the same floor is used for a sample room. The store and sales department are under the management of W. L. Goodrich, who has been actively identified



The New Lightning Pipe Crimper.

with the tinware trade of the West for the last 25 years. The upper floors of this building are devoted to storage purposes, carrying at all times a full stock of kitchen and house furnishing goods. The company's trade covers the whole country from the Atlantic to the Pacific oceans and to the extreme South. They have built up a large Eastern as well as a Western trade. To meet the requirements of such a business and to hold the trade by prompt shipments, it is essential that very large stocks of goods should be constantly carried. Heretofore they have done a large jobbing business in connection with their business as manufacturers, but the rapid growth of their factory trade has now compelled them to discontinue the handling of outside goods and they will confine their attention almost exclusively to their own products.

The committee appointed by Secretary of the Navy Herbert to investigate the charges made against the Carnegie Steel Company, Limited, of furnishing the Government with defective armor plate finished their labors last week and have returned to Washington. It is given out that the proceedings of the sessions will not be made public, but will be incorporated in a report to be made to Secretary Herbert.

The New Lightning Pipe Crimper.

The New Lightning pipe crimper herewith represented is a machine brought out by the inventor, W. A. Wheeler of the Indianapolis Elbow Company, Indianapolis, Ind. This crimper is designed for general use in tin shops, as well as for factories where large quantities of stove pipe are made; rapidity of action and uniformity of work produced being the objects sought to be attained. A leading feature of the new crimper is the manner in which the rolls are brought to bear upon the work. This is accomplished, preferably, by means of a treadle connected with a lever, which, with the arrangement of the parts, gives to the upper rolls a swinging motion and brings them to bear upon the work with a toggle joint movement, thus holding it very rigidly with little or no pressure on the treadle, as the forward movement of the crank in drawing the work through serves to hold the rolls down, relieving the operator of any special effort as to this part of the work. As a matter of fact, if the foot be removed from the treadle after starting the work in it goes through all the same. A slight backward movement of the crank instantly releases the work. This toggle movement, it is pointed out, also acts as a safeguard against any slighting of work by a careless hand, as the depth of crimp does not depend upon the treadle pressure, being regulated entirely by the crank screw at top, which is secured from working loose by means of a lock nut. If desired, this machine may be closed and opened by means of the screw, the change being effected in an instant and without in any manner impairing its efficiency. To effect this the lever is brought down as far as possible and then a pin (not shown in cut) is pushed in which prevents the rolls from swinging, but allows them to rise and fall vertically with the movement of the screw. This feature will be appreciated where odd jobs are to be done, but for turning out work in quantities the treadle will be found preferable. The upper swedging roll is attached to a separate head block which is secured to the swinging frame by means of a clamp made fast by a thumb screw, as shown in the cut. Another thumb screw above this head block furnishes means for adjusting the swedge to different depths without affecting the crimp. The head block is readily removed by loosening the clamp and slipping it off when it is desired to leave the swedge off the work; or the same result may be accomplished quicker by pulling out the spring pin that holds the roll on and then slipping it off. The rolls are made of the best cast steel and hardened and are machine finished all over. They can be interchanged when worn out at one end. A new pattern of screw clamp stand is furnished with each machine, which is both light and strong.

One of the results of the soft coal strike is that the largest fleet of idle vessels ever seen on the Delaware now floats there awaiting the termination of the trouble—and cargoes.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

THE W. H. KEELER COMPANY have secured the plumbing and tinning contract on a six-tenement house on South Elm street, Waterbury, Conn.

JOHN J. RULOFFS & BRO. received the contract for the plumbing work and E. P. Bates of Syracuse the contract for the steam heating in the city building at Albany, N. Y.

THE BOARD OF EDUCATION of Minneapolis have awarded the contract for the new Douglas School building to Eric Lunn for $29,295. This does not include the cost of heating and ventilating plant or the system of plumbing for the school, which will be contracted for later.

A SPECIAL COMMITTEE, composed of Messrs. Ulrich, Brady and Holthaus, has been appointed by the School Board of St. Louis to take charge of the repairs and changes to be made to the heating apparatus in the schools, which has been estimated to cost nearly $40,000, and which will include substituting hot air furnaces for stoves and steam heaters for furnaces, according to the schools. In many of the schools simple repairs are required.

THE COUNCIL of La Crosse, Wis., have authorized the Board of Public Works to advertise for bids for a heating plant for the Logan Street School.

H. E. BOTTUM has been awarded the contract for the plumbing in the new *Republican* Building, at Cohoes, N. Y.

AMONG the contracts recently taken by the Baker & Smith Company, 193 to 197 Van Buren street, Chicago, can be mentioned the following: Hot water heating plant in the residence of Gen. C. W. Drew, Calumet avenue, and steam heating plant in the residence of David B. Jones, Lake Forest, Ill.

THE WELLS & NEWTON COMPANY, 274 Dearborn street, Chicago, do the plumbing, sewerage and gas fitting in the flat building of J. L. Wells, 425 Marshfield avenue.

THE WALCOTT-HURLBUT COMPANY, 175 Lake street, Chicago, are to furnish two sections of their Eduction siphon closet range for the United States Indian School at Phœnix, Ariz., and two sections for the Meriden Britannia Company, Meriden, Conn.

THE THEO. JACOBS COMPANY, 72 and 74 Market street, Chicago, are to furnish the steam heating plants for the residence of Leon Mandel, Michigan avenue and Thirty-fourth street, and for the C. & N. W. R. R. depot at Marshalltown, Iowa.

YARRINGTON & MCCABE have the contract for the plumbing at the power house of the Derby Street Railroad Company, at Derby, Conn., and have commenced to put in the waste pipes.

THE BOARD OF EDUCATION OF SOMERVILLE, N. J., have authorized the architect of the new school building to advertise for bids for the heating and ventilation of the school. The building will also have a complete system of plumbing.

GEORGE B. COBB & CO., 96 Centre street, New York, are engaged in installing Florida boilers in the residence of George L Aiken, Rahway, N. J.; G. E. Corry, Bensonhurst, L. I.; F. G. B.

Brown, Keyport, N. J., and H. L. Ward, Tottenville, Staten Island.

Architect James A. Hiscox is making plans for the addition and sanitary improvements to the Roath Avenue School, Norwich, Conn.

A plumbing contract amounting to $45,000 for Cornelius Vanderbilt's summer residence called The Breakers, at Newport, R. I., was awarded to William Lumb & Co., of Boston, Mass.

The Council Committee on the new industrial school at Newport, R. I., have adopted specifications for the plumbing of the new building and have authorized the architect to ask for bids for the steam heating from local steam fitters.

Traynor & Co., Wilmington, Del., have the contract for installing the steam heating plant in the St. Joseph Home of Colored Missions of that city. There are five buildings, including a church, priests' house, sisters' house, the orphanage and a general utility building. Two heavy duty Florida boilers will be used and 7400 feet of the American Radiator Company's radiators. The steam main in starting from the plant is 8 inches in diameter, and it is 390 feet from the boiler to the extreme end of the main, the entire circuit being nearly 800 feet.

The Wells & Newton Company of New York City are engaged in installing the steam heating plant in the addition to the Drew Seminary, at Madison, N. J., where they are using Joy radiators. They are also commencing the installation of the heating plant in St. Luke's Hospital, New York City.

The Smith & Anthony Company of Boston, Mass., will furnish the heating and ventilating apparatus for the new school building at Burlington, Vt., which will be installed by the G. S. Blodgett Company of that city.

Charles R. Watkins, clerk of the Board of Supervisors of Watkins, N. Y., will receive sealed proposals up to June 2 for the steam heating plant of the county building and the plumbing for the court house at that city.

The contract for furnishing the hot water heating system for the county house has been awarded Sullivan & Haynes, Middleburg, N. Y., for $1302.50.

J. S. Brazelton of the firm of J. S. Brazelton & Co., plumbers, Waco, Texas, has been in Belton taking the measurements for the plumbing work in the new hotel that is in course of construction at that place.

The Iowa Construction & Mfg. Company of Sioux City, Iowa, were awarded the contract for furnishing and placing the heating and ventilating apparatus, including elevator power, for the public building in course of construction at Paris, Texas. The amount of the contract is $5500.

E. T. Weymouth, Brooklyn, has recently completed the installation of a steam heating plant in the residence of A. E. Schwartzman of *Puck*, at Nostrand and St. Mark's avenues, Brooklyn, N. Y., using a No. 30 All Right steam boiler.

The S. Wilks Mfg. Company, 113 to 123 Clinton street, Chicago, are to furnish large sized Wilks hot water heaters and tanks for the Indian Agency at Standing Rock, N. Dak.; residence of James W. Willard, Waterbury, Conn.; G. N. Buffington Bath House, Buffington, Ky., and residence of A. W. Green, 4935 Greenwood avenue, Chicago. The company have received a large number of orders for small heaters from various parts of the country, and report business to be in a flourishing condition.

Meisel, Stickney & Co., 43 College place, New York, are installing five All Right steam boilers in the buildings being erected by Jenkins Brothers at 121st street and Eighth avenue.

SCRAP.

The works of the Cynon Tin Plate Company, Aberdare, have been lately added to the lengthening list of closed Welsh tin plate establishments.

Notwithstanding the continued stoppage of a large proportion of the Welsh tin plate works, owing to the refusal of the workmen to make more than 36 boxes per shift, the production of tin plates is reported as being still far in excess of shipments, which have reached a very low figure.

Kahn Bros'. tin plate plant, at 525 East Nineteenth street, New York City, is quite busy turning out the firm's brands of American terne plates to fill orders. Messrs. Kahn report a very active demand for roofing plates at the present time, the domestic product being in special request. For a while the operations of the firm were somewhat hampered, owing to the difficulty of obtaining a sufficient supply of American black sheets, which they use exclusively, but this impediment has been overcome.

Last week executions amounting to $8477 were issued against the McKinley Tin Plate Company of Wilkinsburg, Pa. The concern were chartered on June 8, 1892, with a capital stock of $50,000. The charter members of the company are: L. H. Smith, 240 shares; E S. Wangenheim, 240 shares; H. Y. Haus, 2 shares; S. W. Cunningham, 2 shares; Richard B. Scandritt. 2 shares. Since the organization some Pittsburgh parties have also taken stock. The firm have not as yet made an assignment, but judgment has been confessed to E S. Wangenheim, one of the largest stockholders, in order to protect the company and their creditors. The assets are placed at $15.000 and the liabilities at about the same amount.

The tin plate department now under erection by the Ætna Standard Iron & Steel Company, Bridgeport, Ohio, is expected to be ready for operation about June 1 next.

Two new tin plate manufacturing companies were registered in England lately — namely, the Earlswood Tin Plate Company, Limited, with a capital of $60,000, and the Foxhole Tin Plate Company, Limited, with $100,000 capital, both of Llansamlet, Glamorganshire, Wales. Commenting on this circumstance, the *Iron and Steel Trades Journal* of London says, editorially: "For the moment there is no inducement for any one to invest in tin plate works, but there is a good time coming, and the Welshmen are getting ready for this."

The citizens of Anderson, Ind., are reported as endeavoring to arrange for the location there of a rolling mill to manufacture black plates for tinning.

The Emlyn Steel & Tin Plate Company, Summitville, Ind., are reported to be progressing satisfactorily with the buildings for their tin plate plant, which will, when complete, have a capacity of 150,000 boxes annually.

The New Castle Steel & Tin Plate Company, New Castle, Pa., have contracted with Maris & Beekley of Philadelphia for the supply of a 4 ton traveling crane and two 2-ton trolleys.

The Leechburg Foundry & Machine Company, Leechburg, Pa., have made the first shipment of tin plate machinery to the Ætna Standard Iron & Steel Company, Bridgeport, Ohio, consisting of cold rolling mills, hot rolls, shear, pickling machine, &c.

An attractive little advertising novelty is being distributed by the well-known tin plate house of Merchant & Co., Incorporated, of Philadelphia, New York, Chicago and Brooklyn. It takes the form of a folded card, bearing a faithful resemblance to a miniature box of their famous brand of terne plates—Merchant's Roofing—with all the proper markings of the original. On opening the card an excellent representation of a silvery roofing plate is seen reposing within the box, having a *fac simile* of the firm's registered brand stamped on its face.

One of the youngest on the list of American tin plate works is that of George W. Jaques, Thirteenth avenue and Twentieth street, New York City. Two tinning stacks constitute the present equipment, but these are likely to be added to before long, as they have been kept actively engaged to their full capacity ever since starting two months ago. Mr. Jaques uses American black sheets exclusively, and his product has met with so favorable a reception among the local trade that he has received orders for all of his output for some time to come. "New Process" roofing plates are his specialty at present. Mr. Jaques was for a long period connected with the old established tin plate and metal firm of A. A. Thomson & Co. of this city, and is well known by the tin plate trade.

The Tin Plate Duty.

On Thursday, in the Senate debate on the Tariff bill, the amendment reported by the Finance Committee reducing the duty on tin plates from 1⅛ cents a pound (as arranged in the House bill) to 1 cent a pound was withdrawn, leaving the House rate standing. Senator Aldrich of Rhode Island moved an amendment to make the rate 1⅛ cents a pound, and was supported by Senators Platt and Allison, the latter arguing that the reduction of the duty on tin plates involved a breach of fai h toward those manufacturers who, under the inducements offered by the McKinley bill, had established a successful and promising native industry. Works, he said, had been erected, with a capitalization of nearly $6,000,000, producing 100,000,000 pounds of tin plates per year, and which would have been now producing double that amount were it not for apprehension caused by tariff agitation. The reduction of duty, he asserted, would give a severe blow to the nascent industry. After a lively discussion the amendment of Senator Aldrich was defeated, and the paragraph fixing the duty at 1⅛ cents per pound was agreed to.

The Pittsburgh Fuel Company are reported to have contracted for mining machines to operate their coal pits as a result of the miners' strike.

ROOFING AND CORNICE.

The Country Cornice Shop.

IX.

BY CORNICE WORKER.

Leader Hooks and Coverings.

In Fig. 85 is shown a hook which is used for fastening plain leader to a wall, the blows being struck against A when driving the hook in place.

sition against the wall and then the hook driven over it.

Let us suppose that a straight plain leader is to be put up, having no bends whatever, and that hinged hooks as shown in Fig. 86 are to be used. After having marked the position where the leader is to be placed, drive the first top hook as far as the leader is to project from the wall. Now drop a chalk line with a weight attached at the bot-

removed and the new one put in place. The hinges would then be closed and fastened with new wire.

Fig. 87 represents a hinged hook for corrugated leader; the same method being employed to fasten the hook and leader as explained for that shown in Fig. 86. In Fig. 88 is represented a wall hook used for a square leader, the same as would be employed to fasten such a leader as that shown in Fig. 91.

Fig. 85.—Plain Leader Hook.

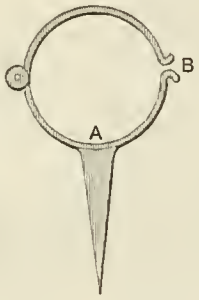


Fig. 86.—Plain Hinged Leader Hook.

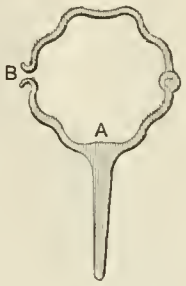

Fig. 87.—Corrugated Hinged Leader Hook.

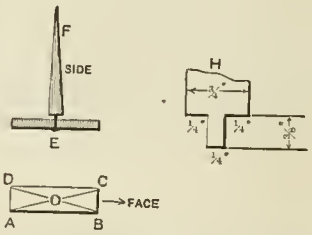

Fig. 90.—Side and Face Views of a Home Made Leader Hook.

Fig. 88. — Wall Hook for a Square Leader.

Fig. 89.—Wall Hook for an Octagon Leader.

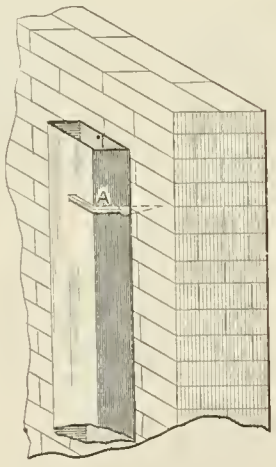

Fig. 91.—Square Pipe Fastened Against a Wall with Hook Shown in Fig. 88.

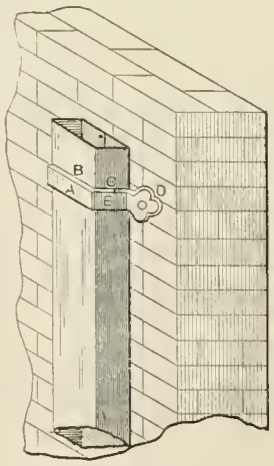

Fig. 92.—Method of Covering the Hook with Metal.

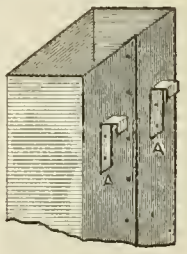

Fig. 93.—Method of Soldering or Riveting the Angles on Leaders.

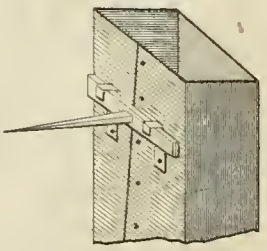

Fig. 94.—Angles Resting on the Hook Shown in Fig. 90.

THE COUNTRY CORNICE SHOP.—ILLUSTRATING LEADER HOOKS AND COVERINGS.

Fig. 86 represents a hinged leader hook, used for putting up plain leaders when it is desired that the leader stand off from the wall, so that in case of an overflow or the leader bursts the wall will not be injured.

When driving the hook into the wall it is opened and the blow struck against that portion indicated by A of Fig. 86.

In using hinged leader hooks they must first be driven into the wall before the leader can be placed in its proper position; but in using the hook shown in Fig. 85 the leader is first placed in po-

tom so as to keep it stretched, fastening the line to the center of the hook A shown in Fig. 86. Now drive as many hooks as are required, being careful that the chalk line meets the center A of the hook, Fig. 86. The leader is now placed in the hooks, the hinges closed and fastened with wire at B, using a pair of plyers with which to twist the wire. By using hinged hooks a great amount of time and labor is saved in case of repairing, or if a new leader was required the wire and hinge would simply be opened, the old leader

In Fig. 89 is represented a wall hook for fastening an octagon leader in the same manner as shown in Fig. 91. The hooks indicated in Figs. 85, 86, 87, 88 and 89 can be purchased from dealers in tinners' supplies, from whom catalogues can probably be obtained upon application.

In Fig. 90 is shown the side and face view of a home made leader hook; A, B, C, D representing the face view, E, F the side view, and H the measurements from which to cut the wedge F, so as to rivet on to the face as shown at

E. The face or front of the hook, A, B, C, D, Fig. 90, is made from a piece of $\frac{3}{16}$ x 1 inch band iron, making the length of A B or C D, Fig. 90, in length equal to the width of the square or octagon leader, which is to lay against the hook, as shown in Fig. 94.

After the piece of band iron is cut to the required length, draw two diagonal lines through the same, as shown from A to C and B to D in Fig. 90, the intersection being shown at O. This indicates the center where the $\frac{1}{4}$-inch hole is to be punched, in which to place and rivet the wedge, as shown at E, Fig. 90. The wedge F, Fig. 90, can be made from $\frac{1}{4}$ x $\frac{3}{4}$ inch band iron. Heat the end F in the forge to almost a white heat, and then with quick successive blows with the hammer, stretch it to almost a point, wedge shape, as shown. Three inches of the wedge driven into the wall will be sufficient to uphold the leader. Now if the leader is to project 2 inches over the wall line, and 3 inches are required to drive into the wall, then the wedge must be cut 5 inches in length. The rivet end of the wedge, shown at E, Fig. 90, is cut and filed as shown at H, Fig. 90, the full size measurements being given.

The $\frac{1}{4}$ x $\frac{3}{8}$ inch rivet shown at H must be filed perfectly round so as to fit the $\frac{1}{4}$-inch round hole punched in the face of the hook, shown at O, Fig. 90, and to which it will be riveted as shown at E, Fig. 90. After it is riveted the rivet head E should not project over the face of the hook any more than $\frac{1}{8}$-inch, so that the leader will lay well against it. In driving the hooks into the wall care must be taken that they are all on a plumb line, using the chalk line as before explained, and that each hook has the same projection over the wall as the other, otherwise the leader will not lay tight against the hooks.

In Fig. 91 is shown a perspective view of a square pipe, or leader, fastened against a wall by means of the hook shown in Fig. 88. It will be noticed that the riveted side of the square leader shown in Fig. 91 lays tight against the wall and that the hook A of the figure corresponds to the hook A of Fig. 88, and is driven into the joint of the brick work as shown in Fig. 91. If the hook was left in this position it would make a bad appearance; to overcome which a galvanized sheet metal covering is placed over the hook, using galvanized iron for a galvanized iron leader and copper covering for a copper leader. The appearance is shown at A in Fig. 92. The covering A in Fig. 92 is slipped over the hook shown at A in Fig. 91 and soldered along the top of the covering and against the leader, as shown at B and C, Fig. 92, thus making a clean and neat appearance.

In Fig. 93 is a perspective view of a square leader, showing the method of soldering or riveting to the leader the angles for fastening the pipe or leader which is used in connection with the home made leader hook in Fig. 90. These angles can be made about $1\frac{1}{2}$ inches wide and so long that two rivets can be riveted through the leader and angle with ease. If it is not convenient to rivet the angles they can be well soaked with solder, which also gives a good hold. The hooks on these angles should be made a little larger than the size of the face of the leader hook shown in Fig. 90, which is $\frac{3}{16}$ x 1 inch in size. When making the angles use about No. 14 gauge iron. In Fig. 94 is shown a perspective view of the leader and angle resting or hanging on the hook after the latter has been driven into the wall. These hooks can also be used for round leaders of any size by simply bending the face of the hook shown in Fig. 90 to the required circle. It is usual to place these hooks about 8 feet apart, being careful about having them on a plumb line, as before explained, and then taking a long wooden rod about $1\frac{1}{2}$ x $1\frac{1}{2}$ inches by 15 to 18 feet in length and laying it against the hooks driven in the wall, mark off the hooks on the rod, then transferring these distances to the leader, solder or rivet on the angles shown in Figs. 93 and 94. In putting up leaders with the use of these home made hooks a little more time may be required, but when the job is completed the leader gives a neat appearance because no hooks or bands are exposed to view. In putting up any kind of leaders or hooks the latter are generally driven into the wall by reaching out of the windows. Sometimes the leader is placed where the windows are too far distant and then a sitting scaffold must be used, a device which will be found very convenient when executing such a job.

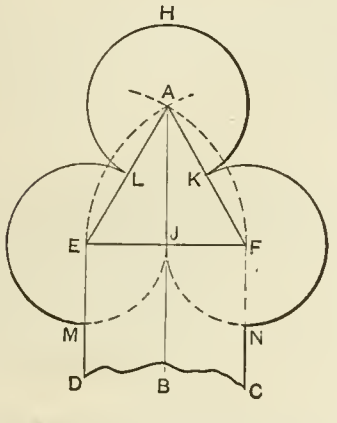

Fig. 95.—Method of Obtaining the Geometrical Figure or Leaf Shown at D in Fig. 92.

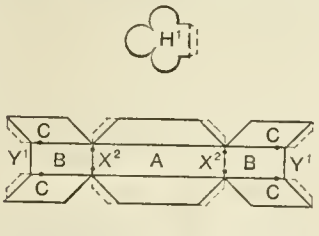

Fig. 93.—Joining in One Piece the Pattern for Front and Sides of Covering; also Pattern for Leaf.

Patterns for Coverings.

In Fig. 95 is shown the method of obtaining the geometrical figure or leaf for the sheet metal covering as indicated at D, Fig. 92. To obtain the leaf proceed as follows: Draw any perpendicular line, as A B, Fig. 95, upon either side of which place the half distance of the width the covering A, Fig. 92, is to have, as shown by the line E F, drawn at right angles to A B, in Fig. 95. Now upon this line construct an equilateral triangle, or a triangle having three sides equal. With F, Fig. 95, as center and F E as radius strike and arc as shown from E to A; then with E as center and E F as radius strike another arc, intersecting the first one at A. Now draw a line from A to E and from A to F; then will A E F represent the triangle desired. It will be noticed that the line A B, Fig. 95, bisects the line E F at J. Now with F as the center point for the compass and with F J as radius strike an arc, cutting the line A F at K; then with A as center and with the same radius strike another arc, cutting the line A E at L. Then again with E as center and using the same radius strike an arc from the point L, meeting the point J on the line E F. Now at right angles to E F, or parallel to A B, drop lines as shown from E to D and F to C. The distance N to C, or M to D, can be made to the width desired, as indicated at A, front view, Fig. 96. Then will C N H M D represent the leaf desired. It should be understood that the width of the covering shown from E to F in Fig. 95 gives the basis for obtaining the center point from

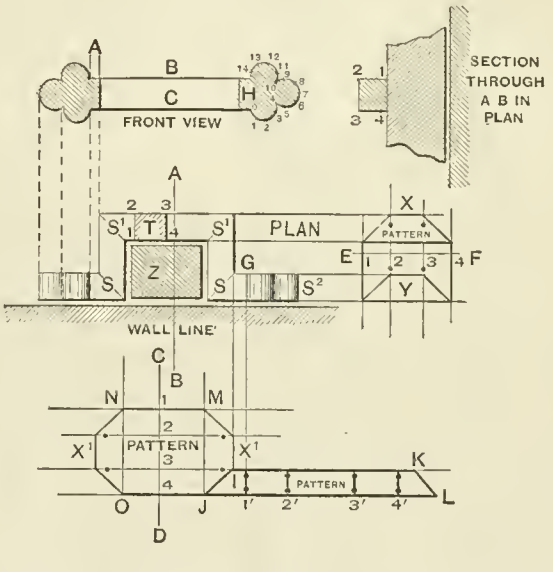

Fig. 96.—Front, Plan and Sectional Views of Hook Covering; also the Patterns.

which to strike the arcs, and therefore makes the leaf in proportion to the width of the covering.

In Fig. 96 is shown the front, plan and sectional views of a hook covering, including the patterns. Let Z in plan represent the size of the leader used, laying against the wall, as shown, around which is placed the plan view of the covering. The width of the front view of covering shown from B to C should be made from 1 to 1½ inches, according to the size of the pipe used: while the width shown from 1 to 2 or 3 to 4 in plan, or what is the same, the width from 1 to 2 or 3 to 4 in the section, should be made a little wider than the width of the hooks shown at A, Fig. 88, or A, Fig. 89, so that the covering will slip over easily. After having the front and plan views drawn in their proper position to each other, as shown by the dotted lines, draw a section of the covering in the plan, as shown at T, from which to obtain the stretchout. S, S', S', S represent the four miter lines in plan. To obtain the patterns for the coverings proceed as follows: At right angles to the line S' S' in plan, draw the stretchout C D, as shown, upon which place the stretchout of the section T in plan, as shown by the small figures 1, 2, 3 and 4, corresponding in number to those on the section. Now at right angles to the stretchout C D draw lines indefinitely through the small figures, as shown, which intersect with lines of corresponding numbers drawn from the miter lines S' and S', parallel to C D. A line traced through these intersections will be the required pattern for the front of the covering shown at A, Fig. 92. For the pattern of the side of the covering, shown at E, Fig. 92, proceed as follows: Parallel with the line S' S', Fig. 96, draw the stretchout E F, upon which place the stretchout of the section T of the plan view, as shown by the small figures 1, 2, 3 and 4 on the stretchout line E F. At right angles to the stretchout draw lines indefinitely through the small numbers, as shown, which intersect with lines drawn at right angles to the line S' S, from the miter lines S' and S. A line drawn through these intersections will be the required pattern for the two sides of the covering, as shown at E in Fig. 92. The pattern for the front and sides of the covering can be made in one piece if desired. In Fig. 97 let A represent a duplicate of the pattern of the front, as shown by M N O J, Fig. 96, and B B, in Fig. 97, represent duplicates of the pattern of the side shown by X E Y F, Fig. 96. It will be noticed that X of the pattern for the side in Fig. 96 joins X' and X' on either side of the pattern for the front in Fig. 96, the joining being shown at X^2 X^2, Fig. 97. Then will B A B, Fig. 97, be the desired pattern for the front and two sides of the covering. Laps are allowed as shown by the dotted lines in Fig. 97. For the pattern of the strip which bounds the leaf H, front view, Fig. 96, proceed as follows: At right angles to C D of the pattern, Fig. 96, draw the lines 3 and 4 indefinitely to the right, as shown by 3 K and 4 L. It should be understood that the width 3 4 of the pattern on the line C D, Fig. 96, is the same as the width 3 4 of the section, and is the width of the strip which bounds the figure H in front view, as shown by S S^2 in plan view. From the bend G in plan view, which corresponds to the angle 1 and 14 of the leaf H in front view, drop a perpendicular line cutting the lines I K and J L, as shown at 1' of the pattern. Now space the leaf H, front view, Fig. 96, into an equal number of parts, as shown by the small figures from 0 to 14; transfer the spaces with the dividers from 0 to 4, front view, on the lines I K and J L, from 1' to 2'. Now transfer the spaces from 4 to 10, front view, to the pattern, as shown from 2' to 3'; then again transfer the spaces from 10 to 14, front view, to the pattern, as shown from 3' to 4'. Now place a duplicate of the miter 1' J I, Fig. 96, as shown, at 4', L and K, which completes the pattern. Then will I J L K, be the pattern for the strip bounding the leaf H, front view, Fig. 96. The miter I J will be cut away from the pattern of the front, as shown. The leaf H', shown in Fig. 97, is a duplicate of the leaf H, front view, Fig. 96. A lap is allowed at H', Fig. 97, which is bent at right angles and soldered to Y' Y', Fig. 97.

Bending the Covering.

If a bar folder is at hand, the pattern shown in Fig. 97 could be bent upon the two lines C C and C C, after which the cross bends could be bent by hand as shown by X^2 X^2, Fig 97, and soldered to their required angles. If a folder is not at hand the pattern B A B, including the leaf H', Fig. 97, and the strip for the leaf shown by I J L K in Fig. 96, could be bent upon the hatchet stake previously shown in Fig. 6.

FLASHINGS.

A FRENCH CONSUL in Burmah, in a recent report to his Government, states that galvanized iron is coming into use in the buildings of the country to a marked extent. Only a few years ago, he says, all the native houses, rich and poor alike, were built entirely of wood and roofed in with grass or leaves. The low price at which iron can be had nowadays has encouraged the Burmese to use it more and more in the construction of their shops, barns, or outhouses. Thus galvanized and corrugated sheet iron is now in general use for roofing purposes, while nails and metal bolts are being substituted for wooden pegs and plugs. These goods are consequently in steady and growing demand.

RHODES, DICKELMAN & Co., Forest, Ohio, report that they are meeting with far greater success with their new eave trough and hangers than their most sanguine expectations, having within the past 90 days established agencies very broadly, and at the present time have in addition placed their goods in over 15 States with the largest jobbing houses, who speak of their merits in the highest terms.

JOHN LE SAUVAGE has recently moved to 37 Duane street, New York, where he has fitted up a shop and is prepared to do all sorts of tin, copper and sheet iron work. He makes a specialty of remedying defective flues, a character of work with which he has had a large experience that has brought him a number of recommendations.

Frank Steele, Charles Gifford and George W. Nelson of Oriskany, N. Y., discovered a few days since in the Mohawk River, opposite the old Oriskany battle ground, two solid round cannon balls in about 3 feet of water, imbedded in the clay. The balls weighed originally 30 pounds, as they weigh 29¾ now. The portion imbedded in the clay is in an almost perfect state of preservation, while about one-third of the surface is considerably corroded by the action of the water. It is calculated that the balls had been there over 117 years, as the battle was fought August 7, 1777.

Trade Notes.

MANY OF OUR READERS and all of our advertisers will be interested in the announcement elsewhere in this issue of A. Mugford, Hartford, Conn., who is a well-known engraver and electrotyper. He makes a specialty of doing work for the heating trades, and as the brief list of references in his advertisement shows, does work for many large and well-known concerns. He has had long experience in designing and engraving advertising matter especially adapted to the trades represented by *The Metal Worker*.

THE TINNERS' MACHINERY & SUPPLY COMPANY, 9 Cliff street, New York, issue a card giving net price-list of Skylight Gearing, a stock of which they carry on hand ready for shipping. On the back of the card are illustrations of the different parts of the Gearing.

TIN ELBOWS AND ANGLES are advertised in this issue by the Excelsior Steel Furnace Company, 38 West Monroe street, Chicago. They make three and four piece Elbows and Angles of 22½° and 45°, in any size from 7 to 20 inches. Those who have not yet used the company's goods can save $1 on their first order for $10 worth or more by cutting out the coupon which appears as part of the advertisement.

THE ADVERTISEMENT elsewhere of the Griswold Mfg. Company, Erie, Pa., directs attention to the Erie Aluminum Ware of their manufacture. The various advantages of this ware are pointed out and particular attention is directed to the Erie Aluminum Kettle, made from cast metal and used for preserving. Fruit acids will not affect it and it is noted in addition that there is no enamel to flake off or plating to wear.

THE DONOHUE PATENT SOLDERING COPPER HANDLE is the subject of an announcement of the Cleveland Rule & Handle Company of Cleveland, Ohio. An illustration of the Handle is shown and general description presented; also a list of firms handling it.

GEORGE BROTHERS, agents for Acorn stoves and ranges at Chaumont, N. Y., report having received the first premium on their display of Ranges at the Watertown, N. Y., fair held recently.

THE ANNUAL MEETING of the John Torrey Mfg. Company was held at the office in Portsmouth, N. H., May 14, and the old officers re-elected. The business of the past year was reported as satisfactory and the sale of Stovene, a paste stove polish, which is the leading specialty of the company, now extends to every State and Territory in the Union. Besides Stovene a paste shoe blacking and a liquid dressing for shoes are manufactured. During the past year the company have removed their plant from South Newmarket, N. H., to Portsmouth, N. H., where they occupy a large factory and have at their command every appliance for the production of the articles above named.

THE STANDARD RADIATOR COMPANY, Buffalo, N. Y., and 167 to 169 Lake street, Chicago, have received orders for over 25,000 feet of radiation from the Modern Heating Company, American Heating Company, Boyce & Co., and Ring & Reardon, St. Louis.

PLUMBING and GAS FITTING.

Plumbers' Convention Delegates.

The master plumbers' associations all through the country are electing delegates to the Twelfth Annual Convention of the National Association of Master Plumbers to be held at Detroit June 19-21. The delegates that will be sent from Pittsburgh were given in *The Metal Worker* May 5; from Rochester, N. Y., and New York City May 12; from Texas, Massachusetts, Baltimore and Philadelphia May 19. Some of the other States and cities will be represented, as follows:

BOSTON, MASS.

J. Warren French, J. W. Cosden, David Smith, J F. Davlin, Dan'l Shannon, T. E. Sharp, P. H. Winn, E C. Kelly, D. G. Finnerty, J. C. McCool, T. J. Hartnett, Isaac Riley, H. H. Collins, Wm. A. Tucker, Jno. Crawford, Jno. C. Boyd.

NEWARK, N. J.

Elias Berla, Alex. Donn.

ST. LOUIS, MO.

P. Madden, Wm. Mortimer, E. J. Lonergan, E. P. Reardon, Jas. McCartin, John McMahon, Ed. Schceneman, A. J. Gallagher, J. C. Mitchell, D. J. Collins, Jeremiah Sheehan, Jas. Kelly, John Shelly, Wm. F. Stein, J. M. Life, Ed. Gardner, C. H. Carroll, Ed. Zausch.

NEW HAMPSHIRE.

F. Lane, Manchester; E. Lessard, Manchester; P. Clifford, Concord.

NEW YORK STATE ASSOCIATION.

W. J. McDermott, Chas. Geiger, J. A. Rossman.

RHODE ISLAND.

D. L. Fales, Pawtucket; Samuel Jackson, Pawtucket; Joseph Haire, J. Cremin, Newport.

WASHINGTON, D. C.

Jos. R. Quinter, Edw. J. Hannan, Jas. Ragan, Dan'l Hannan, Jas. Nolan, Jas. Cunningham.

TOLEDO, OHIO.

Jno. A. Waite, Jno. E. Shultz, Jno. P. Lawrence, Robt. Raitz.

BRIDGEPORT, CONN.

Thomss Logan, president; L. H. Mills, H. B. Middlebrook, James Cook and Geo. E. Schofield, alternates.

WILMINGTON, DEL.

James F. Traynor and Alfred Gawthrop.

IOWA STATE ASSOCIATION.

J. A. Harris, Sioux City; J. E. Allen, Des Moines; J. Burnside, Des Moines.

MILWAUKEE, WIS.

Chas. Polacheck, W. E. Goodman, Ferd. Wittig, W. H. Halsey, A. R. Schwind, Ed. Grassler, L. H. Plum.

CONNECTICUT STATE ASSOCIATION.

Jas. Ahern, Hartford; S. E. Dibble, New Haven; J. Donovan, Middletown.

KANSAS STATE ASSOCIATION.

John Shinn, Topeka; Philip Bertrand, Wichita; James Foley, Leavenworth, and C. J. Prescott, Topeka.

Trade School of the North End Union, Boston.

The directors of the North End Union, a beneficent institution established in the city of Boston for the benefit of the less favored classes of the community, recognizing the value and importance of a definite trade training for American mechanics, determined last year to add a trade school to their work. With this object in view they issued in November a pamphlet appealing for aid in establishing such a school. Through the generosity of friends of the movement in Boston sufficient funds were provided to erect the necessary building and to equip an initial class, the plumbing trade being chosen as the first to be taught. On January 24 of this year the plumbing school was opened under the instruction of William L. Pierce, foreman for one of the leading plumbing firms of Boston, and it has so far proved remarkably successful.

Samuel F. Hubbard, superintendent of the union, writing to us recently, says in reference to the class: "Our little school has been started as an object lesson to encourage, as far as an example can do, the growth of the trade school idea. We have accommodation for only 29 pupils, and every place was filled within a week after the announcement was made. We have numbers on the list for the fall term. We are having the hearty co-operation of the master plumbers. Wm. H. Mitchell, president of the State Master Plumbers' Association, has given it much attention, and T. J. Tute has given most of the lectures."

The general plan of instruction closely follows that in operation in the New York Trade School, known as the Auchmuty system. The course consists of 50 lessons on two or three evenings of each week, ending in May. Examinations are then held by a committee of master and journeymen plumbers, when certificates are given to those pupils who are successful in passing the tests.

The general regulations are as follows: Seventeen years is the minimum limit of age at which scholars are admitted, and a reference as to character is required from each candidate. A fee of $10, payable in advance, is charged. All the required tools are provided for each pupil and materials are supplied free of cost. No one is admitted for less than the entire course.

The course of instruction is made progressive and is designed to cover the whole theory and practice of sanitary plumbing as thoroughly as possible. Each pupil is required to do the following work in the order in which it is given:

1. Seams.
2. Overcast joints.
3. Cup joints.
4. Calking.
5. Wiping horizontal round joints.
6. Wiping horizontal branch joints.
7. Wiping upright round joints.
8. One-fourth bends.
9. Wiping upright branch joints.
10. Wiping on a stop cock.
11. Wiping a flange on a 2 inch pipe.
12. Wiping a 2 inch ferrule.
13. Wiping a bath plug.
14. Wiping a vertical branch.
15. Wiping an upright flange.
16. Traps.

On completion of this course miscellaneous work is done, such as wiping 4-inch ferrules, making tank seams, wiping 2 and 3-inch joints, making service boxes, bottle traps, sand bends and fancy work. Lectures are also given at stated intervals explaining the principles which underlie the craft of plumbing, and every effort is made to impart to the learners as complete a knowledge as possible, within trade school limits, of the practical and scientific sides of the trade, leaving facility and speed of execution to be acquired subsequently by practice in the trade itself.

The first commencement exercises of the plumbing school of the North End Union were held in the Union hall on the evening of May 23, when the students were addressed by several prominent plumbers and others interested in trade school work. Samuel F. Hubbard, superintendent of the Union, presided, and was supported by Daniel G. Finnerty, president of the National Association of Master Plumbers; Wm. G. Mitchell, president of the State Association; William H. Sayward, secretary of the National Association of Master Builders; Samuel B. Capen, Rev. Charles J. Ames and others, who all indorsed the work of the school and expressed the hope that there would be a far larger number of trade schools in existence in this country. Specimens of the work of the pupils were on exhibition, and elicited the unqualified approbation of the visiting expert plumbers.

Superintendent Hubbard announced that the class would be resumed early in the fall. The plumbing class has been limited in number, owing to lack of room, but this drawback will, it is hoped, be overcome in time, as the school enlarges its borders. Other trades will also be taught. All communications in reference to the school should be addressed to Samuel F. Hubbard, superintendent, 20 Parmenter street, Boston, Mass.

The Consolidated Lehigh Slate Company, 154-156 South Fifth avenue, New York, make a specialty of plumbers' slate goods. At their showrooms samples can be seen of slate slabs for pantry sinks with splash and drain boards. They also show slabs for water closet bottoms and both round and square slabs for corner lavatories. A slate tank such as is used for chemicals is shown, and also slate urinal stalls. Register borders for both round and square registers in all standard sizes are carried in stock, and special sizes can be furnished at short notice. A specialty is making slate work to specification, and they are in possession of facil-

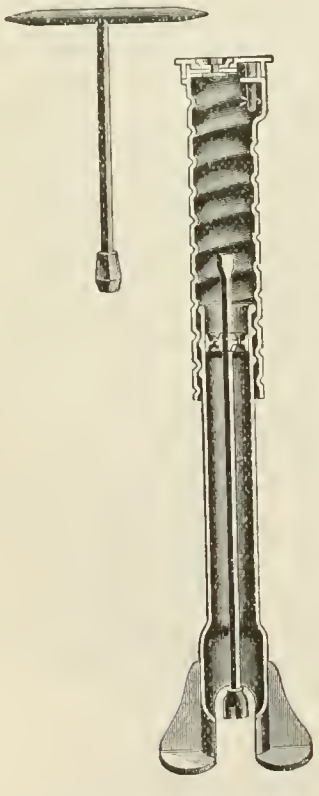
ities by which orders can be promptly filled. They also do a large business in roofing slate.

The Illinois Master Plumbers.

The Executive Committee of the Illinois Master Plumbers' Association held a meeting in the rooms of the Chicago Master Plumbers' Association, 173 Madison street, Chicago, on Monday, May 21. The committee is composed of the following members: President, Robert Loudon, Bloomington; vice-president, W. T. Geary, Chicago; treasurer, J. R. Scanlan, Elgin; Wm. H. Durham, Rockford, and T. P. Culloton, P. Sanders, David Whiteford and A. W. Murray, Chicago. The meeting was called to advance the interests of the State association, and judging from the reports read from nearly all parts of the State the various local associations are in a flourishing condition. It was moved by Mr. Murray that the place of meeting of the State convention be selected by the president and vice-president. On motion by Mr. Wade, it was decided that the convention be held Thursday, June 7. As Secretary W. E. Goodman had retired from business, J. B. Breen of Chicago was appointed to take his place.

National Service Box.

Ette & Henger Mfg. Company, St. Louis, Mo., are offering service boxes as shown herewith. The special feature

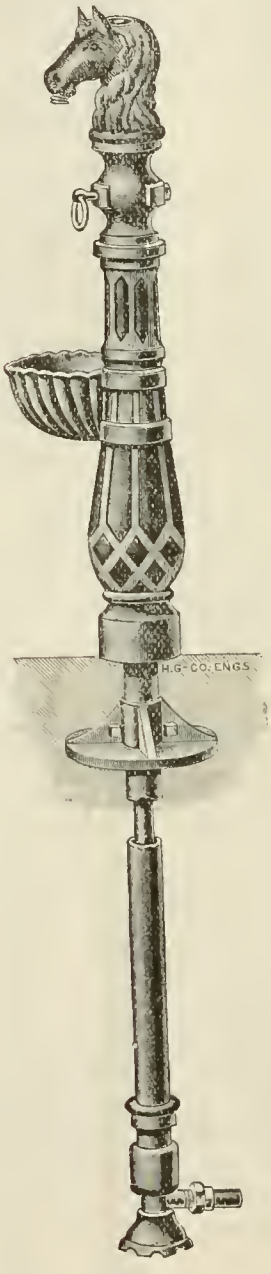


National Service Box.

is a stationary rod inside the box, attached to the service cock, and extending to within 12 or 18 inches of the surface. The combination key shown at the left of the box is adapted to opening the cover and also to fit on the end of the stationary rod, the same key serving both purposes. The manufacturers refer to the greater convenience of the short key as compared with the old style of long key for turning off or on, and state this device for stationary rod can be used in connection with all lengths and sizes of service boxes made by them.

Compression Stable Hydrant with Drinking Fountain.

Ette & Henger Mfg. Company, St. Louis, Mo., are offering the stable hydrant and fountain shown herewith.



Compression Stable Hydrant with Drinking Fountain.

The hitching post is ornamental and extra heavy with a stock 4 feet high, cast in one piece, the water passing through the inner pipe. A wheel handle is furnished instead of a key for turning the water on or off when so desired. A heavy flange is placed on the pipe to prevent the post being moved out of the ground by either horse or frost and to relieve the valve from strain. The manufacturers claim the device is anti-freezing, that there is no packing in the top parts and that it can be repaired without digging up. The posts are made to set in the ground from 1½ to 10 feet.

TRAPS AND VENTS.

An interesting case was recently decided in the New York courts which determines the standing of plumbers who have not complied with the law requiring registration with the Board of Health. An unregistered plumber sued for payment of work in the District Civil Court and won his case. On appeal to the General Term of Common Pleas, it was brought out that the plaintiff had not passed his examination, and the judgment in his favor was therefore set aside. If it becomes generally understood that work done by unlicensed plumbers is illegal and payment cannot be collected in the courts, it will have great effect in making all legitimate members of the trade comply with the strict letter of the law. It is said that there are over 500 plumbers at present in New York who are carrying on their business contrary to law, and it is extremely probable that a great many out of this number are not true plumbers at all, and if they can be compelled to stop work it will be much to the benefit of the regular plumbers in the business.

The State Association of Master Plumbers of Kansas met in their fourth annual session as Kansas City last week. There was a large attendance, nearly every firm doing business in the larger cities being represented. The convention was presided over by William Rowan of Arkansas City. The next meeting will be held in Topeka. Officers were elected for the ensuing year as follows: James Foley, Leavenworth, president; John Beasley, Pittsburgh, vice president; F. W. Doane, Lawrence, secretary; G. W. Searles, Atchison, treasurer.

Wright Brothers have opened their plumbing store and shop in Jones' Block, Ipswich, Mass. They have stoves, tinware and plumbing stock.

Clarence Hall has purchased the plumbing and piping business of R. W. Whelden & Co., Oldtown, Maine.

P. J. Casey of Claremont has opened the plumbing business in Lewis' Block, on Sunapee street, Newport, N. H.

The next convention of the State Association of Master Plumbers of Texas will be held at Austin some time in May, 1895.

The Coyne & Delaney Mfg. Company were recently incorporated under the laws of the State of New York to manufacture plumbers' supplies and metal ware in Brooklyn. Their capital is placed at $50,000. The directors named are Thomas F. Coyne, John J. Delaney and Hartman Hebeler of Brooklyn; Fred. A. Meyer of Rockaway Beach and Thos. D. Riley of New York City.

The Cleveland Rule & Handle Company, Cleveland, Ohio, send out card circulars directing attention to the Donohue soldering copper handle which they manufacture.

The Armstrong Mfg. Company, Bridgeport, Conn., say that the recent improvements made in the Armstrong pipe threading and cutting off machines have decidedly increased the demand for them. The same firm also report a brisk trade in their stock of dies and other tools for water, gas and steam fitters' use.

The charter of incorporation for the Association of Master Plumbers of the City of Memphis, Tenn., was filed for registration last week. J. A. Bailey,

John J. Bailey, C. E. Shinnick, A. Lagomarsino, Joe Massa, F. W. Reinhardt, C. J. Schultz, George T. Tweedy, Louis Tisdale, Frederick Fisher, John Hopkins, W. B. Lockey, Thomas McGrath, Edward McGowan, P. Callahan, R. H. Woods and Martin Woods are the incorporators.

FIRE completely gutted the plumbing shop owned by A. Levy, at 4009 State street, Chicago. It was partially insured.

THE MASTER PLUMBERS' ASSOCIATION of Salem and Vicinity has affiliated with the National Association. The association has 23 members, as follows: Salem—J. H. Trow, secretary; Jos. A. Andrews, John F. Cabeen, Frank Dearborn, H. M. Cawley, Frank Wendall, P. H. Sweeney, Geo. Norton, Chas. H. Phippen, Wm. H. Hart, C. J. Driscoll. Beverly—R. Robertson, president; J. Robertson, D S. Ingersoll, C. G. Pickett, A. M. Stevens, Wm. A. Weber. Peabody—Daniel B. Lord, E. G. Kelly, Geo. H. Norton & Co. Danvers—C. P. Perkins & Co., J. E. Ropes & Co., Caskin & O'Connell.

A MEETING was recently held by the master plumbers of Lynn, Mass., for the purpose of organizing an association. National President Daniel G. Finnerty, P. H. Winn of Nahant and several members of the Salem Association were present. The organization was started with 15 charter members and elected J. F. Morgan president, E. D. Russell secretary and J. C. Donnelly treasurer.

AT A RECENT MEETING of the Master Plumbers' Association of Cambridge, Mass., all the master plumbers of the city were invited. National President Daniel G. Finnerty and J. Warren French, president of the Boston Association, were present. A. Baumeister presided and addresses were made by the guests and the Inspector of Plumbing of Cambridge. After the meeting a banquet was served.

THE ATTENTION of the passer by is attracted to the establishment of the Colwell Lead Company, 63-65 Centre street, New York, by new plate glass windows in the front and a fresh coat of light colored paint and the regilding of the faucet which has hung in front of the establishment for years. Inside a greater display is made of plumbing goods than heretofore. The Scioto siphon closet is set up in working operation and a fine display of lavatory bowls is hung around the showroom. The office department is on the upper floor. Back of this building is the works and warehouse, which extends through to 524 Pearl street. Here are arranged their hydraulic pipe presses for making lead, tin and tin lined lead pipe; also their tower for making shot in all sizes from duck shot to buck shot. Their sheet lead mill, capable of turning out lead in sheets 8 feet in width and of various lengths and thicknesses, occupies a portion of this building. In the warehouse is a stock of all kinds of pipe and sheet lead, so that no order is long unfilled. They also make a specialty of cames for glaziers' use, both milled and unmilled. On the other side of Centre street a large building, at 66-68, is used by them as a storehouse for a general line of plumbers' supply goods.

ANTHONY F. BIEHL, a well-known plumber of Lancaster, Pa., died quite suddenly last week of pneumonia, after a brief illness. He was 44 years of age and is survived by a wife. He was a member of the St. Michael's and St. Anthony's societies and the New Knights of St. John's.

A. J. HUSTON, representing the Hart Mfg. Company of Cleveland, Ohio, is visiting the pipe and fitting trade of New York City in the interests of their Duplex stocks and dies to use for threading pipe and bolts. One of the features of the tool is that after the thread is cut it can be removed from the pipe or bolt without the slow process of unscrewing.

GEORGE BROWN of the plumbing firm of Brown & Byrne of New York City has entered into partnership with Amsbury & Son in the plumbing business at Penn Yan, N. Y.

LATTA AND FRANK LEIBOLD are placing goods in the Benham store room on Lincoln avenue, Goshen, Ind., for a plumbing establishment.

DU BOIS & DARRAGH, 61-63 Gold street, New York, have the New York agency for the Eureka smoke testing machine manufactured by the Bailey-Farrell Mfg. Company of Pittsburgh, Pa. They are meeting with considerable demand for this character of apparatus, and the smoke test is growing in popularity with plumbers owing to the fact that leaks can be detected by seeing the smoke escape as well as by the sense of smell.

GUIMARIN & BIXBY are a new plumbing firm at 9 South Broad street, Atlanta, Ga.

THE MOSELY FOLDING BATH TUB COMPANY, 161 South Canal street, Chicago, have issued an exceedingly artistic catalogue of their specialties. It comprises 32 pages of illustrations and descriptive matter. An introductory article sets forth the special features of the Mosely folding bathtub and gives details of the character of the materials entering into its construction. The styles shown are the Atlantic, Pacific, Northern, Southern, Wagner, Hub, Columbia, Armour, Exposition, Chicago and Pullman. These differ in details of style and finish as well as in methods of operation. All are folding tubs, but some are made to be heated with gas, others with gasoline and others to be attached to regular water service. Those with tanks and heaters attached are portable and can be placed in any room, thus making it unnecessary to have a special bathroom in a house. The catalogue also shows the Petite, a combined bidette, chiffonier and wardrobe. All their goods are very handsomely finished and some are richly decorated. Separate illustrations are given of the Mosely improved water heater, the Security waste and overflow combination faucet and a special supply faucet for supplying water by pressure to both tank and tub.

G. A. STANFIELD, who for the past two and one-half years has been in the employ of the Marietta Plumbing Company, has established himself in the plumbing and gas fitting business at 411 Second street, Marietta, Ohio.

JOHN HILDEBRANDT is fitting up a room on Fourth street, Logansport, Ind., where he will establish himself in the plumbing and gas fitting business.

PORTSMOUTH MACHINE COMPANY, Portsmouth, N. H., who are sole proprietors and manufacturers of Critchley's patent expanding reamer, advise us that the demand for this specialty still continues active. This concern also make an extensive line of plumbers' brass goods.

Alfred Hopkins.

At a special meeting of the Bridgeport, Conn., Master Plumbers' Association, last week, the following resolutions were offered and adopted in remembrance of the death of Alfred Hopkins:

Whereas, The untimely death of our dear friend, Alfred Hopkins, has removed from our midst one of the most popular members of our Bridgeport Master Plumbers' Association;

Whereas, The good Lord has seen fit in His wisdom to call him to a happier resting place above;

Whereas, The members of our association will miss him at their regular meetings and on their pilgrimages each year to State and national association gatherings, held for the elevating of our craft in knowledge and skill in their profession, for the benefit of the health and convenience of mankind in general:

Whereas, Without his good fellowship and practical experience our meetings will never seem the same again, with him absent from our side;

Whereas, His friends always felt renovated in mind after meeting him, he was so genial in his greeting, so generous to his friends and the deserving poor;

Whereas, He was sought after by hosts of friends, by his employees and others that needed a kind and sympathetic shake of his hand, with a cheering word in their hour of trouble. His consideration and good advice often lifted the load from their minds and they departed from his presence with new courage;

Whereas, The lesson taught to the members of our fraternity in losing our companion should be kept continually in our remembrance, as the same summons might overtake one of us. We then should be prepared to meet that unseen and unknown country, leaving this mortality for that immortality beyond this vale of life's struggles;

Resolved, That by his death we have lost a valuable member and the city of Bridgeport a good citizen. To his family in this their hour of bereavement the members of our association extend their heartfelt sympathy;

Resolved, That these resolutions be placed upon the records of the association, and that an engrossed copy of them be sent to the family of the deceased.

The closing of all the workshops of the Grand Trunk Railroad is being seriously felt in Canada. In Montreal alone some 2500 men have been thrown out of employment.

The *Iron and Steel Trades Journal* of London reports that the demand for galvanized iron for shipment abroad was never so heavy as at present, notwithstanding the fact that owing to the depression in Australia, those colonies—usually the largest customers—are taking only about one-half of their usual supply. The use of galvanized iron throughout the world is growing rapidly, and new markets for this material are opening up annually.

The new $3,000,000 tunnel built through the Palisades by the Susquehanna & Western Railroad was formally opened for coal traffic on May 15. The tunnel is nearly 2 miles long.

The successful completion of the Manchester Ship Canal on the west coast of England has induced the trading community of Sheffield to take steps for carrying out the long contemplated plans for a ship canal from their city to the eastern coast. A company has been formed for the purpose, and a bill is now before Parliament authorizing the work of construction.

STEAM AND HOT WATER.

Cost of Heating Plants.

The question of ventilation in the public schools is just now engrossing a good deal of attention, says a writer in a Worcester, Mass., paper, and how to have the rooms heated and the air pure is the problem. Bids have been asked by the city for the heating and ventilation of Thomas and Winslow street school houses. Changes have been ordered in these buildings by the State officers.

There are various systems in use in the schools, and the cost for each room varies from $40 to $108, as shown by the report of the Superintendent of Public Buildings. It has always been a question why there should be such a difference, and people have wondered why one room could not be heated just as cheaply as another under the same conditions.

The Canterbury, Belmont and Salisbury street houses and the English High School are all provided with a mechanical system of ventilation, that is, a system where steam engines are used to run a fan. These buildings are also heated by steam.

In the Winslow and Thomas street schools there is no system, and these two buildings will have to be ventilated this season.

Lamartine and Downing street schools are provided with the furnace system of ventilation. In Ash street is the Sturtevant system. The following figures from the report of the Superintendent of Public Buildings show the cost of heating and ventilating each of the buildings mentioned, and also each room:

	Rooms.	Total.	Per room
Canterbury street.. ...	12	$1,293.70	$108.22
Belmont street...	16	854.65	53.42
Winslow street.....	13	828.81	63.76
Salisbury street.....	10	50 .76	50.57
Lamartine street.	12	836.58	69 71
Downing street.....	12	729.77	60.81
English High.....	22	2,334.41	105 97
Classical High...	16	1,450.89	90 67
Ash street...	6	408.00	68 00
Thomas street.....	12	484.73	40.00

HEATING NOTES.

We have received from the Magee Furnace Company of Boston, Mass., a very neatly printed catalogue of 40 pages, printed in colored ink and bound in paper covers of attractive design. Its pages are devoted to the Magee warm air and hot water combination heater, made in six sizes and having a hot water capacity ranging from 75 to 700 square feet of radiating surface. The opening pages are given up to the subjects of heating and ventilation, followed by an illustrated description of the construction named. One page shows Magee's Boston heater as it appears in the basement of a dwelling, indicating in a general way the arrangement of pipes and fittings. Another page shows the relative position, as they appear in the heater, of the hot water sections and disk, while a third illustration shows the various sizes of hot water sections and disks used in the Magee combination system. The water sections are placed in the fire pot 4 inches from the bottom, and each one takes the place of 2½ bricks. Each section is tapped for 1¼-inch, flow and return, although the double sections can be tapped for 2-inch if necessary. An interesting feature of this neatly arranged publication is found in the floor plans of a residence in Malden, showing the location of the heater, size of pipes and position of registers and radiators. The residence is heated with a No. 5½ warm air and hot water combination heater, four long water sections being used, attached to 425 square feet of radiating surface. The second half of the pamphlet is devoted to hot water radiators, tables giving list of sizes of Standard and National radiators, ratio of radiating surface to space heated, directions for using the Magee warm air and combination heater, tables showing sizes and prices of registers, capacity of pipes, together with a partial list of persons in various sections of the country to whom the manufacturers refer for information as to the merits of their heater. Numerous views are also given of buildings in which the company's heater is used.

The Baltimore Heating Company were incorporated recently at Baltimore, Md., with a capital stock of $5000, by John Trainor, John J. Kelly, Patrick Flannigan, Louis Becker and Duane B. Van Buren. The company will deal in stoves and other heating apparatus.

The J. H. McLain Company, Canton, Ohio, send out circulars illustrating the Canton heaters of their manufacture. This firm make an extensive line of steam and hot water heaters, the illustrations showing the Humber water heater, the Harvard water heater, Cambridge steam heater and the Yale and Sandow water heaters, all of which are illustrated in general and sectional views.

The New York Central Iron Works, Geneva, N. Y., are in receipt of a letter from the Assistant Quartermaster U. S. Army, Plattsburgh, N. Y., in which he says that he has set up under contract 29 Dunning boilers for heating officers' quarters, barracks and other public buildings at that post, and has been very much pleased with their performance.

The Gorton & Lidgerwood Company, 96 Liberty street, New York, have installed Gorton boilers in many prominent educational institutions during the past winter, and in all cases, we understand, the heaters have given excellent results. The firm report a good spring business and a favorable outlook for the future.

George W. Plastow, heating and ventilating engineer, representing Johnson & Morris, steam and hot water contractors, 239-241 South Fifth avenue, New York, is on the card presented to those who are interested in the question of heating and ventilation. Mr. Plastow recently visited a customer who gave an order for a considerable heating plant, saying: "More than 20 years ago your house heated a building for me, and the plant has been so free from annoyance and excellent in service that I remembered your house when I wanted this building heated."

A new attraction has lately been put in front of the establishment of the Crane Company, 122-130 Centre street, New York, dealers in pipe and pipe fittings. A length of 12-inch wrought iron pipe is supported by a stand made of flanges, nipples, reducers, ells and water ells, surmounted with a tee at the top of which is used an acorn for a finish. The pipe is protected by a coating of transparent varnish and the name of the concern, "Crane Company," occupies the center, while at one end is, "Pipe ¼ to 24 inches in diameter" and at the other end are the words, "All sizes cut to sketch." At the corner of their building they have a 24-inch flanged tee.

The American Boiler Company, 94 Centre street, New York, have secured Parlor 217 at the Broadway Central Hotel, at 667 Broadway, where they will receive and entertain their guests at the convention of the National Association of Master Steam and Hot Water Fitters on June 19.

"Standing on the corner of Broadway and Duane street, New York, the following large buildings in which our radiators have been used can be seen: The Scott & Bowne Building, Produce Exchange Building, Mutual Reserve Life Building, Home Life Building and the Manhattan Building, with the Sheldon Building on Nassau street just off of Broadway," was the remark of a representative of T. C. Joy & Co., manufacturers of radiators at Titusville, Pa., with an office at 48 Centre street, New York.

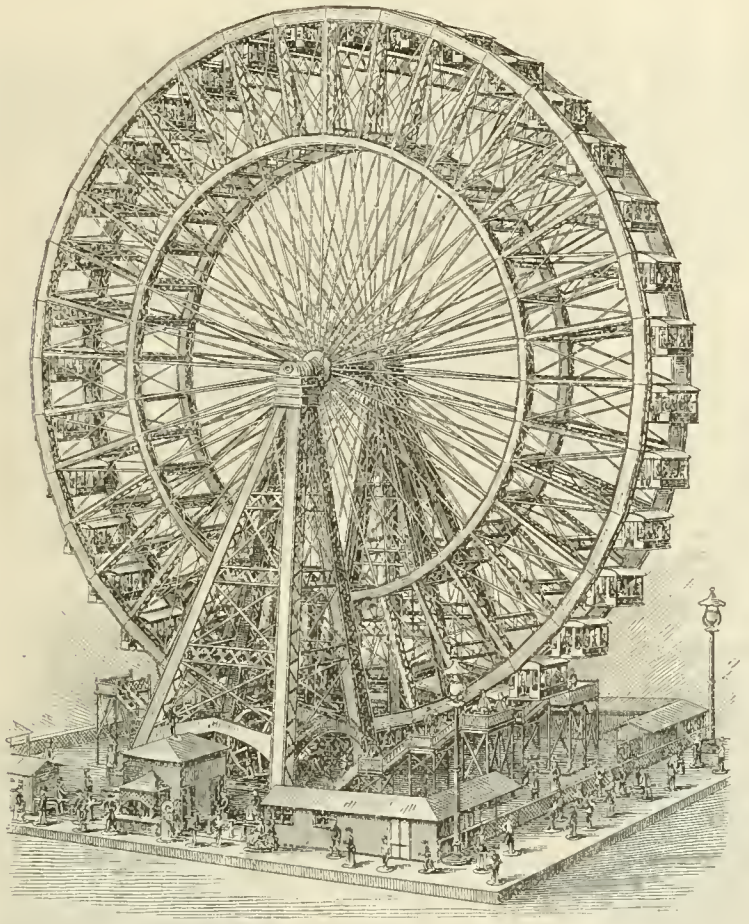
On Wednesday and Thursday of last week the New England trade were very pleasantly entertained at the opening of the new showrooms of the A. A. Griffing Iron Company, at 177-179 Fort Hill Square, Boston, Mass. Chas. A. Lathrop, the New England manager of the concern, discharged his duties as host in a most happy manner, and the many members of the trade present were unanimous in their verdict of "a very enjoyable time." The new showrooms occupy the entire first floor, 35 x 80 feet, are well lighted and particularly adapted for showing the extensive line of Bundy radiators made by this concern. The numerous styles and sizes were artistically arranged, with a background of palms and other potted plants, which, with the bright colors of the radiators, made a very handsome picture. The radiator decorations, which were done by James Croke of Boston, are particularly worthy of note, several new effects in amaranth, lilac, emerald green and aluminum bronze being shown together with all the standard bronzes and enamels. On Thursday evening a collation was served, at which there was an abundance of both eatables and drinkables. A quartet and an orchestra furnished music for the occasion.

W. H. Page of the W. H. Page Boiler Company, Norwich, Conn., was the guest of Du Bois & Darragh, 61-63 Gold street, New York City, where an agency for New York and vicinity has been established for the All Right and Volunteer steam and hot water boilers. G. H. Weymouth will represent the house in this branch of the business.

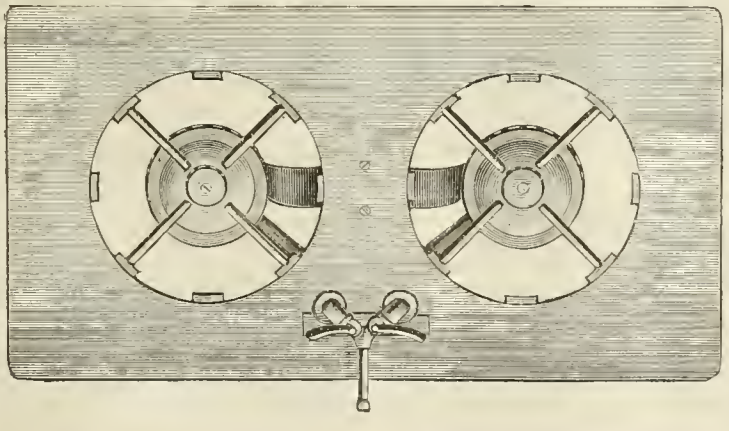
The Ferris Wheel in Tin.

We show in the accompanying engraving an unusually interesting example of the tinsmith's art. The picture, it is needless to explain, is a representation of the Ferris wheel in miniature, and we have received it, together with the following letter, from E. A. Armbruster of the Minnesota Hardware Company, St. Paul, Minn.:

I find great pleasure in reading *The Metal Worker*, which I have taken for many years. I am particularly interested in looking over the tin shop pages, in which are patterns and diagrams of various kinds of tin work. I send you herewith a photograph of an exact model of the original Ferris wheel which I have made of such scrap tin as goes to waste in the shop. The model is scaled ¼ inch to the foot of the original wheel, and is composed of 10,989 pieces of tin and wire. It is lighted up and run by electricity, there being a two-candle power incandescent lamp in each car and one on each corner as a lamp post. Each of the 36 cars is loaded with from 18 to 20 passengers. The guards and various other people, ticket offices, sheds, elevated platforms and push chairs are all cut out of tin and painted. It took about four months of my spare time, such as noons and evenings, to make it. We have rented the wheel out to various parties for exhibiting in their show windows, and at present have it in our own window.



The Ferris Wheel in Tin.



Portable Gas Appliances.—Fig. 1.—Gas Cooker.

Portable Gas Appliances.

The illustrations presented herewith show some patent portable gas appliances that are being manufactured by the New York Stove Works, Peekskill, N. Y. These appliances are specially designed for use in connection with coal stoves. Fig. 1 is a plan view of a gas cooker. It consists of a cast iron plate, to which are attached two gas burners, which are provided with separate gas cocks, one controlling each burner, and an extension nozzle, to which a hose can be attached. By simply lifting off the covers and cross piece over the fire chamber of any cooking range, the gas cooker can be set in place, the square plate enabling it to fit any stove regardless of the difference in size of the covers ordinarily found. Then a hose may be run to some convenient gas fixture and connected with the nozzle of the apparatus. This will be found specially convenient in cases where a coal fire has been used but has died out from inattention, as the gas cooker can be put in operation in a few minutes, furnishing a good hot flame for cooking, under one or two holes, as may be required. Fig. 2 shows a gas baker burner which is designed to be set in the oven and connected to some of the gas fixtures with a hose. To secure a more equal distribution of the heat a burner is placed under each end of the plate and connected to it. The food to be baked is then set on the plate the same as in an ordinary oven. In using the gas baker it is best to lift off the oven door of the stove, or if it cannot be lifted off, it should stand open. Fig. 3 shows the gas baker front, which is designed to fit on the baker and close the front of the range instead of the oven door, and is arranged with perforations, by which the oven is ventilated. The baker and front are made in three sizes, to suit different sized ovens, and the baker front is partially made of sheet iron, which allows it to be cut to fit the particular oven in which it is used. With these appliances any coal cook stove can be turned into a gas cooking apparatus in a few minutes, and all the benefits of a gas cooking apparatus derived. In addition to these appliances the company make a large variety of gas hot plates, sad iron heaters and gas cooking furniture. The management of this department of their business is in the hands of an expert, and they claim that their goods have proved highly satisfactory wherever introduced.

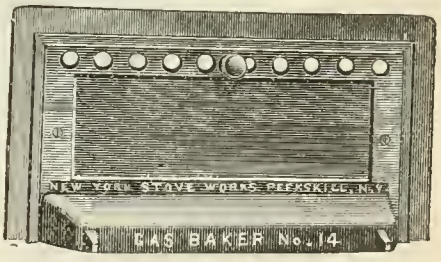

Fig. 3.—Gas Baker Front.

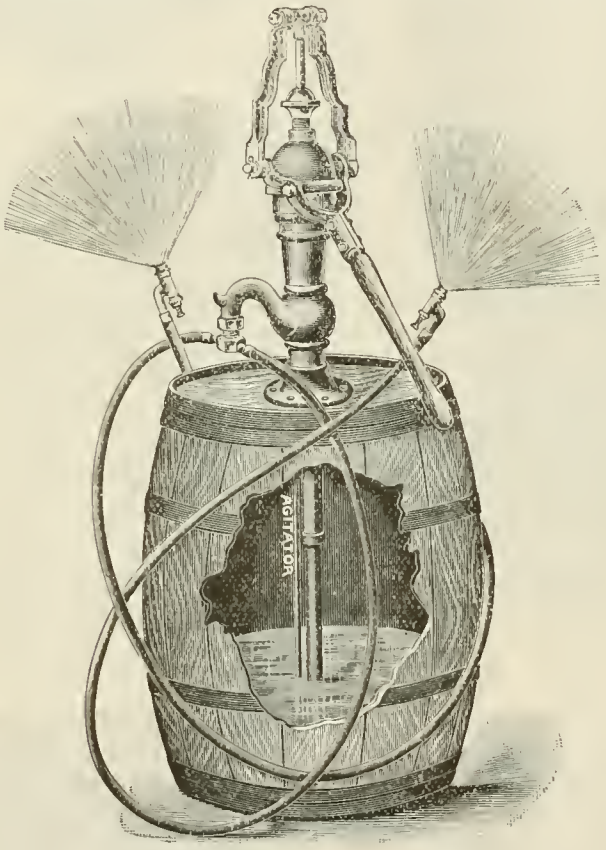
THE RETAIL STORE.

No. 16 Novelty Spray Pump.

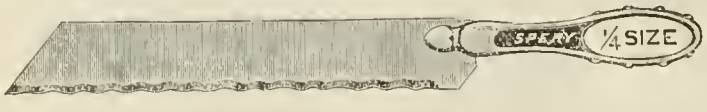
Hess, Snyder & Co., Massillon, Ohio, are offering a spray pump as shown in the accompanying cut. In construction, a heavy brass cylinder is screwed into the plunger or bottom of the pump, to make the pump short and strong. The handle can be placed in any position around the pump, which feature is referred to as an advantage. It is stated that the handle attachment which connects the handle with the plunger rod allows water to be pumped in large quantities with ease, and that the pump has a 6½-inch stroke. The agitator consists of a ¼-inch pipe which screws into the base of the pump and extends to the bottom of the barrel to keep the solution thoroughly mixed at all times. The pump is fitted with an attachment for either single or double line of hose, to which spray or solid stream tips can be connected. The pump is designed to attach on a tank or barrel, as shown in the cut. The manufacturers claim that the pump can be taken apart in five minutes, and that nothing but the best material enters into its construction.



No. 16 Novelty Spray Pump.

Spery Serrated Edged Knives.

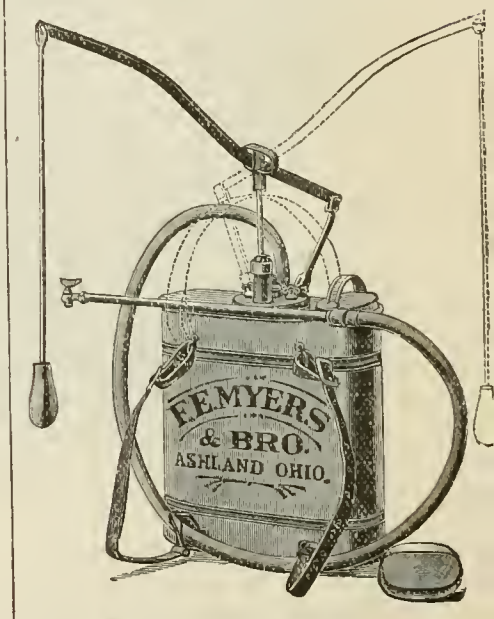
Charles F. Spery & Co., St. Louis, Mo., for whom Bronson & Near, Cleveland and New York, are sole agents, are introducing serrated edged bread, cake, paring and coring knives, as herewith shown. It is explained that the serrations in these knives are deep and shallow, short and long; the short, shallow teeth doing the principal cutting, the long, deep serrations preventing any possible clogging and tearing. In other words, it is remarked, uneven serrations do the work more easily and much smoother, upon the same principle that a serrated or saw edge knife will cut hot bread or cake better than a common knife. The knives are made with straight and curved blades, the curved blade being recommended by the makers as superior for cutting bread or cake, as the center of the blade strikes the bottom of the loaf or the top of the bread board first, making as clean and perfect a cut at the bottom of the loaf, without tearing, as at the top. The manufacturers state that the knives are made from crucible steel, finely tempered, and that they will not only retain their shape but will hold a perfect cutting edge. The knives are sold in sets, set No. 1 containing 1 each bread, cake and paring knife, straight blade; set No. 2 containing the same assortment with curved blades.



Spery Serrated Edged Knife.

The Myers Knapsack Spray Pump.

F. E. Myers & Brother, Ashland, Ohio, are introducing a knapsack sprayer, as herewith illustrated. The tank is made to hold five gallons and is fitted with removable lid and strainer. The pump is constructed of brass, so as not to be affected by the poisonous arsenites used in the various formulas for spraying. The pump has a large air chamber, ball valves, solid plunger and agitator. The point is made that the pump is so arranged that the hard work is done on the down stroke of the piston, and so that no water can drip on the operator. The pump can be removed from the can easily and is fitted with handles, so that the operator can use it with either the right or left hand, as the cut indicates. It is explained by the manufacturers that by removing the lever the sprayer can be used in the same manner as their tank spray outfit, by setting the knapsack on the ground and working the pump by hand hold. The dotted lines indicate the manner in which the strap can be snapped to the opposite side of the can in a loop, serving in this position as a bail to carry it by when using it as a tank sprayer. The sprayer is referred to as a common sense device, answering the purpose of a knapsack sprayer equipped so it can be operated with the right or left hand, and also so arranged that it may be used as a tank or can spray, thus making it competent for washing windows, buggies, and for other uses of this kind at times when it is not required as a knapsack sprayer.



The Myers Knapsack Spray Pump.

STOVE TRADE NOTES.

The Local Stove Trade.

The stove trade in New York and vicinity, as interpreted from the various terms used by the dealers to designate its condition, is between very bad and fair—the adjective "good" being seldom heard in this connection. It has been so since March, a month in which the trade in stoves reached proportions more nearly normal than for several months before. It was due, it might seem, to a renewal of manufacturing operations in many lines, based in some cases upon an assumption that the breaking up of winter would bring an end to suspended demand, and in others to the charitable disposition of the bosses. It continued for a few weeks only, until the hallucination was shattered on the one hand and bank balances on the other.

The demand which set in at the close of winter was short lived, and production necessarily so, proving that production must follow and not precede demand. The people's requirements must be greater than for years past, but their means are smaller and their confidence less.

When an epidemic of disease is on the wane there still remains some sickness and almost as much fear, the latter element continuing to disturb the equanimity of the public mind long after the danger is past. So with a commercial panic—the panicky feeling, the distrust and want of confidence remain after the cause has disappeared, and the fear created by a panic in business in 1893 is not one to be soon forgotten. The man who has been idle for months will not feel sure that his troubles are ended for good when reemployed, and will fortify himself against a similar experience all he can. The business man who managed through great efforts and the strictest economy to tide over the crisis will not be apt to plunge into extravagance. The burnt child dreads the fire, and it would take an unexpected boom quite as astounding as the panic to draw men's minds entirely away from the morbid condition into which they have fallen, and which the slow growth of returning prosperity will take months to accomplish.

That thousands of men who have been idle for a long time have obtained employment this spring there is no doubt; that they have worked for less money and followed a strict rule of economy and paid back borrowed money there is no question; that they have bought but little is also a fact, for the sale of stoves still shows a lack of orders for such goods as the masses buy. The sale of oil and gas stoves has been a disappointment to dealers as well as coal constructions, though an impression prevailed with many that trade in them would be good, and many would buy such stoves who could not afford the outlay for the high priced ranges. Collections with the wholesale stove houses have naturally been affected, as the scheme of finance followed with a large proportion of the smaller stove merchants resolves itself into paying for winter stoves out of the proceeds of spring sales of oil, gas and coal stoves, and for those from cash received for baby carriages and refrigerators, and for them from the sale of winter stoves again.

A strange freak of trade is its great unsteadiness. It is not evenly dull nor steadily fair. For one or two days it is good and everybody is busy, only to be followed by extreme dullness with nothing to do. However, business is certainly on the up grade, but the grade is steep and the going slow. The market is running low in some sizes of many articles manufactured of metal, an uneven depletion of stocks that leaves too much on hand in the aggregate to warrant a resumption of factory operations and so little of ready selling sizes that sacrifice in price is not necessary or wise. SIFTER.

Estate Oak Air Tight Radiator.

F. & L. Kahn & Brothers of Hamilton, Ohio, have placed upon the market a handsomely decorated heater, which is known as the Estate Oak air tight radiator. This consists essentially of an oak stove located within a perforated jacket. The base, instead of being composed of the usual three, four or five pieces, having numerous joints, is made in one piece with only 52 lineal inches of joint space, limited exclusively to the ash pit door and registers. The inner body is corrugated for the purpose of providing largely increased radiating surface and immunity from cracks and wear. The stove is mounted on legs in the usual way, but they are so arranged with respect to the extreme bottom that base strips are attached to cover all without the use of bolts. There are provided in a very clever manner circulating ducts for the passage of air between the inner body and the envelope or jacket from the extreme bottom to the top. The draft registers, instead of sliding, are made in the form of a screw with circulating cap and handle at one end, which offer opportunity for close grinding and adjustment. The stoves, although intended chiefly for use in soft coal regions, have been adapted and are claimed to possess all the requirements of successful hard coal burners. The magazine is jointless and made in one piece to prevent leakage. The manufacturers state that fire can be kept continuously from one charge of fuel of any kind as long as 50 to 60 hours, depending upon the quality of the fuel and the character of the chimney. The stoves are offered at a moderate price, on which account large sales are anticipated. We understand that the makers have already secured four patents covering the improvements and several more applications for patents are now pending.

William Resor & Co.

of Cincinnati, Ohio, favor us with a copy of an exceedingly neat and tastefully printed price-list and catalogue which they have issued relative to their leading specialties. Since the last edition was distributed to the trade the makers have added a number of new styles and sizes to their list, covering cook stoves, ranges and heaters. Among the latter may be mentioned the Royal Monitor six-hole cook stove, intended for burning wood as a fuel. Its constructive features include detachable end top shelf, ventilated oven, large smooth swing hearth plate, patent oven door opener, portable reservoir, which is placed over the two boiler holes in front of the smoke pipe, and an arrangement of the front swing fender by which the overdraft to the fire box when starting the fire is prevented. The Royal Monitor is made in two sizes and several varieties. Another novelty which the company have recently introduced to the trade is the Electric Monitor six-hole range for using coal. This stove has extra large water front, heavy fire box linings, cut top and bottom oven plates, patent oven door opener, large sheet flues, ventilated oven and shaking and dumping grate. It is made in two sizes and presents a substantial appearance. The ornamentation is effective, the treatment of the oven door being rather out of the ordinary. Another construction to which special attention is invited is the Monitor base burner for hard coal. This is made in three sizes, has large magazine, made in sections, heavy fire pot, duplex grate, capacious ash pan and tea kettle attachment. The nickel parts are so ventilated that they will not discolor, and the top ornament is a handsome combination of polished brass and nickel with enameled base.

The upper section of the stove is so constructed that there is formed between the nickel work and the main plates of the stove a large hot air chamber, this being connected at the back with the circulating flues, which extend to the floor. The catalogue consists of nearly 150 pages of letterpress and presents illustrations of an extensive assortment of Monitor stoves, ranges and heaters.

THE BUSINESS recently owned by the Lake Shore Foundry Company of Chicago and operated under the name of Metzner & Co. has been sold to the Manufacturers' Stove Repair Company. The new company are enjoying a large

trade and are organized on a substantial financial basis. The Lake Shore Foundry Company guarantee all bills that may be contracted by them until further notice.

New Chicago Warehouse of Detroit Stove Works.

The Detroit Stove Works have just completed a fine warehouse in Chicago, located at Nos. 2921 to 2929 La Salle street, between Twenty-ninth and Thirtieth streets. The rear abuts on the Chicago, Rock Island & Pacific Railroad, from which the stove company have a private siding which runs in on their own ground immediately alongside their building. In acquiring this site the company purchased more ground than is covered by the warehouse, with a view to possible enlargements in the future. The size of the building is 100 x 105 feet, five stories high, not including the basement. Being built by the company for their own exclusive use, the warehouse was designed to meet the special requirements of the stove trade. The arrangements are, therefore, of a special character, and the details are peculiarly worthy of extended notice.

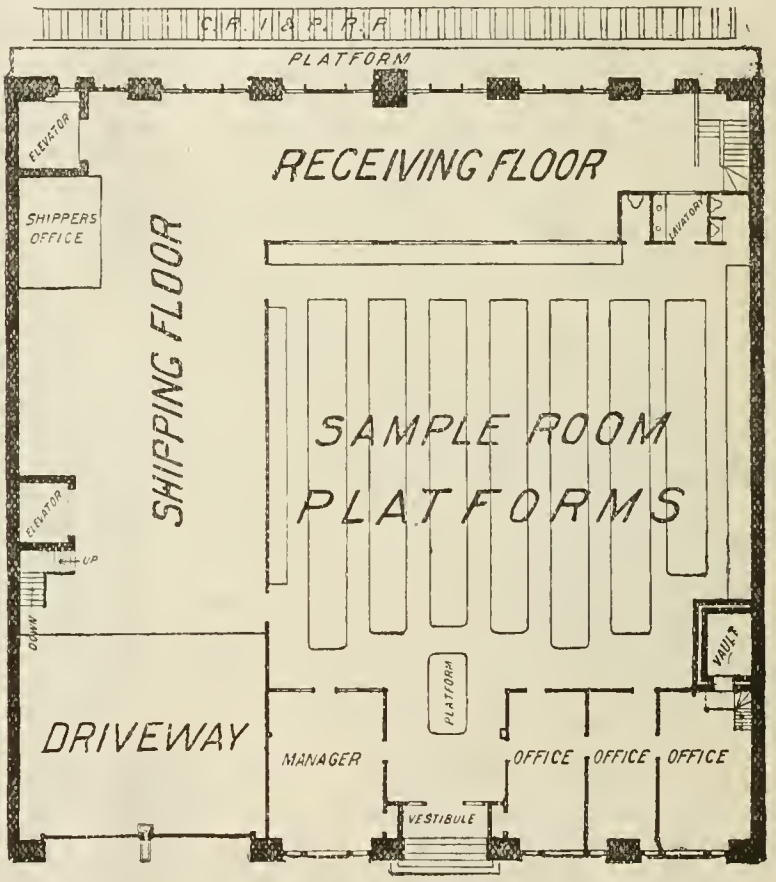
The first floor, a plan of which is shown in the accompanying illustration, is laid out for offices, sample room and shipping room. The shipping room has not been sacrificed for the benefit of the offices, but has received proper attention. It extends in the shape of an L from the La Salle street front around the whole rear of the building. In the rear it faces the company's railroad track, along which a platform extends on a level with the floor of a freight car. There are four doors opening on the platform, and four cars can be handled at one time. It has been shown by actual test that a car can be loaded or unloaded here in half an hour. The shipping floor is large enough to set out from seven to eight carloads of stoves with ease. At the La Salle street end of the shipping room is a team entrance for city business which is capable of accommodating three teams at one time. Stoves can be loaded and unloaded here under cover, without regard to the weather. Two elevators are in use. One is a power elevator of large size which will carry a full team load. The other is a hand elevator, particularly convenient for lowering stoves from the upper stories for small shipments.

The sample room, on the same floor, is very commodious, nicely arranged and well lighted, having windows on three sides. The platforms have a hardwood finish, are varnished and have round corners, adding much to the appearance of the room. The steel range samples are placed in a row across the back part of the room on a platform slightly higher than the others, making a very fine display. The offices are in front. The manager's office is on one side of the main entrance and the general offices are on the opposite side. These offices are handsomely appointed, the manager's room being wainscoted in panels and furnished with a carved mantel, while the general offices are divided into several apartments by oak and plate glass partitions. A feature of the general offices is a large two story vault for storing valuable papers.

The basement has a high ceiling and is unusually light. In one corner is the engine room, containing a 20 horse-power Otto gas engine, which operates the power elevator. It is run with natural gas, but can be connected with the manufactured gas supply whenever necessary. A large part of the basement is occupied by the stove repair department, containing between 600 and 700 casting bins. Considerable room is left for the storage of stoves.

The upper floors are used wholly for storage purposes. On the second floor ranges and cook stoves are carried. The third floor is exclusively used for high grade heating stoves. All the space on the fourth floor is given up to Jewel oak stoves. The top floor is used for medium priced and lower grade heating stoves.

The building is pronounced by architects and builders as one of the very best warehouses so far erected in Chicago. It is a most substantial structure, having unusually heavy brick walls with steel girders, cast iron posts and 6 x 12 inch joists on every floor and



New Chicago Warehouse of Detroit Stove Works—Plan of First Floor.

even supporting the roof. All the floors are of hard wood. Every story is well lighted, so that stoves can be inspected in the middle of the building as easily as at the ends. The front is more ornamental than the regulation warehouse. It is faced with handsome dark colored pressed brick. The main entrance is recessed, with heavy iron gates guarding the approach. Taken throughout the building reflects great credit on owners and designers.

THE DETROIT STOVE WORKS exhibit on their sample room floor at 2921 to 2929 La Salle street, Chicago, a superb line of steel ranges. These ranges are more profusely ornamented than has generally been the custom, as a demand has sprung up for variations from the rigidly straight lines of such goods. The fronts are made of cast iron, molded with relief work, with ornamental columns at the corners giving apparent support to the top. The high shelf is built with the sides running in graceful curves, with nickeled edges. The interior construction is in keeping with the imposing exterior. Oven doors are balanced. Oven bottoms are not made in one piece, but are sectional, consisting of four pieces of flanged sheet steel, to guard against buckling.

The Keeley Stove Company

of Columbia, Pa., have just issued a 148 page catalogue descriptive of their line of goods. A leading feature of the book is the variety of stoves appearing this season for the first time. The opening pages are devoted to a presentation announcement, information in regard to ordering stove repairs, with price-list of repairs and terms and special notices. The catalogue proper commences with illustrated descriptions of the Columbian Newport and Newport ranges which are followed by the Columbian Choice, a new six-hole range in six sizes, suitable for hard or soft coal, with side ash pit, bed plate in two parts, tea shelf, reservoir, cozy high closet and heating attachment. The new Cappello is described as a new sheet flue range, in six sizes, for hard or soft coal or wood. Then follow more ranges, including the Columbian Choice, 1893, in two styles, and the New Cappello, 1893, also in two styles; Columbian Plato, Columbian Star, Columbian Charm, Columbian Dandy and Daisy, Columbian Gem, Vim, Columbian Bessie and Pet. Next in order are cook stoves, the line covering the Regulator, Golden Grain, Columbian Dora, Columbian Alliance, Miner's Friend and Dolly. About 38 pages cover heating stoves, prominence being given to the Columbian Joy, 1894 pattern, a reversible flue base burning square parlor stove, in five sizes, embodying the ventiduct system of circulation and radiation; the magazine is fitted without

holes or screws, and the whole stove may be easily dressed by a dealer without screws. It has cold air caps to keep the nickeled under body from tarnishing, and is supplied with center draw or triplex grates which can be removed or placed in position through the ash door. The Columbian Aid, Columbian Cadet, and Alpine stoves are also presented, followed by the Columbian Sun, a new surface burner, made in five sizes, and the Columbian Queen, a new return flue sheet iron surface burner of medium price with nickeled skirt and foot rails. Other new stoves shown are the Morning Light, a direct draft sheet iron single heater, and the Morning Light, a double heater in five sizes. The remaining heating stoves shown comprise the Grip, New Morning Light, Nobby, Active and Columbian Ulster. In open heaters are noticed the Luxury, Columbian Chime, Columbian Prize and Pearl. The Columbian Ulster, a portable heater, is shown remodeled, and the Columbian Crown is described as a new departure in stove construction. It is made to operate upon the ventiduct system, thus heating by circulation and radiation. The usual line of cylinder, laundry and wood stoves occupies some half dozen pages, followed by Columbian Vulcan and Columbian Banner furnaces, which have been redressed for the coming season's trade. A full page engraving shows the interior of a house heated with a Columbian Vulcan, with its hot water combination heating an upper room. One, two and three burner gas cooking stoves, lately put on the market by the company, are also illustrated, as well as a new gas heater for small rooms. The remainder of the book is taken up with utensils, tools and supplies and descriptive lists of repairs.

The company have this season adopted for their ranges interchangeable covers and centers, so that one size will suit all ranges. The centers are in two pieces, to prevent warping or twisting. Another improvement is in the style of shakers used. One shaker now will fit all stoves and ranges having the triplex grate. The shaker is to be known as the Columbian Daisy, and has a stop on the socket which prevents withdrawal until the grate is in proper position.

"The Blue Book of the Stove Trade"

is the title of a substantially bound volume of over 450 pages which is published by the American Stove Association of New York and Chicago. As indicated by its title it is a "blue book," being bound in stiff board covers of a shade of deep blue. The paper is of good quality and the edges are finished in bright red, giving to the volume a very attractive appearance. The work, which has just been issued from the press, is "a book of special credit reference for the use of all who sell to the stove trade of the United States." Probably the most conspicuous feature is the system of three ratings indicating the business investment, the total responsibility and the paying habits of the concerns rated. The preface states that the volume contains the names and ratings of nearly 40,000 merchants who sell stoves. From the prospectus which accompanies the work we learn that the purposes of the American Stove Association are "to furnish more accurate, prompt and reliable credit information than is obtainable from present existing sources; to protect prompt paying and responsible stove dealers by restricting to proper limits the credit of their incompetent, dishonest or otherwise unworthy competitors; to provide a means for the prompt collection of past due notes and accounts by more rapid and satisfactory methods than at present prevail, and the correction of the many petty abuses to which stove manufacturers are subjected at the hands of unscrupulous stove buyers." The manager of the association is Charles E. Brackett, Manhattan Building, Chicago, Ill. The New York office of the association is at 150 Canal street.

ODD PLATES.

THE MICHIGAN STOVE COMPANY, Detroit, Mich., are constantly extending the territory in which their goods are sold, and now and then receive orders from parts of the world where Garland stoves have never before been placed. During the past week the company received an order for two Garland stoves for shipment to Calcutta, India, and accompanying the order was the following explanation: "This order is quite a novelty, all of the parts considered. The stoves are to go from Calcutta 1000 miles northeast to Naga Hills, in Assam. For the last 500 miles of the journey they will have to be carried on the backs of natives. These stoves go 500 miles beyond where any stove has ever been sent, and it will take nearly a year for them to reach their destination."

The Metal Worker last week had the pleasure of a call from J. W. Lane, Newton, N. J., whose reminiscences about the early days of the stove and tin trade in New York City were exceedingly entertaining. Mr. Lane knew many of the old time Water and Beekman street merchants from whom he bought goods when he began business in Newton.

THE CANFIELD STOVE COMPANY, Rondout, N. Y., publish in connection with their advertisement in a recent issue of the Kingston *Daily Freeman* a series of verses entitled "A Grandmother's Surprise." The verses tell of the time when Kingston was a wilderness and of the old Dutch oven in which the grandmother baked her bread. They also tell of her first cook stove and in later years of her opinion of the first range she saw. Now, when she goes to visit her grandchild and watches the operation of a New Process vapor stove, her surprise is unbounded, and

> She hardly thinks it can be true
> Of all the work this stove can do.

THE STOVE PLANT of the Bussey & McLeod Company, at Troy, N. Y., will resume operations June 1, after a shut down which has lasted a number of weeks. The works will probably start off by giving employment to 250 men.

ABOUT A YEAR SINCE Rathbone, Sard & Co. of Albany, N. Y., introduced the Acorn radiator for coal to the trade as a new departure. They believed that the vast number of people who use soft coal as a fuel were not satisfied to be confined to the ordinary oak stove as their only choice for heating purposes; also that a more attractive stove, having the advantages of the best oak stoves in holding fire, would find a ready demand. Their anticipations were realized and many thousands were purchased. The Acorn radiator is practically an air tight oak stove surrounded by an ornamental cast jacket. It has the advantage of the intense radiation of heat from the sheet steel body, combined with the circulating power obtained through the double walls which are open from base to top, producing a strong current of heated air. The radiator can be mounted air tight, and we understand tests have proven its power to keep fire 48 hours with one hod of soft coal. A feature is that the outside jacket does not become discolored by heat. The manufacturers have issued a handsome circular illustrating the construction.

THE PHILLIPS GAS STOVE WORKS of 92 East Eighth street, Cincinnati, Ohio, are directing the attention of the trade to their line of gas ranges by means of a very neatly printed 24 page pamphlet, bound in colored paper covers. The goods are made under the name "Phillips," and are offered in a variety of sizes and styles. The top surface is provided with four boiling burners, one being double, the other single, while the oven is heated by means of two powerful burners with pilot light attachment. The baking oven is jacketed and has the company's combination asbestos and cast iron bottom. The oven is fitted with an automatic drop shelf operated by the opening and closing of the doors. The broiling and roasting oven is provided with a tin drip pan and pan grate. The burners used are operated by means of the manufacturers' improved cone seated valves. One form of the Phillips gas range is provided with water heating attachment, the heater being of brass and tested to 200 pounds pressure. It has two burners with separate valves and a pilot light attachment. The top plate of the heater has two griddle holes over which cooking can be done, while the water heater is in use. The manufacturers state that the heater can be attached to heaters Nos. 36 and 25. In addition to the line of gas ranges the pamphlet gives attention to the Gimper hot plate, the Phillips gas circulating water heater and the Phillips hot plates. Full directions are also presented for operating the Phillips gas range and reasons why these goods are the best.

"THE CHEERY WOOD FIRE" is the name of an attractive pamphlet of nearly 50 pages which reaches us from William Resor & Co. of Cincinnati, Ohio. The title indicates to some extent the contents of the pamphlet, although primarily the booklet is intended to introduce the company's new base heating hot air circulating wood parlor stove, to the planning and construction of which they have given a great deal of time and careful and extended study. The Monitor parlor base heater, for wood, is illustrated and described at considerable length, following which we find a large number of letters containing the opinions of some of those who have used or handled this stove.

GEORGE B. COBB & CO., 155 West 125th street, New York, are issuing a circular with the suggestion "Cook with gas." It shows how to save $4.57 per month according to their reckoning. One dollar is used for wood for kindling fires and $6 for a ton of coal a month, amounting to $7. By the use of a gas range the gas bill amounts to $2.43, leaving the above difference in favor of gas. This is a novel appeal in favor of the benefits of cooking with gas, and the balance of the circular is devoted to describing the comforts derived from the use of gas fuel and the different methods of cooking and performing kitchen service with it. A final sentence is, "We have on exhibition in our salesroom a large assortment of gas

stoves and ranges." They also make a specialty of the Welsbach light for reading, writing and sewing.

THE PLANT of the Coldwater Oil Stove Company, at Coldwater, Mich., is the subject of an interesting article which appears in a recent issue of one of the local papers. From it we learn that early in the winter the superintendent leased what is known as the Titus Foundry, in which to make the castings for the stoves, but finding the capacity inadequate for the purpose at once made improvements. A new cupola was put in, the old molding room torn down, and a new one 40 x 120 feet erected, in which 35 molders turn out daily the castings for 80 stoves. The nickel plating department is contained in a room 22 x 80 feet, giving employment to ten hands, under the management of William Mason. The mounting, packing and shipping are done in a three-story and basement building covering an area 40 x 100 feet. In the rear of the main building is another structure, 30 x 60 feet, where the oil tanks of the stoves are tested. The article states that thus far in the present year orders have been received for 6000 stoves from the Western trade alone, and it is expected before another winter the sales will aggregate 15,000 stoves.

CHARLES F. BARTLETT, Tenth and Filbert streets, Philadelphia, Pa., is sending out an eight-page circular of the London Café wrought steel gas range. The ranges are made with baking, broiling, roasting and warming ovens, and with burners for cooking on top of the range. One of the cuts shows the range with smoke canopy, hot water boiler and plumbing work as recently installed in a handsome residence in Philadelphia. The circular also shows Perfection gas grates and gas heaters.

S. T. PECKHAM, general sales manager of the Palermo Mica Company of 27 Peck Slip, New York, favors us with a sample of a unique business card which is employed by the concern that he represents. The card consists of a sheet of mica 2¾ x 6 inches in size, almost as clear as crystal, upon which in silver letters appears a request, addressed to stove manufacturers, not to forget the fact that by placing their orders for mica for the coming season with the Palermo Mica Company they are likely to save money for their customers.

THE CRAIG-REYNOLDS FOUNDRY COMPANY, Dayton, Ohio, are meeting with a very gratifying demand for their Triumph series of warm air furnaces. These goods embody a number of novel features and are proving so popular with the trade that the manufacturers are in daily receipt of flattering testimonials relative to the merits of the line.

THE LEXINGTON (KY.) STOVE COMPANY, it is reported, are building an extensive addition to their foundry.

ACCORDING to recent Western advices the works of the Thatcher Furnace Company at Argentine, Kan., were recently sold to Homer Smith of Topeka, and we understand it is the intention to incorporate a company with $100,000 capital for the purpose of pushing the business.

THE PORTSMOUTH STOVE & RANGE COMPANY, Portsmouth, Ohio, write us under recent date as follows: "So far this year we have run full every day, except Sunday, and have not taken a single holiday, and were even so wicked as to run the day John Robinson's circus was in town." The Model wrought steel range has had several new and important improvements added recently and the demand for it is such as to readily indicate the rapidly increasing popularity of this branch of their productions.

A PRESS DISPATCH from Fulton, Ill., published in a recent issue of the Chicago *Inter-Ocean*, states that the Mississippi Valley Stove Company have discovered a valuable bank of molding sand 15 miles east of Fulton. The bank is said to be worth thousands of dollars to the company, for the reason that they have hitherto been compelled to ship sand from the East at high freight rates. The sand is pronounced to be superior to any the company have ever used.

THE INDIANAPOLIS STOVE COMPANY of Indianapolis, Ind., have filed a notice of the reduction of their capital stock from $50,000 to $30,000.

THE PENINSULAR STOVE COMPANY, Detroit, send us a sample of their new trade-mark stickers, for which, we understand, there is a great demand among their customers. The stickers are in two sizes and of various colors. Dealers handling Peninsular goods consider the stickers excellent advertising matter, and agents are supplied with them in such quantities as may be required.

THE HOT AIR FURNACES made by the Kernan Furnace Company, Utica, N. Y., will be used in heating the new school building at West Winfield, N. Y.

PERRY STOVE COMPANY, 242 Water street, New York, are offering the trade a new double lamp stove which they call the Shoo Fly. It is furnished with either two or four hole extension top. They are also showing an extension top to be used in connection with their No. 2 Fire Fly gas hot plate, which practically gives another cooking hole.

THE FULLER-WARREN COMPANY are busy putting their new quarters in proper shape at 147 and 149 Lake street, Chicago. A great deal of remodeling was needed to adapt the building to the special requirements of the stove and furnace business. When everything is completed, however, they will be in very much better shape for handling their trade than at their former location. They now have three floors, each 40 x 165 feet, more than doubling their facilities. Their building being situated on the south side of the street, they have the advantage of north light in their offices and drafting room, which are in the front part of the sample floor. These are neatly fitted up with oak and plate glass half partitions. The sample room is well lighted by large windows in the rear as well as from the front. They have an independent elevator, instead of sharing in the use of one with other tenants. The floor above the sample room and offices is used for castings, and the top floor is fitted up as a furnace shop. Their facilities for the transaction of business are now of the best character, enabling them to meet all the requirements of their Chicago trade. They have a large alley in the rear for shipping, which is an important advantage over the cramped alley at their old place of business. The Fuller & Warren Warming & Ventilating Company have their offices here also.

THE DETROIT STOVE WORKS have issued a very tasteful illustrated circular announcing the removal of the Chicago branch to the new warehouse, 2921 to 2929 La Salle street, Chicago. An opening and reception took place on the 25th inst. from 9 a.m. to 10 p.m.

The Kind Hearted Farmer.

The prevailing dullness in the stove trade is keenly felt by the average traveling salesmen, and we sometimes hear of them resorting to queer expedients to increase sales and keep down expenses. The boys on the New England circuit are telling a story which has for its hero S. H. Plumb, who represents the Stamford Foundry Company of Stamford, Conn. It appears that Mr. Plumb found himself one afternoon recently in New Hartford, Conn., and having finished his business desired to go to Winsted, which is distant some eight miles. The train he intended to take was found upon inquiry to have been discontinued, so there was the prospect of remaining in the town for five or six weary hours. This was too much for the energetic spirit of our friend Plumb and he started off on foot for Winsted, carrying without effort a nice little order for Stamford ranges. The day was warm and the road dusty, and our traveler, after having covered four or five miles, was overtaken by a farmer with a team who invited him to ride, saying that he was going to Riverton, but he could carry Mr. Plumb along several miles and drop him at a point very near to Winsted. Footsore and by this time very dry and dusty, the stove man gratefully accepted the offer and proceeded along the road at a jog trot in more comfortable frame of mind. Cigars were lighted, and by way of showing his appreciation of the farmer's kindness, Plumb told him some late stories, including one which refers to the heating business and runs as follows:

Last fall, at the conclusion of the regular Saturday service in a nameless synagogue, the rabbi announced that about 40 tons of coal would be required to heat the church during the winter, and passed through the congregation with a box soliciting contributions. Almost every one dropped in something, save Mr. Isaacs, who winked in a knowing manner and refused to contribute. When the offering was counted the sum was found inadequate and the box was passed again. This time, also, Mr. Isaacs refused to give anything, and winked even more knowingly at the collector. The next day the rabbi met his parishioner and asked him why he refused to contribute toward buying the coal and why he winked in such a peculiar manner. Whereupon Mr. Isaacs lifted his hands, with palms extended, and said: "Say nottings. I'm onto you; the church is heated by steam."

Carried away by his own eloquence and the appreciation of his auditor, Mr. Plumb reached the confines of Riverton almost before he realized it, and then, thanking his benefactor, clambered down and set out on the road to Winsted, being assured that a comparatively short walk would carry him to his destination. He traveled on and on, covering perhaps 4 miles before he reached the end of his journey. Arriving at the hotel, he sat down to rest and commune with himself and incidentally to figure out just how much of a lift the countryman had given him. With the aid of a map and the assistance of the hotel clerk it was ascertained that he had been carried by the friendly farmer just 2½ miles off his regular track, and had covered exactly 1⅛ miles further than the air line distance between New Hartford and Winsted.

TRADE REPORT.

The Iron Market.

From Cleveland comes the news that lately quite a considerable quantity of Mesaba Ore from the Rockefeller interests has been placed at old figures, and that now sellers generally ask a slight advance.

The question of future increased cost is attracting growing attention among Western producers, and it is coupled with the fear that further labor troubles may develop. There is some uneasiness concerning the Lake Ore miners, and considerable uncertainty about the result of the coming negotiations between the Amalgamated Association and the union mills. As our correspondent in Cleveland telegraphs, the scales to be presented by the former will be a repetition of last year's demands. If that proves to be true there will be trouble.

An increasing number of mills have been forced into idleness through the Coal and Coke strikes, and the floods have interfered with the operations of others.

The feeling is growing general that active operations will soon begin in the Connellsville Coke region. Two of the Pittsburgh blast furnaces are getting ready to start next week. There is a growing conviction, too, that the decisive moment is coming in the Coal strike, and that work will be resumed at no distant date. But even if operations are again started it will take some time before the Coal trade settles down into its regular grooves.

No movement upward has taken place in Foundry Iron, although the growing scarcity of Southern Pig is bringing the situation very close to an actual advance.

Pig Iron.—The expected advance of freights from the Lehigh Valley to New England points, which is now $1.75, has not alone stimulated shipments but has also led to quite a number of sales, among them some to cover requirements for quite a considerable period. There is more inquiry also from the territory north of Albany, which has been so largely controlled by the Buffalo and valley furnaces, as the result of the stoppages of these furnaces through the Coke strike. Prices have not been affected, however, although Eastern Pennsylvania producers are more conservative in the sales for delivery during the second half of the year. We quote standard brands $12.50 @ $13 for No. 1; $11.25 @ $12 for No. 2, at tidewater. Southern Iron, same delivery, $11.50 @ $12.25 for No. 1; $10.50 @ $11 for No. 2; $10 @ $10.25 for No. 3; $10.25 @ $10.75 for No. 2 Soft, and $10.50 @ $11 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is $9 75 @ $10.25.

The two prominent features of the week in the Philadelphia Pig Iron market have been a scarcity in low grade Irons and a lighter demand for other descriptions. At $10 @ $10.25, delivered, a good deal of Iron would be taken; at $10.50 and upward buyers begin to pick and choose. As a rule holders claim to have firmer ideas, and while there is plenty of Iron at $10.50 @ $10.75 for Mill and Pipe purposes, it is not easy to force concessions, and the same may be said of No. 2 X at $11.50 @ $11.75, although, as usual, chance lots at less money are met with once in a while. General quotations for Philadelphia and equivalent points are about as follows:

Standard No. 1 Foundry X	$12.50 @ $12.75
Standard No. 2 Foundry X	11.25 @ 11.75
No. 2 Plain	10.75 @ 11.00
No. 1 Soft	11.50 @ 11.75
No. 2 Soft	10.75 @ 11.00

Our Chicago advices indicate an improvement in business. Better buying has recently developed, Local Iron being in very good demand, comparatively speaking. Shipping instructions are reported to be coming in at a lively rate on old contracts and new orders have been entered quite freely during the week. Negotiations are now pending for considerable quantities which are expected to be closed soon and will make the coming week a good one. Agents of Southern companies generally report business quiet, but it is known that orders ranging from 200 to 400 tons each have been placed and that one house in this way sold about 1500 tons since last report. Southern Soft Irons are now very scarce and the Silvery grade is practically out of the market. Foundries are running short of Coke, but every effort is being made to have them supplied and it is not expected that they will suffer seriously before the Coke strike ends. Quotations are given as follows for cash:

Lake Superior Charcoal	$15.00 @ $15.50
Local Coke Foundry, No. 1	11.25 @ 11.50
Local Coke Foundry, No. 2	10.50 @ 11.00
Local Coke Foundry, No. 3	10.00 @ 10.50
Local Scotch	11.50 @ 11.75
Ohio Strong Softeners No. 1	12.60 @ 13.50
Southern Silvery, No. 1	..... @ 11.50
Southern Silvery, No. 2	..... @ 11.00
Southern Coke, No. 2	10.00 @ 10.35
Southern Coke, No. 3	9.75 @ 10.00
Southern, No. 1, Soft	10.25 @ 10.50
Southern, No. 2, Soft	10.00 @ 10.25
Tennessee Charcoal, No. 1	15.00 @ 15.50
Tennessee Charcoal, No. 2	14.50 @ 15.00
Alabama Car Wheel	17.85 @ 18.00
Jackson County Silvery	15.00 @ 16.00
Other Ohio Silvery	12.50 @ 13.00

The Pig Iron market in Cincinnati is reported as showing a stronger undertone. There has bren more demand for Iron than can be readily supplied, and rather more than the usual proportion of Southern Iron selling, although the quantity is not large. There have been some small orders from the East, but the distribution of Iron in that district has been fairly liberal, considering the moderate quantity available. The main consumers of Irod are the Agricultural works, the Stove works and the Cast Pipe works, but the jobbing foundries in the aggregate are melting considerable Pig Iron, but not much in any individual instance. The Coal strike dominates the whole situation and greatly restricts trade. Quotations are unchanged, but are scarcely more than nominal, as follows:

Southern Coke, No. 1	$10.25 @ $10.50
Southern Coke, No. 2	9.25 @ 9.50
Southern Coke, No. 3	8.75 @ 9.00
Ohio Soft Stone Coal, No. 1	14.50 @ 15.50
Ohio Soft Stone Coal, No. 2	14.00 @ 14.50
Lake Superior Coke, No. 1	12.50 @ 13.00
Lake Superior Coke, No. 2	11.50 @ 12.00
Hanging Rock Charcoal, No. 1	17.00 @ 17.50
Hanging Rock Charcoal, No. 2	16.50 @ 17.00
Tennessee Charcoal, No. 1	13.00 @ 13.50
Tennessee Charcoal, No. 2	12.00 @ 12.50
Standard Southern Car Wheel	16.25 @ 17.00
Lake Superior Car Wheel and Malleable	16.25 @ 16.75

A strong feeling prevails in the St. Louis Pig Iron market. Stocks have been allowed to run down to a point which will take only a moderate demand to clean up entirely, and as a number of furnaces have closed down the conditions are ripe for a steady improvement in prices. Quotations have been advanced 25¢ ℔ ton and offers for future delivery are not being sought after. Sales during the week show decided improvement over the preceding week, and the market is in better shape than it has been for months. Quotations as follows for cash, f.o.b. cars St. Louis:

Southern Coke, No. 1 Foundry	$11.00 @ $11.25
Southern Coke, No. 2 Foundry	10.00 @ 10.25
Southern Coke, No. 3 Foundry	9.75 @ 10.00
Southern Car Wheel	17.00 @ 18.00
Lake Superior Car Wheel	16.25 @ 16.50
Ohio Softeners	14.25 @ 14.50

Metal Market.

Pig Tin.—Prices have been well maintained, notwithstanding lower London quotations and ample arrivals. The drop in the market which occurred toward the close of last week was succeeded in the early days of the current week by a recovery to about 20¢, net cash, for 5-ton and larger lots, small quantities of Straits Pig from store being quoted at 21¢ @ 21¼¢. There has been, however, no sign of a broader buying interest, and it is very doubtful if the average amount of Tin has been taken up by consumers and jobbers thus far this month. The arrivals since the 1st inst. aggregate 1305 tons, 560 tons of which have come in during the past few days.

Copper.—Home trade demand is extremely commonplace, purchases being on the most moderate scale, and the export outlet smaller and even poor. Supplies are said to be liberal, though not excessive. Prices, consequently, maintain about their former level, although rumors are current of substantial offerings at lower figures than are generally quoted. For small lots of Lake Ingot dealers ask 10¼¢ ℔ lb.

Sheet Copper.—No improvement is noted in the demand for manufactured Copper. Orders continue to be on a very conservative scale, while inquiries do not show any noteworthy increase. Prices are nominally maintained in accordance with the list, but concessions on desirable orders are not unknown.

Pig Lead.—Prices in the wholesale market have been exceptionally low this week, and the market generally has a very soft appearance. Consumers are very indifferent buyers, and business has been quite tame, with no immediately favorable outlook either in Pig or manufactured Lead. Jobbers ask 3¾¢ @ 4¢ ℔ lb for moderate quantities of American Pig, the bulk of business done favoring the lower figure.

Spelter.—Extremely low prices fail to stimulate business on home trade ac-

count. Purchases by Eastern consumers are on a very moderate scale, and offerings are entirely adequate to the present limited requirements. Jobbers' price for common Western Spelter is nominally 4¼¢ ℔ lb, but as low as 4¢ has been lately paid for small lots from store.

Antimony. — Business is fair and sufficient to keep jobbing prices steady at about 10¼¢ for Cookson's and 10¢ for Hallett's.

Nickel. — Prices are variable, with 45¢ @ 50¢ apparently a fair range on ordinary jobbing quantities.

Aluminum.—Manufacturers of Aluminum have issued a revised price list, as noted in another column. The following are current quotations: No. 1 Aluminum, over 98 % pure, 65¢ ℔ lb in small lots; 63¢ ℔ lb in 100-lb lots; 60¢ ℔ lb in ton lots; No. 2 grade, over 94 % pure, 60¢ ℔ lb in small lots; 55¢ ℔ lb in 100 lb lots, and 50¢ ℔ lb in ton lots.

Tin Plate.—The early portion of the week developed more business in Plates for both prompt and future delivery. Some substantial orders were placed by can makers, apparently to meet unexpected requirements, as the canning business is reported to have received quite a fillip on account of the fine, warm weather that prevailed in the first half of this month. The demand from the roofing trade, too, exhibited more life. Yet, in face of light stocks and scarcity in several lines of Plates, low prices continue to rule on business involving either spot goods or forward shipments, and evidence is wanting of any decided improvement in the tone of the market. The demand slacked off considerably toward the close of the week and relapsed into comparative dullness. Still there is enough of small business going around to keep the trade alive, although it is hardly up to the average for the season of the year. In the West a scarcity of Roofing Plates is noted, and it is reported that some of the Eastern Tin Plate manufacturers and dealers have lately received orders for large shipments to the West which have enabled them to clear out entire stocks of domestic Ternes. The fact that these Plates are nowhere over abundant seems to bear out this report.

A special London cable dispatch to *The Iron Age*, dated May 24, reports on the British market as follows: Tin Plate market is somewhat firmer, but divergent views of buyers and sellers on values hamper business. There is more inclination to contract for forward deliveries and buyers offer better rates than were current a short time ago. Inquiry from Canada is especially good, owing partly to reduction in ocean freight rates. Bessemer Cokes are about 1½ pence and ternes about 6 pence dearer. Swansea quotations are as follows:

Bessemer Cokes, 14 x 20	9/10½	@ 10/1½
Siemens Cokes, 14 x 20	...10/4½	@ 10/6
Ternes, double box	...18/3	@ ..
Charcoals	...11/	@ 13/

Sheet Iron.—Offerings of both Galvanized and Black Iron are said to be more limited, in view of a prospective restriction of output, owing to fuel scarcity. Galvanized Iron makers are feeling for better prices, and there is talk of an advance in rates in the near future. The consumptive demand continues, nevertheless, far less than the average for the present season, with no immediate prospect of expansion. Black Iron, also, inclines to stiffen, but stocks in dealers' hands are ample for the current rate of consumption. Black Plates for tinning are becoming quite scarce, and the mills producing this material are reported to be pushed to the utmost of their capacity to meet orders. The scarcity in Black Plates has already resulted in the partial or entire closing down of some of the Eastern Tin Plate works. Stocks of imported Black Plates are also down to a very low ebb, and it is commonly reported that they cannot be replenished to any extent within, at least, six weeks from now.

Chicago Report.

Scrap.—Dealers furnish the following list of buying prices, Chicago delivery:

	Per net ton.	Per lb
No. 1 Wrought Scrap	$7.00	....
Machinery Cast	6.00	....
Malleable Cast	5.00	....
Stove Plate (free of burnt)	4.00	....
Burnt Iron and Grate Bars	3.00	...
Sheet Iron and Hoops	2.00	...
Plow Steel and Breaking Stock	4.00	....
No. 2, such as Shovels, Hoes, &c	3.00	....
Old Boilers—whole (Iron)	3.00	....
" (Iron)—cut in single Sheets and Rings	5.00	....
Old Gas-Pipe and Boiler Tubes	5.00	....
Cast Borings	3.00	....
Turnings	4.00	....
Horseshoes	8.00	....
Copper Bottoms	....	5½¢
Copper Clips and Heavy	....	7 ¢
Heavy Brass	....	5¼¢
Light Brass	....	3 ¢
Pipe Lead	....	2¼¢
Tea Lead	....	2 ¢
Zinc	....	2 ¢
Rubber	....	3½¢

Anthracite.—This trade shows a decided change. Local shippers are very busy. They are not only having a good demand on account of the Soft Coal famine, but are also making heavy shipments to points in the West before freight rates advance. Carload lots of 12 net tons or over are quoted as follows:

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$5.00	$5 25
Milwaukee, Wis	5.00	5.25
Kansas City, Mo	8.20	8.45
Council Bluffs, Iowa	8.20	8.45
Lincoln, Neb	8.35	8.60
Sioux City, Iowa	8.20	8.45
Aberdeen, S. Dak	8.25	8.50
Dubuque, Iowa	6.30	6.55
Madison, Wis	6.50	6.75
St. Paul, Minn	7.50	7.75
Burlington, Iowa	6.50	6.75
Des Moines, Iowa	7.95	8.20
Davenport, Iowa	6.30	6.55
St. Joseph, Mo	8.20	8.45
Leavenworth, Kan	8.20	8.45
Omaha, Neb	8.20	8.45

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$8.00
Pueblo	8.00
Colorado Springs	8.00
Leadville	8.00
Cheyenne, Wyo	10.00
All points between Denver and Missouri River	8.85

BLACK FLAG STOVE POLISH COMPANY, Syracuse, N. Y., advise us that business has been better than they expected, the company not having shut down at all this winter or spring.

THE NEW YORK OFFICE of the McDaniel & Harvey Company of Philadelphia, C. McIntosh, sales agent, has been removed from 284 Pearl street to the Downing Building, 108 Fulton street, New York. The McDaniel & Harvey Company manufacture Harvey's Patent Clean Sheet Iron and are sole factors for the McCullough Iron Company.

CONDITION OF THE

Hardware Trade.

BUSINESS continues in moderate volume, but the fact that the trade are buying in very small quantities and more frequently than usual tends to keep jobbers and manufacturers relatively busy, although the aggregate of sales is not up to the average. Prices are without important change and the market on the whole is low and irregular. The effect of the strikes remains to be seen. This matter would be a much more disturbing factor if there were anything like a normal demand for the product of furnaces and mills. As it is, some of them can close without materially affecting the market. Collections continue sluggish.

Advices from Chicago.—The Shelf Hardware trade keeps up very well. Orders have been quite numerous the past few days, and the month now promises to be fully as good as March or April. Some stimulus to trade has been imparted by the notice of an advance in freight rates to the West. Shipments have been hurried forward on this account to a noticeable extent. Jobbers, however, hope that trade will hold up to about its present volume through the summer. They have done so much better than they expected that they are inspired to take an encouraging view of the future rather than discouraging. Staple goods are hardening on account of the advance in raw material, and higher prices are being made every two or three days. Roofing Plates are still very scarce, especially American brands, but prices are held down to old rates. The Heavy Hardware trade is quiet, not only in Iron and Steel, but in wagon and carriage stock. The recent cold snap which has injured vegetation is looked upon with some apprehension, as it may still further depress the demand from farming interests, on which the Heavy Hardware trade depends largely for its prosperity.

Notes on Prices.

Wire Nails.—The Wire Nail market continues in substantially the same condition as last week as to the volume of business, but has a decidedly firmer tone, as the manufacturers, in view of the increased cost of raw material and the uncertainty as to the supply of fuel, are naming higher prices. Most of the mills are adhering to $1.10 at mill, but it is thought that this figure can in some cases still be shaded slightly. In view of the situation there is a disposition also to take orders subject to prices ruling at the time of shipment, and another advance would not be surprising. Small lots from store in New York are held at $1.25 to $1.30.

Advices from Chicago.—Manufacturers' agents report some demand from large distributors, but buyers generally are holding off until the situation clears up. Manufacturers are advancing prices on account of the scarcity of fuel and higher values of raw material. They are quoting at last advices $1.10 at mill, or about $1.20, Chicago, but agents are now instructed to take orders subject to factory acceptance. Jobbers have made two advances during the week, and now quote $1.20 for small lots from stock with no reduction for carloads.

Cut Nails.—A somewhat firmer tone has been given to the Cut Nail market by the prevailing strikes and the fact that some of the mills at least are aus-

pending operations for a time. The price of Western Nails at mill is 90 to 95 cents, the latter quotation being in most cases insisted upon, but lower prices are made in competing for Eastern business. Eastern mills are quoting 95 cents to $1 for Nails delivered on dock in New York. Small lots from store in New York are still held at $1.10 to $1.15.

Advices from Chicago.—Inability to obtain Coal has caused the Lakeside Nail Company to shut down, but they have accumulated a stock of Nails which will enable them to supply the trade if the stoppage is not too long. Sales have been good during the week. Prices are very firm at 95 cents for 55 cent average. Small lots from stock are $1.05 to $1.10.

Barb Wire.—In sympathy with other products which are affected by the strikes, Barb Wire is somewhat stronger. The market is represented by the following quotations for Four-Point Galvanized, delivered at the points named: Pittsburgh, $2.05 to $2.15; Cleveland, $2.10 to $2.20; Cincinnati or Allentown, $2.15 to $2.25; Chicago or New York, $2.20 to $2.30.

Advices from Chicago.—An advance is expected on Barb Wire this week, owing to the scarcity of fuel at various works and higher prices of raw material. Inquiries have been fair, and in some instances large shipments have been made to the West in anticipation of higher freight rates. Factory lots of Galvanized Barb Wire are quoted at $2.20 to $2.25, Chicago, while small lots sell at $2.30 to $2.35, from stock. Painted Wire is held at 40 cents per hundred less than Galvanized.

Apple Parers.—We are in receipt of the following revised quotations on Apple Parers manufactured by C. E. Hudson, Leominster, Mass.:

	Per dozen.
Rocking Table	$5.50
Little Star	4 00
Daisy	3.50

Common Sense Lawn Sprinkler.—Stott Garden Implement Company, 136 Liberty street, New York, are manufacturing this Sprinkler. It is quoted to the trade at $12 per dozen net.

Refrigerator Fasteners — Bronze Metal Fasteners Nos. 4 and 5 have been put on the market by P. J. Conroy & Co., Paschall post office, Philadelphia. The No. 4 is sold at $8 per dozen and the No. 5 at $6 per dozen, subject to a discount of 40 per cent. to the trade.

The Premium Wringer.—The Colby Wringer Company, Montpelier, Vt., for whom Surpless, Dunn & Alder, 15 Murray street, New York, are direct representatives, have issued the following revised list of their Premium Wringer, the prices given being subject to a discount of 2 per cent. for cash:

	Per dozen.
No. 10, rolls 10 x 1¾ inches	$21
" 11, " 11 x 1¾ "	25
" 12, " 12 x 1¾ "	29

These Wringers are packed half a dozen in a case. The company's circular gives dimensions and weights of the different numbers.

Aluminum.—The Pittsburgh Reduction Company have issued a revised price-list of Aluminum, Ingot, Plate and Sheet, and Wire. The price of Plate and Sheet has been reduced 10¢ from the list printed in *The Metal Worker* of February 3, or to 80¢ base for ⅝-inch and heavier of a width wider than 3 inches and not wider than 12 inches. The Wire list has been entirely changed, as follows:

Aluminum Wire.—B. & S. Gauge.

Diameter B. & S. Gauge	Price per pound.
Nos. 9 to 14	$1.00
Nos. 16 and 17	1.05
Nos. 18 and 19	1.10
No. 20	1.25
No. 21	1.40
No. 22	1 50
No. 23	1.60
No. 24	1.75
No. 25	2.00
No. 26	2.25
No. 27	2.50

Glass.—There is no noticeable increase in the demand for Window Glass, while prices are firm and unchanged since our last report. The outlook is encouraging rather than otherwise, and additional pots are reported as having gone into operation during the past week. The opinion is expressed that tariff legislation will probably not influence the price of Glass during the present fire, and that foreign manufacturers will not import Glass largely while the action of Congress remains uncertain. New York and Pittsburgh markets are represented by the quotations for car lots of 85 per cent. discount for single, and 85 and 5 per cent. discount for double strength Glass. Small lots are quoted at 80 and 20 per cent. discount.

Old Metals.—Consumption is so restricted that the business doing in Old Metals has been of the narrowest character. Prices are weaker and the market generally dull and lacking interest. The following quotations represent about the price paid by dealers in this city for moderate lots:

Heavy Copper	℔ lb	6¾¢
Light and Tinned Copper	℔ lb	6¢
Heavy Brass	℔ lb	4½¢
Light Brass	℔ lb	3¾¢
Lead	℔ lb	2½¢
Tea Lead	℔ lb	2½¢
Zinc	℔ lb	2¢
No. 1 Pewter	℔ lb	12¢
No. 2 Pewter	℔ lb	6¢
Wrought Scrap Iron	℔ gross ton	$7.00
Heavy Cast Scrap	℔ gross ton	7.00
Stove Plate Scrap	℔ gross ton	3.50
Burnt Iron	℔ gross ton	2.50

Old Rags, Paper, &c.—The market is quiet, such business as is moving being chiefly in small lots. Paper mills, as a rule, are not making stock, but are running only to fill orders. When these are completed the mills stop; consequently the demand for Paper stock is limited. The prices paid for Old Rags, Paper, &c., in New York show little change, being about as follows:

No. 1 White Rags	℔ lb	3¼ @	3⅛¢
No. 2 White Rags	℔ lb	2 @	2¼¢
Mixed Rags	℔ lb	@	1¼¢
Blues and 3ds	℔ lb	1 @	1¼¢
Hard Sized White Shavings	℔ lb	2½ @	2⅝¢
No. 1 White Book Shavings	℔ lb	1¾ @	2⅛¢
No. 2 White Book Shavings	℔ lb	1⅛ @	1½¢
Light Book Shavings	℔ lb		1¼¢
No. 1 Mixed Shavings	℔ lb	1 @	1¼¢
No. 2 Mixed Shavings	℔ lb	¾ @	1 ¢
No. 1 Printed Books	℔ lb	1 @	1¼¢
Ordinary Mixed Books	℔ lb	½ @	¾¢
Newspapers	℔ lb		2-5¢
No. 1 Manila Paper	℔ lb	¾ @	1 ¢
No. 2 Manila Paper	℔ lb	⅞ @	¾¢
Bogus Paper	℔ lb		½¢
Common Paper	℔ lb		⅝¢
Straw Chips	℔ lb		½¢
Binders' Clippings	℔ lb		½¢
Jute Butts	℔ lb	1⅞ @	2 ¢
No. 1 Jute Bagging	℔ lb	1 @	1¼¢
Mixed Bagging	℔ lb	¾ @	1 ¢
No. 2 Bagging	℔ lb	½ @	¾¢

Catalogues of Heating Apparatus.

Examination of a considerable number of catalogues and circulars of hot water heating and steam heating apparatus recently received, and a comparison of these with a number of catalogues issued from ten to fifteen years ago, shows that recent publications of this class have undergone a very marked improvement. Not only in their general design and execution as regards printing and illustration is this improvement manifest, but in the literary style and greater accuracy of statement. The heating trade is evidently getting down to a scientific as well as practical basis. In modern catalogues principles are recognized and correctly stated that, in the majority of cases, a few years ago, would have been either wholly ignored or, if the attempt to state them were made, would have been very clumsily or inaccurately set forth.

Efficiency of Heating Surface.

The difference in efficiency of heating surface in boilers, consequent upon its position in relation to the direction of flow of the flame and heated gases generated on the grate and its greater or less exposnre to direct radiation from the burning fuel, together with the direction and rapidity of the currents of water flowing over the water side of the metal, is one of the principles now much more generally appreciated and understood than it was years ago. Mere extent of heating surface is no longer claimed by the more intelligent boiler manufacturers to indicate, of itself and independent of other considerations, superior economy of fuel or greater effectiveness in steaming than can be secured by a better design, though perhaps a smaller surface. The limiting conditions in the actual work of boilers are better understood and recognized. The proper relation of grate area to heating surface for high efficiency is much more generally observed.

Rating of Boilers and Hot Water Heaters.

But above all other indications of improvement in the publications of the heating trade, the disposition toward correct rating is, perhaps, the most notable and commendable. The heating trade has heretofore been wont to discount the ratings of boilers as given in catalogues, and perhaps will find it prudent to do so still, except in cases where individual experience has proved ratings to be reliable; but there now appears a tendency to rate boilers from actual test in average service. The exaggerations resulting from the guess work or enthusiasm of inventors, which some years ago taught steam and hot water men the necessity of extreme caution, are gradually disappearing from the statements of manufacturers, and much more reliable ratings are now generally made. Not that manufacturers have, as a class, willingly lent themselves to deception; on the contrary, they are reluctant, from principles of sound business policy, to overstate the efficiency of their boilers. But in some cases they have deceived themselves by improperly conducted experiments, and in others have accepted without due verification the statements of sanguine inventors; while the fear of underrating, and thus placing themselves at a disadvantage in the market, has often maintained boiler ratings at higher figures than experience has justified after the suspicion that the rating was too high has become almost a certainty.

Tests of New Boilers.

One reason for overrating has been the acceptance of results of tests of new and perfectly clean boilers, fired with the best fuel and worked under the most favorable conditions, as what may be relied upon in average actual service; or, if some allowance has been made for decrease of efficiency in actnal use, a too low estimate has been put upon this decrease. Very few heating boilers, as generally cared for and attended, will, on the average, work within 20 per cent. of their efficiency as tested when new, in the manner named. The popular rating of a boiler will finally come from what it will do in ordinary practice; and if its listed rating varies widely from this, the fact soon becomes well known in the trade, and any temporary advantage in sales obtained from an exaggerated rating is sure to be neutralized by a reaction upon the reputation of both the goods and the makers of such statements.

Influence of Electric Light on Plants.

An interesting series of experiments made by the Hon. W. W. Rawson of Arlington, England, to determine the influence of the electric light upon the growth of plants, are mentioned by *Invention*, a London journal. Mr. Rawson claims, as the result of his trials, that he gains five days in each of his three crops of lettuce—that is, two weeks in a season—by using the electric light in his greenhouses. He states, further, that the gain on one crop pays all the expenses of the electric lighting for the season, thus giving him the gain on the other two as clear profit. His attention was, we learn, first called to the usefulness of the light by the advance made in the growth at the ends of his greenhouse next the street and in the glare of an electric lamp. This was so marked that he introduced the light throughout his lettuce and cucumber houses with the most satisfactory results. Dr. Baily, another English experimenter in this line, states as the result of his own tests that the influence of the light is greatly modified by the interposition of a glass roof. Plants injured by a naked light were benefited by the protected light. He found that five hours' light per night at a distance of 12 feet hastened the maturity of vegetables a week or ten days, although it proved injurious to young plants.

The workingmen's associations are now memorializing Congress to take immediate action to restrict immigration. This is a good movement. When workingmen take this matter up in earnest Congress will doubtless discover some more effective way of discouraging undesirable immigration than has yet been devised. The tide continues to flow this way too strongly, notwithstanding the supposed check given to it by the depression in business here.

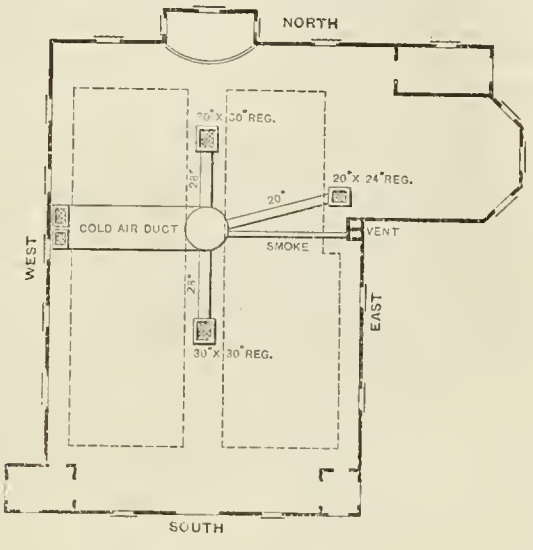
Some of the members of the Toronto Board of Trade are a queer lot, remarks the *Canadian Manufacturer*. A few weeks ago they passed strong resolutions urging the Dominion Government to take vigorous action looking to the building up of the Canadian pig iron industry, and later they send a deputation to Ottawa asking that pig iron be placed in the list of non-dutisble articles.

At the Watervliet, N. Y., arsenal gun shop on the morning of May 24, in the presence of a number of interested spectators, the jacket of a 12-inch gun was shrunk on the tube made for it. This is the fourteenth of 12 inch caliber that has been shrunk at the gun factory.

THE LETTER BOX.

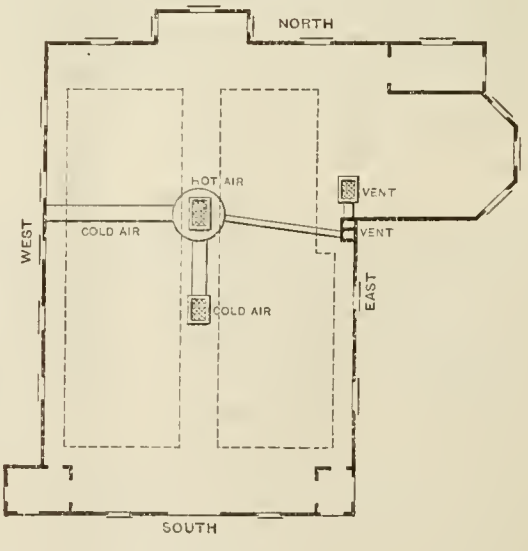
Wants a Better System.

From Cæsar, *Louisville.*—In *The Metal Worker* of May 12 I note an article from "W. S. G.," Penbrook, Pa. The only comment necessary is that "W. S. G." did not roast the architect sufficiently. The plan offered by the latter is well calculated to heat cellar to about 100° and auditorium 40° to 50°. As this is not desirable I offer the following with diagram of adjustment. I would place furnace as per diagram and take the hot air through a 30 x 36 face plate and border directly over furnace. Ten feet toward front of building I would place a register having three-fifths of the capacity of the hot air register and with pipe of three fifths of the capacity of the hot air pipe, connecting it to a pit under the furnace. The other two-fifths of the capacity of the hot air register I would use in a pipe connected to pit under furnace and run to outside air. I would place vent register as designated and give both pipe and register the same capacity as the vent flue. Let "W. S. G." use faces and borders only on this job. Such a plant will heat this building with 25 per cent. of the fuel that would be consumed in plan offered by the architect. If "W. S. G." had done the proper thing in this case he would have firmly passed the job and refused to figure on it. It is not well for a heating man to waste his time on such jobs as the one offered, in which such dense ignorance of the laws governing warm air heating is displayed. It is my experience that it requires a full lifetime of close application to learn the entirety and details of our business, yet we find some people who after four or five years' experience have mastered the details of every business. Comment is unnecessary.



Wants a Better System.—Plan by Cæsar.

From Hess, Snyder & Co., *Massillon, Ohio.*—Noticing in *The Metal Worker* of May 12 that "W. S. G." of Penbrook, Pa., wanted a plan for heating a new church, I send herewith a rough sketch showing the furnace in center of the building, using two 28-inch pipes with 30 x 30 registers in main aisle, 20-inch pipe with 20 x 27 register in side aisle next the small room on the east side. We would arrange this furnace so as to take both inside and outside air, using inside air when first firing until the church is warm, then using outside air. He failed to give size of ventilator, consequently we do not know what sized duct should be made. The ventilating duct should be the same capacity in square inches as the size of the foul air flue. The duct or ducts can run to register on the side of the chimney 2 inches above the floor, or they can be sunk in any part of the building and conducted to chimney through wood boxes. We should be pleased to have "W. S. G." write to us for a catalogue.



Wants a Better System.

Choked Water Backs.

From E. S. M., *Westminster, Md.*—In answer to "E. J. Y.," Regina, N. W. T., whose inquiry appears in *The Metal Worker* May 19, he may be interested in knowing that I have had the same trouble myself, and tried brass piping, thinking it might possibly help the matter, but it did no good. I then put the pipe where the hottest part of the fire would not strike it and have had no trouble with it since, which is over two years ago. It formerly filled up every month. The reason, I think, of the present relief is that the water got too hot and steamed, which it will not do if put where the coil will not be subjected to so high a heat. I know that the stoppage must have come from the water steaming, for the boiler would steam, and I think if "E. J. Y." examines his closely he will find that it also steams. Please ask him to publish the result of his experiments, as I would like to know if the same remedy would be effective with another coil.

From Swiped Joint.—A number of correspondents of *The Metal Worker* besides "E. J. Y.," whose complaint appeared May 19, find difficulty with choked water backs, which is a common trouble wherever hard water is used. A remedy for this might possibly be found in arranging the circulating pipes connecting the range boiler, and water back so that the same water would constantly flow through the back. Suppose the hot water pipe to boiler from back connected to top of boiler, then ran directly downward through center of boiler and out at bottom and thence to the range. This water would lose its heat while passing through the vertical pipe in boiler surrounded and in contact with colder water. The circulation would be constant and would convey the heat imparted to it in the back and lose it while passing through the boiler, thereby heating the water stored in the boiler doubtless

quite as well as though it mingled with it. There being no introduction of new or fresh water laden with earthy matter, no deposit would form in the back or pipes to close them. There would necessarily have to be some way provided to keep these pipes full at varying temperatures and permit sufficient water to escape to prevent bursting the pipes when expanded under boiling temperature. It is practical, I believe, and has been done successfully. A young man interested with me in business piped a boiler in some such way a year or more ago and it has given satisfactory results so far. Here there is no need of such an arrangement and hence it is not done. The vertical pipe inside boiler might and perhaps should be larger than the exterior ones—say 1½-inch. I suggest that your correspondents try it.

Paper Backed Corrugated Iron.

In submitting the query of Caswell & Moore to the readers of *The Metal Worker* last week a mistake was made in the address. Their correct address is Caswell & Moore, 237 Bridge street, Phenixville, Pa.

Making Solder.

From S. E. B., *Chicago.*—Will you please publish in *The Metal Worker* the best brands of tin and lead for making half and half solder? Am I correct in supposing that bar metal is purer than pig metal?

Answer.—Some good brands of lead are Omaha, Globe, Grant, Pueblo and Pennsylvania. Tin is known as Straits, Banca, Australian, Billiton and Lamb & Flag. It is not generally considered necessary to order either of these metals by the brand to get a good article, as the metal houses handle only such as are adapted to the requirements of their trade. Aside from the possibility of bar metal having been refined by an additional melting, it is improbable that it is any purer than the pigs from which it is made.

Front Wall Traps.

From L. J. S., *New York.*—I would like a little information on the use of a running trap at the front wall of a building. There has been a system of sewers put in in our town, increasing the amount of plumbing to be done. There are two firms here who do most of the work. One firm think it is proper to connect with the sewer and run a line of soil pipe through the house and up through the roof, having a trap in the main drain just inside the cellar wall. On the house side of the trap they run a 4-inch pipe to the outer air for the first fresh air inlet, commonly called a foot vent. The other firm think it is proper to connect with the sewer and run a line of soil pipe through the house up through the roof, omitting the tap and foot vent, saying that it is not necessary, as they do not do it in large cities such as Chicago and New York. I should like to know which system is proper.

Note.—We shall be glad to have our plumbing readers discuss the question of the use of a running trap and fresh air inlet. In looking over the ordinances of some 50 cities in different parts of the United States, we find that in two-thirds it is mandatory that a running trap with a fresh air pipe on the house side of it shall be used in all buildings. This is true of New York and Philadelphia. In a number of other cities no mention is made of the trap or foot vent. In Chicago a set of diagrams accompany their plumbing regulations, showing different methods of running the soil pipe and connecting with the sewer, and the use of a running trap and foot vent is not required. In Montreal the use of a running trap and foot vent is only permitted on special application to the authorities according to a set of regulations at hand. It is held by some that sewers and sewer air would be incapable of harm if the trap was omitted and additional ventilation was afforded by a pipe running from the main drain up above the roof inside of the front wall. Others hold that the foot vent coming up in the sidewalk is liable to stoppage by dirt or if not stopped it is dangerous to the passersby, because it discharges foul air, perhaps laden with disease germs, when any fixture in the house is flushed. Some think that the foot vent should be on the sewer side of the trap to protect the house and others think that it should run to the roof in all cases.

Remedying Defective Flues.

John Le Sauvage, 37 Duane street, New York, whose sign proclaims "defective flues a specialty," has had many interesting experiences with poor draft chimneys and smoky fire places. He says there are 101 reasons why chimneys fail to draw, and any one of them is sufficient to make trouble. In a large restaurant building eleven years ago the proprietor was annoyed by a lack of draft in his chimney, or, more properly speaking, smoke stack. Different chimney experts tried their skill in removing the cause of the trouble, but none was successful. The smoke stack was used in connection with two steam boilers, and in endeavoring to improve the draft one mechanic had used an exhaust fan on the roof in connection with it. This was arranged with a tight damper at the top of the smoke stack proper, operated by a chain running down through it to the basement. A tee connection was made at the side of the smoke stack and a round elbow then pointed down to connect with another round elbow running horizontally, into which the exhaust fan was placed. Beyond the fan another round elbow turned the pipe upward so as to discharge the air straight up. Even with this arrangement they were unable to get good results, and all due to the fact that where the horizontal pipe connected with the vertical shaft there was a contraction in the area of the flue, and the connection was made in such a way as to produce conflicting currents and undue friction. The smoke pipes running from the two boilers, which were equally distant from the flue, connected into a head at the base of the flue. All of this pipe was rectangular, and each of the smaller pipes was of ample capacity for the purpose and the head into which they connected was in proper proportion to their areas. On investigating it was found that the smoke stack was 30 inches in diameter and ran up through a square corrugated iron shaft as a means of protection against fire. To make the change at the base necessary for a good draft it would be necessary to take down the inside smoke stack, which was about 80 feet high, but an examination showed that the smoke pipe was so far weakened by corrosion that it would not stand taking down and a new pipe would therefore be required. On assuring the owner that the shaft could be made absolutely satisfactory, he decided to go to the expense of making the change suggested. A round elbow was made to connect with the square pipe and was continued square in shape well inside of the corrugated shaft. From the square end of this elbow the pipe gradually assumed a round form, and new round pipe was run to the top of the building. After the job was completed, which was done between Saturday night and Monday morning, fire was started in one of the steam boilers, and with the rapid draft now secured one boiler was amply capable of furnishing all the steam and heat required. The total cost of making the changes was $660, but the owner is well pleased with his expenditure and has stated that the saving in fuel alone will more than pay the cost in less than two years, and that one steam boiler is thus held in reserve for duty in case of accident or extra duty being necessary.

In another case a chimney ran up on the north side of a high building, and it was difficult at times to get an upward draft, particularly when there was a cold northwest wind, as the building was exposed on that side. On being called in to overcome the trouble, which was due to a cold chimney, Mr. Le Sauvage found that a new building would be erected next the chimney in a few months, and advised the owner to submit to the inconvenience in the mean time rather than go to the expense of insulating the flue. The new building was erected and the flue which previously was defective in operation gave excellent satisfaction. Another difficulty frequently found is due to the space in the chimney below where the pipe enters. In some cases no difficulty is caused by this space and at other times all that is needed to overcome the trouble is to stop off the chimney just below the pipe. A good way to stop off a chimney effectually yet not permanently is to insert through the pipe hole strips of heavy sheet iron long enough to wedge in the flue. Enough of them must be used to prevent ashes falling through. Then by filling in on top of the sheet iron with cinders and ashes an air tight stop is made. Such a stop can be easily removed when a stove is to be connected with the flue at a lower point. In a number of years practice Mr. Le Sauvage has accumulated a valuable fund of experience and is now seeking the flue that he cannot make operate.

Baltimore advices convey the report that a powerful association has been organized by leading capitalists, bankers and railroad officers in the South under the name of the Southern Immigration, Land & Title Company, the object of which is to develop and colonize Southern lands and generally to encourage and direct immigration and trade in the Southern States.

Continued dullness is reported as the prevailing feature in the dry goods trade throughout the country.

THE RETAIL STORE.

Electrical Devices as Hardware.

BY W. E. GILL.

It is only in recent years that electrical devices have come to be recognized as among the conveniences of the home and the necessities of the hotel, the business house, the bank and the factory. A few modern electrical inventions, notably among which are the telephone and the electric light, coupled with the energy and push of those engaged in the prosecution of electrical enterprises, have been largely instrumental in educating the public to a just appreciation of the value of electricity in domestic and business life. Electricity as applied to the liberal arts has become so extended in this country that a hotel without its guest call or a town without its electric railway, electric lights or the ubiquitous telephone would be considered commonplace indeed. Until recently electrical goods, with but few exceptions, have been handled and vended by manufacturers and dealers who made it their special business and who devoted their entire attention to the electrical industry. This was perhaps necessary while the goods were passing through their infantile period, and the same would apply to any like industry at the same stage. In many of its branches the electrical business will of necessity remain so, requiring as it does a special training to enable one to follow it successfully. There are, however, a great many articles and devices which are in constant demand almost everywhere, which have been so simplified as to render them staple.

WE WOULD CAUTION

the Hardware merchant who contemplates adding electrical goods to his already varied and diversified stock against going too far at the beginning. Location and the extent to which electrical enterprises are being carried on should have much to do with the choice of a line. Buy only from manufacturers or dealers of known and acknowledged reputation. There is, perhaps, no line of goods carried in stock by the Hardware merchant which he will be less able to criticise than his electrical stock. He must therefore rely upon the manufacturer or jobber giving him fair value in the goods they furnish.

THE INSTALLING

of electric railway and electric lighting plants, also fire alarm systems, is being generally carried on by companies organized for the promotion of some special system, the apparatus for which is usually patented or controlled by them. This work of necessity requires more or less scientific knowledge and men trained in special branches to perform the work. There is much, however, that comes within the scope of the Hardware merchant, and that could bear the same relation to his business that the tin shop and furnace department now do. The extent to which he should engage in electrical work of course depends upon existing conditions. In a locality where there are electrical fitters, the merchant might find it more profitable to carry limited stock of staple goods, so as to be able to supply the wants of the local trade, rather than to engage in competition with them. In this way he would avoid coming in contact with the consumer and avoid many of the petty annoyances incident to the electrical fitters' business and which arise from causes not under his control. All electrical devices depending upon a battery as the source of the electric current require

OCCASIONAL ATTENTION.

The battery must be supplied with water, and the elements when used up must be replaced by new ones. These simple matters are very apt to be neglected by the consumer, and when the electrical service fails, he invariably resorts to the fitter, who must needs make a trip to do what the consumer or his servant might have done had they been properly instructed. The merchant will indeed find more of these petty vexations to contend with in the electrical fitting department than in any other branch of his business. In the event of his adding an electrical fitting branch he should first acquaint himself with the simpler house appliances; the most common of which is the electric bell. There are manufacturers who have made a special study of the requirements of the Hardware trade in electrical devices for domestic and business purposes, and who put up and furnish in the most convenient form the goods which are in common demand everywhere, packing them in sets to suit most all ordinary requirements, and in such a form as to be readily stocked and handled from the shelf in the same manner that the merchant would handle a set of sliding door hangers or a set of store door handles and lock. The necessary directions are to be found packed with the sets, making it easy for a person of ordinary intelligence to put them in place in working order and to care for them without assistance from any one.

WHAT TO CARRY IN STOCK.

To start with, a merchant should place in his stock a few electric bell sets, such as are used for front doors and dining rooms in residences, for calls in office, banks, factories, stores, &c., selecting those sets which are packed with trimmings best suited to the requirements of his particular locality. These sets come packed with sufficient electrical wire for connecting up in any house of moderate size. In a great many instances, however, more wire will be required than is packed with the sets. It will, therefore, be desirable to carry some electrical wire in stock, such as is commonly used and known as No. 18 gauge annunciator, on spools of, say, ½ pound or 1 pound each, which sizes are regular; also ½-inch electricians' staples, in 2 ounce packages, packed one dozen packages in a box; and for repairs, some complete batteries and parts of batteries, such as battery zincs and sal ammoniac, in 5-ounce paper boxes or bags, one package being the quantity required for one complete charge for a single battery. A very simple, comprehensive and comparatively inexpensive sample for the salesroom may be made, using the wood box in which the set is packed, by screwing the cover to the back of the box, so as to extend above the box and mounting thereon the bell, wire and push, and placing the battery inside the box, all in full view; the battery then being charged and connected to the bell and push with the wire, and by pressing the push knob the bell will be made to ring, the current passing through the entire coil of wire. These electric bell sets should be on the shelf of every Hardware merchant, whether he does fitting or not, as they will meet the requirements of the average house builder or contractor in need of a simple electric bell, they being in the most convenient shape to handle and carry in stock. Should the merchant desire to engage in the

FITTING BUSINESS,

or carry stock for local fitters, he will find it convenient in addition to the sets to carry a limited line of electric pushes in bronze for out of doors, and wood for indoors; iron frame bells with 3-inch gongs for ordinary house and office use, and larger for barns, mills, factories, stores, &c., according to requirements; complete electric batteries and parts for same; No. 18 electrical wire on spools of ½ pound, 1 pound and 8 pounds each; ½-inch electricians' staples in 2-ounce, ½-pound or 1-pound packages; electric door connections for use on store entrance doors to indicate the opening and closing of the door; dining room pushes to be operated with the foot for calling a servant during meals, &c. The foregoing list comprises the goods which are in most common demand where electrical devices are used. There are other and kindred lines such as annunciators for hotels and residences and electric gas lighting apparatus which it would be manifestly unwise for the Hardware merchant to handle as a selling stock, and rather beyond his ability to handle as a fitter until he thoroughly understands how to install electric bells in their various applications. Regarding equipments and supplies for electric street railway and electric lighting plants, it would be impossible to here specify what goods might be advantageously handled, as local existing conditions and requirements and the knowledge of the merchant in these special branches of electricity will alone determine.

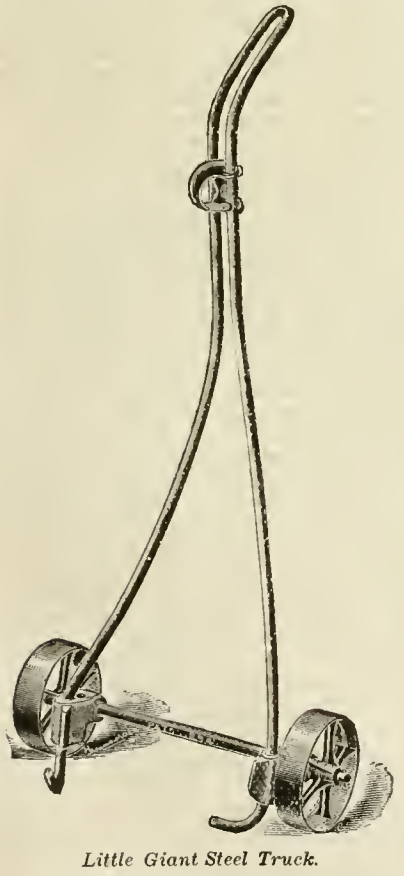
D. H. BURTIS of 27–29 East Washton street, Phenix, Arizona, is sending his friends in the trade a postal card, the back of which carries an advertisement of his line of specialties. The illustration with which it is embellished is unique in the extreme and self explanatory to residents of the section where Mr. Burtis does business. The line of goods which he carries includes stoves, ranges, pumps, tin, granite and copper ware, gasoline and oil stoves, sheet and corrugated iron, brass goods and fittings, and he is sole agent for the Blake steam pumps, Champion mowers, Johnson's self dump rake, Wilson's steel headers, Garlock steam packings, &c. Mr. Burtis states that he operates in connection with his store a thoroughly equipped tin and plumbing shop.

THE UNITED STATES GRAPHITE COMPANY of Saginaw, Mich., have received

some particularly fine lumps of graphite from their Santa Maria mine in Mexico. E. C. Ewen, manager of the company, states that owing to the extreme purity and consequent softness of the material, it is very hard to get it from the mine in large pieces. When it is considered that their mine is over 30 miles from the railroad, and the material, after being mined and sacked, is then hauled in ox carts over 30 miles of rough road, then loaded into a car and transported nearly 2500 miles to Saginaw, it is remarkable that the lumps reach that place in such good condition. Mr. Ewen spent a large part of the past winter at the mine, and it was under his supervision that the lumps were taken out and handled through to Saginaw. It is the intention of the company to carefully pack these lumps and distribute them among some of their friends and customers.

Little Giant Steel Truck.

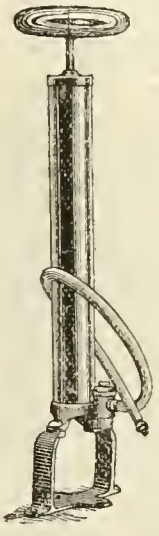
G. L. Van Namee Mfg. Company, Syracuse, N. Y., are offering the truck herewith shown. The truck is made entirely of metal, with wide tired wheels and well fitted bearings. It is provided with a self adjusting hook to secure the barrel at the top, also a clamp to prevent the axle from turning. The claim is made that the truck occupies but little space, and that while combining great strength it is in construction comparatively light, its total weight being 14 pounds. It is adapted for use in factories, stores, flour mills, &c., also for removing ash and garbage barrels. The above company are owners of the Little Giant Truck Company's plant.



Little Giant Steel Truck.

The Cyclone Pump.

The Davis & Stevens Mfg. Company, Seneca Falls, N. Y., are putting on the market the bicycle pump here shown. The pump cylinder measures 1¼ x 12 inches, nickel plated, provided with a turned brass plunger, ¼ inch thick, and with a cupped plunger leather so, it is stated, that it does not cut out the cylinder. The pump has a base of malleable iron, by which it may be held by the foot or screwed to the floor. The base is attached to the pump by bolts and nuts, and may be easily detached for close packing or when carrying the pump on the wheel. With the pump is furnished a small hose, with a coupling to fit all nipples, or larger hose with a thumb screw coupling to fit all tire valves without using any nipple The point is made by the manufacturers that the pump is strong, durable, convenient and cheap.



The Cyclone Pump.

The Dickson System of Heating and Ventilating School Buildings.

H. Sandmeyer & Co., Peoria, Ill., furnish us the following description of the Dickson system of heating and ventilating, as applied to school buildings.

The object of the inventor of this system is to circulate enough air in each schoolroom to give each pupil 2000 feet of air per hour without mechanical power. We make no pretensions to ventilating in summer only by opening windows and doors, and confine ourselves to the problem of winter ventilation; in other words, to heat and ventilate a schoolroom during that season of the year when fire is needed to warm the rooms and the doors and windows are kept closed.

To better describe the system we will consider it in connection with one room of a school building. We first ascertain how large a flue it will take to deliver a certain amount of air in the room in a given time heated to a given temperature in order to properly warm the room. Having thus provided a way to bring in the required number of cubic feet of air to properly heat, we must now construct a flue of suitable size to take out the same amount of air in the same time as is required to bring it in. The incoming air must not be heated to over 175° and the outgoing air must not be lower than 60°. The warm air must enter the room 8 feet above the floor and the foul air be taken out at the floor line. A flue to exhaust 100,000 feet of air per hour must be provided with heat in order to cause a rapid upward current at all times. In order to heat this vent flue economically and without any special appliances, we construct a heat and vent flue side by side, one side of the heat flue making one side of the vent flue. The material composing the partition which separates the heat and vent flue is sensitive to heat, such as copper, and the heat that passes through this partition is sufficient to keep the vent flue in operation at all times. To provide for ventilation when but little fire is required we provide an opening in the partition between the heat and vent flue, and by opening a damper all the heat from the heat flue is thrown into the vent flue, which causes a rapid upward current sufficient to ventilate in murky, bad weather, when but little fire is needed. By placing the heat and vent flues side by side we have what might be called an aspirating flue. By introducing heat at the bottom of the heat flue, with a proper cold air supply, we complete the system for one room.

If we have two or more rooms all that it is necessary is to simply duplicate the system for each additional room. Cold air rooms are provided in the basement of sufficient size to guarantee an abundant supply of air at all times. These rooms are supplied with air from large openings in the four different sides of the building. By the Dickson system of heating and ventilating a separate system is provided for each room, and the opening of a door or window in one room does not affect the heating and ventilating in any other room. By this system we can circulate 100,000 feet of air in each room per hour in any sized school building from one room up. Either steam or furnaces can be used to provide heat.

It would seem by this arrangement that it would require a large number of flues or chimneys, but such is not the case. True, it requires a heat and vent flue for each room, but the heat flue for the first floor makes a vent flue for the second floor, and the heat flue for the second floor makes a vent flue for the third floor. By this arrangement it only requires two chimneys for an 8 or a 12 room building. The vent flues must extend high enough above the apex of the roof so as not to be affected by the winds.

The Dickson system of ventilation is applicable to any kind of a building, and it has been introduced into schoolhouses of all kinds and opera houses and churches. The success of the system depends entirely upon the construction of the heat and vent flues. By the construction of the flues as here described, the required 2000 feet of air can be obtained without mechanical power.

European journals note that there is at present being established at Constantinowka, in South Russia, a large iron and steel works by a company formed in 1891, with a capital of $2,000,000, and known as the Forges du Donetz. The works will include a large Bessemer steel making plant, a rail rolling mill, foundry, forge and an engineering shop. The plant will, it is expected, be put in operation this year, and it is stated that orders have already been secured for the supply of 100,000 tons of rails to the Russian State railways during 1895-6-7.

The Italian Government has issued a circular warning its citizens against emigrating to the United States. It specially indicates the States of Pennsylvania, Maryland and Delaware as places where employment is difficult to procure.

Press Working of Sheet Metals.—VII.

BY OBERLIN SMITH.

Drawing Process.

The drawing process for sheet metals, by which deep cylindrical, conical and other cup shaped articles are made seamless from a flat sheet, is very different from the ordinary forming process used for shallow articles of like general nature; or, to speak more accurately, it is an amplification of the same, embodying certain new and entirely different principles. It is in its nature as interesting as it is unique. It is, moreover, a comparatively new process, probably dating back not more than 50 or 60 years. As near as I can learn it was first used in America by Mr. Grosjean of New York, who informs me that he thinks it was practiced in France over half a century ago. I am informed by Mr. Neidringhaus of St. Louis that the Prussian system of metal drawing, as it is called, was invented at Saarlouis, Rhenish Prussia, by the Strouvelle Brothers. It probably was not practiced on a large commercial scale in this country much earlier than 1866, and the first presses were made here by a Mr. Marchand, who had been employed by Mr. Grosjean and his associates.

This process is sometimes called "stamping," which term, however, is a misnomer, being improperly used to designate something which is the successor of the old stamping process, but entirely different from it. The latter was practiced for many years in the production of various seamless utensils, such as pans, bowls, plates, cups, &c., which were gradually coaxed down into shape, so to speak, by frequently repeated blows in a drop press.

Sheet metal drawing proper consists in so confining a certain outer zone of a blank which is to be drawn into a cup like shape between two rigid flat surfaces that the metal cannot wrinkle when pulled radially inward, which it attempts to do on account of the constantly decreasing circumference of its edge. In Fig. 231 is shown, in vertical axial section, a pair of combination push through drawing dies, such as are used for any plain cylindrical articles of medium depth, such as blacking boxes, can covers, clock cases, &c. They consist of a lower die, L, an upper die, U, and a drawing punch, P. They are shown with a cutting edge, *c c*, for which reason they are termed "combination dies"—as a sheet laid between them when U descends is first cut into a blank, as shown in two views in Fig. 232. They could, however, just as well be used for blanks already cut, the edge *c'* being in such case somewhat rounded off to facilitate easy entrance of the blank, and remaining to serve the purpose of a gauge merely. Where blanks rather than whole sheets are used, this gauge ring may be omitted and gauge pins substituted therefor, as in Fig. 240, at G G. In some kinds of work no gauges are used except the fingers, the top surface of the die being made of exactly the same size as the blank, to facilitate adjusting in this way.

The operation of these tools is as follows: The die U descends until the blank is firmly clamped between it and the die L, at which time U stops, the ram of press being provided with a proper dwell until the punch U has had time to descend, forming the work gradually to shape, as shown by its successive stages in Figs. 233, 234 and 235. The punch then ascends, the work being prevented from rising by the sharp, hard stripping edge S. The slight expansion of the top edge of the work by its own elasticity is usually sufficient to prevent its pulling up through the die again. In some cases, however, there is a tendency to do so, which can be prevented by three or more spring pawls inserted in the die at a point below S.

In all work of this kind it is important to vent the punch by an air hole of ample size, somewhat as shown in Fig. 243, as otherwise there is a tendency for the work to be drawn upward by suction. This vent has been omitted from the other engravings.

It is evident that if the die U remains stationary during the drawing of the work, the thickness of the flange thereof—that is to say, the flat part from the edge inward, which would be the rim of the inverted straw hat, so to speak, represented by Fig. 233—must remain of the same thickness as the original blank; and therefore the sides of the finished cup, Fig. 235, as well as its bottom, will remain of uniform thickness—that is, if there happens to be sufficient room between the sides of punch and die, so that the metal is not squeezed thinner. It may be said that the die U might be easily forced upward by the attempted thickening of the metal, the press springing open to allow for the same. This is true, but in practice the fact is that the thickness is changed but little. We have, therefore, in this process an interesting action taking place in the flange, viz., the throwing together—in blacksmith's parlance the "upsetting"—of the metal in a circumferential direction, while a pulling apart or stretching action is going on in a radial direction, and that to an amount, as experience proves, just about sufficient to balance it.

This action is very prettily shown by a graphic method. Four small dots arranged in a square are marked upon the blank, as in Fig. 232, and this square will be seen to have elongated itself radially and shortened itself circumferentially into the form of a diamond during different stages of the work, becoming a very elongated one at the last. The same action is shown in Figs. 249 and 250, which were photographed from an actual piece of drawn work about 5 inches in diameter by something over 2 inches deep, the blank for which was made of decorated tin, upon which were ruled cross lines, as shown. The new relations of these lines to each other upon the sides of the cylindrical cup tell the story far better than mere words can do.

There is evidently here an interesting instance of the cold flow of metals, the molecules thereof being obliged to move freely among themselves and arrange themselves in new positions. Such flow takes place, as experience proves, without weakening the metal, it merely growing somewhat harder in the same way as it would in any hammering or rolling operations. This subject has been previously treated by the writer in a lecture delivered by him before the Franklin Institute, entitled "Flow of Metals in the Drawing Process," which was published in the journal of the Institute for November, 1886. From it I quote the following paragraphs:

"Common instances of elastic flow may be found in the wonderful stretching of a piece of india rubber to perhaps ten times its normal length and its indignant return to exactly its original form, or in the bending or twisting of any wooden or metallic springs, &c.

"Instances of non-elastic flow are observed most frequently perhaps in connection with semi-solids, such as the clay upon the potter's wheel, the dough in the hands of the housewife, or the putty under the glazier's knife. In the apparently rigid solids such action is not popularly conceivable, but a little observation will show that the cold forging of a piece of iron, or, indeed, any bending or other permanent distortion of any piece of metal, could not occur without this flowing of its molecules among themselves. Such flowing is shown on the grandest scale known to our present experience (whatever may have happened in the mighty workshops of geological science) in the glaciers of the Alps, where great masses of solid ice flow slowly down their confining channels, changing their shape of cross section as needs be without being crushed or suffering any disintegration of their substance. This has been well described by Professor Tyndall, and it is, if I remember rightly, the same distinguished prowler about Nature's portals who tried the very interesting experiments regarding the flow of foreign objects through solid pitch without leaving any holes in it. I could not find the description of this experiment the other day in any books that I had at hand, but I believe it was as follows: A number of stones were placed upon the top of, and a number of corks underneath, a mass of pitch several inches thick, and abandoned to their fate. After several months of silent disappearance the corks arrived at the top and the stones at the bottom of the pitch, having floated and sunk respectively to their natural destinations.

"In looking for the flow of solids in the metallic arts it will be well to omit all hot processes as dealing with semi-fluids; but familiar examples of cold flow may be seen in wire drawing, tube drawing, cold rolling and hammering, lead pipe making, sheet metal spinning, &c.

"The first two mentioned are obviously analogous, about the only difference being that the tube is hollow, usually with a mandrel inside of it, while the wire is solid. Very similar to these operations, as respects the direction of flow of the particles of metal, is the reducing of a rod in grooved rolls, the chief difference being that the metal is coaxed along by friction, so to speak, instead of being pulled by its finished end. In hammering a bar the tensile stresses are entirely omitted and the action is wholly compressive, in a lateral direction, of course.

"In lead pipe making we have also an entirely compressive action, but one very different from that in the last named process. Here the lead is squirted out, as it were, much after the manner of a syringe, or a sausage stuffer, or one of those curious but really excellent squirting brick machines. . . ."

In Fig. 236 is shown a pair of conical drawing dies, the blank and successive stages of the work being shown respectively in Figs. 237, 238 and 239. Perspective views of finished work from dies of this sort are shown in Figs. 254 to 257, inclusive. Large sized dies of this kind are usually made of cast iron, without cutting edges, the gauging being done by hand as before mentioned. Where there is considerable taper to the work, it is removed by the hand of the operator grasping it inside and lifting it merely by friction as he pulls it upward and sidewise. The presses for

doing this are run very slowly, with continuous strokes, not stopping by the clutch with the ram in up position, as is usual with smaller presses. This is, of course, somewhat dangerous, as a man's arms would be crushed to a jelly were he to fail in keeping time with the motions of the press, even perhaps by the fraction of a second. It is rarely, however, that accidents of this sort happen.

cause it to stick fast and thus prevent a free delivery. In Figs. 258 and 259 are shown perspective views of a bowl and cup made in dies of this sort.

Depth of Drawing.

The depth of work attainable by the drawing process depends upon various conditions, among which are the kind and toughness of metal, the thickness thereof in proportion to the diameter, shallowness which are sometimes very provoking. Silver and gold are well adapted for deep work, but I cannot learn of the latter metal having been tried for anything as large as a churn. Recent experiments in the drawing of aluminum show it to be well adapted to the process. It is especially convenient on account of working without so frequent annealing as is necessary with brass, iron and steel, &c. Its tensile

PRESS WORKING OF SHEET METALS.

In Fig. 240 is shown a somewhat similar pair of dies, except that they are provided with a knockout, K, which rises at the proper time by a spring, or automatically by the motion of the press. Such knockouts are of course used in dies of either of the forms described and they are sometimes omitted in the bowl shaped work (see Fig. 242) made in the dies now under discussion. The necessity of such a knockout is of course dependent upon whether the work is steep enough at any place to the smoothness of the dies, &c. I have known small articles to be drawn at one operation from a good quality of one cross tin plate, which is about $\frac{1}{64}$ inch thick, to a depth equal to one-half their dismeter. Occasionally this proportion has reached two-thirds, as for instance a 3-inch round box 2 inches deep, &c.; but such would be an extreme case. Brass, German silver and copper can usually be drawn somewhat deeper, while zinc, on account of its tensile weakness, has limitations of strength, however, being somewhat less than brass, prevents so great a depth being obtained at one operation. In some experiments conducted by the writer in drawing cartridge shells of this metal, it showed itself most excellently adapted to the purpose, as it is also to all sorts of cooking utensils, which are drawn without difficulty in the ordinary forms. These, on account of their healthfulness, lightness and beauty, are, I think, destined to undergo an enormous development.

To quote again from the lecture before mentioned and referring to Fig. 231:

"A little study of the work which is being done in a die like this will show why a limit of depth is soon reached. The actual work consists, firstly, of molecular friction, or the causing to flow among themselves of the particles of metal in the flange before it turns the corner *d;* and secondly, in overcoming the friction between the upper and lower sides of the metal and the flat surfaces of the dies. If we imagine the part of the work which has become cylindrical to be a series of little ropes (forming the elements of the cylinder) which are attached to the punch by running across under the bottom of it and thence up its sides to the corner *d*, we will see that all the resistance offered in the flange is being overcome by the punch pulling these ropes downward over the corner *d*, it acting as a stationary pulley block. Hence if the united tensile strength of all these little ropes is great enough to overcome the resistance at its maximum, which is soon after the metal begins to flow, when the flange is at its widest, perfect work will be the result. If, however, there are not enough ropes to do this work, which is the case when the diameter at *s* is too small, the flange will not start to move, but the punch will simply go down and tear the bottom out of the work. Thus if we try for too great a depth relatively to the proposed diameter the work will be spoiled, because this means a wide flange and more resistance.

"It is evident that the little ropes spoken of will render more easily about a large corner than a small one, and that therefore a better result may be obtained by increasing the radius of the drawing corner *d*. If, however, this is carried too far, a considerable part of the flat holding surface of the lower die is lost, and a new evil arises, known as body wrinkles, which will be explained further on. Practically, for working tin plate, the radius of the corner *d* is made from $\frac{1}{8}$ to $\frac{1}{4}$ inch. The curvature of the corner *r* upon the punch also affects the result. If it is made perfectly sharp it tends to cut the metal which is pulled around it, and practically ought not to be less than $\frac{1}{16}$ inch radius. It is often much larger than this to suit shape of work desired, but if made very large causes the trouble of body wrinkles before referred to, on account of there being a certain zone of the blank which is unconfined by the flat holding surfaces."

In conical work like Fig. 239, or with approximately spherical shapes like Fig. 242, the blank is evidently unconfined over a certain annular zone lying between the lower corner of the punch *b* and upper corner of the lower die *d*, represented in general by the distance *b t*, Fig. 236. As the inner portions of the flange enter this zone and pass inward over its surface they are obliged to become smaller in circumference. There are here no clamping die surfaces to prevent wrinkles, which are therefore naturally formed and carried down into the conical portion of the work, as shown in Fig. 251, which was photographed from an actual wash bowl about 10 inches diameter just as it left the dies. These are known as "body wrinkles," in contradistinction to the flange wrinkles which sometimes occur when the upper and lower dies are not set tightly enough together. The former are usually removed by roller spinning in a special lathe. They are apt to occur in almost any of the utensils shown, except perhaps in work like the pie plate, Fig. 254. This is so shallow that they only barely begin to form, especially as the flange can be clamped very tightly in proportion to the depth, so that there is a tendency to pull out these incipient wrinkles by the actual stretching of the conical body of the work. There are other cases where wrinkles do not form objectionably on account of the work having very little taper, as in Fig. 257.

In Figs. 252 and 253 are shown common forms of cake pans, which illustrate body wrinkles when systematized and intended purposely to remain. These are the easiest made of all forms of deep work and do not require a holding die at all, being made without trouble in a single action press.

In conical work the difficulty in regard to getting enough tensile strength of metal to pull in the flange is often greater than in cylindrical, as the hypothetical little ropes spoken of in the above quotation are still fewer in number around the small circle whose perimeter is at *b* than they would be in the larger one at *t*, with a cylindrical punch. In general, therefore, work with a diameter at the bottom small in proportion to the extreme diameter of the flange is difficult to draw. This is shown in Figs. 246, 247 and 248, where there is a great deal of work going on in the vicinity of the flange in comparison to the amount of strength around the point of the punch to do the pulling.

Multiple Drawing.

It is evident that the resistance to be overcome in this process is due to both surface friction and molecular friction, or resistance to flow. With such conical articles as bowls, pans, &c., which do not require to be absolutely of uniform size, advantage is taken of this division of friction by drawing two or more together—sometimes as many as four. In such a case the surface friction is no greater for four than for one, as there are but two surfaces sliding against the dies. The molecular friction is, of course, four times as great as with one, but the sum of these frictions is obviously less than with one in proportion to the tensile strength of the work around the punch, which is as the number of thicknesses involved. There is, therefore, a considerable gain in strength, and deeper work may be made than where one is drawn at a time.

It is customary to remove the several thicknesses together from the press, sometimes spinning them in this condition, after which they easily drop apart. Obviously this could not well be done with cylindrical articles, as the difference in diameter would be too apparent, and, moreover, they could not be easily separated.

Referring again to the condition of the dies, it is very necessary, in order to avoid surface friction, that they be made exceedingly smooth and that the flat surfaces should be truly parallel, thus giving a space of uniform thickness between them. It is better to polish the clamping surfaces radially, rather than to leave a lathe polish upon them—a quite perceptible difference in preventing the metal from cracking sometimes appearing under such conditions.

Lubrication, which in certain cases is needed with various other kinds of dies referred to in this treatise, is always necessary to a more or less degree in drawn work. Sometimes oil is the best material — either applied occasionally to the dies or smeared in a thin coat over the sheets or blanks, or some of them. Soap suds works well for brass, and there are a variety of special preparations in the market. Zinc draws better if warmed as well as lubricated.

In Fig. 243 are shown a pair of triple action dies, and in Figs. 244 and 245 a blank and a finished box lid made therein. The action of these is the same as in Fig. 231, except that the punch has relatively a longer stroke and carries the work down on to the embossing matrix M, which is fastened at the bottom of a special bolster, B, made with an opening at the back through which the work is removed, instead of dropping downward in the ordinary way. The object of this is to emboss panels, beads, lettering or other devices upon the bottom of the work, and yet not be obliged to knock it up through the die, which is difficult with cylindrical shaped articles. The removal spoken of is usually performed by gravity, the press being set in an inclined position, so that the work may freely slide out. Sometimes, however, an automatic push out is provided. This is safer, as gravity sometimes fails to do its duty at a critical moment. Presses built especially for such work usually have a shorter ram stroke than usual, as room is not required between the dies for knockout work, and a relatively longer plunger stoke is needed, so that the die L may be made unusually thick (to give it strength where it bridges across the open space in bolster), and yet that the punch may descend far enough to reach through it and downward to M. The punch itself is of course unusually long.

It is evident that other shapes (looked at in top view) than round may be treated by the drawing process. In Fig. 276 is shown a rectangular sardine box, whose sides are straight and corners rounded to about $\frac{1}{4}$ inch radius. This is quite difficult to draw, because the action upon the metal at the corners is approximately the same as in drawing a cylindrical box with the same radius, or $1\frac{1}{2}$ inches in diameter, which is very small considering the depth attained. There is in such case a violent flow of metal, modified somewhat as it extends outward from a rounded corner into the two adjacent straight sides. The shape of the blank for work of this kind is rather peculiar, the corners being very much cut away in comparison with the sides to allow for the great radial stretch of metal at those points. The turning up of the sides along near the middle thereof is obviously a bending action merely. In Fig. 260 is shown an oblong pan with rounded ends, which is of somewhat the same nature as the box just mentioned.

In Fig. 261 is shown a grocers' scoop, which was drawn in an irregular die, the flange and a part of the body being trimmed off afterward.

In Fig. 262 is shown an ordinary wash boiler bottom, illustrating a case where no special blank is purposely prepared, but where the so-called "well" or depression is drawn in an ordinary rectangular sheet of metal, the holding surfaces of the dies of course being large enough to cover it. This system is sometimes used in producing certain tin toys, where the two halves of an animal are thus drawn and trimmed and then soldered together along the spinal column, &c.; also for various other similar shallow work. Its advantage is that no cutting dies are needed except for trimming off a part or all of the flange after drawing, which dies would have to be furnished in any case.

In Fig. 263 is shown a pair of combination spring drawing dies, so called, with the blank they cut shown in Fig. 264, and other stages of the work shown in Figs. 265 and 266. In Fig. 267 is shown a pair of similar dies arranged to work from a pre-cut blank, Fig. 268, and not supplied with cutting edges. The work is shown part way drawn in Fig. 269, and completed in Fig. 270.

Such dies are used in single action presses, the flange pressure being supplied by the drawing ring A, which is driven up and against die U by a powerful spring, S, working against a sliding plate, P, through the medium of a series of pins, B B. The stem D, together with its plate, P, nuts, N, spring, S, &c., form a portable device sometimes known as a "spring drawer," which can be screwed into any die adapted for it. Work done in this way is generally limited in depth to about 1 inch, as the pressure with anything much deeper would be so enormous as to waste a great deal of power, the descending ram having, of course, to compress the spring to the same number of pounds as are afterward given out by it upon its ascent.

Blank Dimensions.

In regard to the important matter of blank dimensions, I will again quote from my Franklin Institute lecture, as follows:

"It will naturally occur to the student of this subject that some easy tentative one. It is the surest, but in many cases the most expensive. It consists in cutting blanks of as near as possible the right size and shape by guess and trying them successively, modifying the shape of each to suit circumstances until the proper shape of drawn work is produced. For dies that do not cut this is not difficult, as the flat holding surfaces can be made plenty large enough, and whatever gauging arrangements are to guide the blank

PRESS WORKING OF SHEET METALS.

method is desirable for determining the diameter of the blank for any given piece of drawn work, especially if its dies are to cut, as cutting edges are expensive to make—and to alter if guessed at and made wrong at first. Aside from lucky guessing, somewhat guided, perhaps, by analogies from other approximately similar work that dies have been made for before, I have in my own practice used three principal methods to obtain this measurement of blank diameter.

"The first of these methods is the can be put on afterward when its correct proportions are decided upon. In cutting dies, the female cutting ring must be made separately, and left unfinished until the size and shape is ascertained. The male cutting ring, which forms part of the upper holding surface, must of course be made, but can be left plenty large enough until this trial has been completed.

"The second method referred to may be called the 'gravitative.' It depends for its accuracy upon the principle that the thickness of the metal in a piece of

drawn work is the same as it was in the original blank, which is in fact usually the case. My own method is to carefully weigh the sample piece of drawn work which is to be reproduced, and then, knowing the weight of 1 square inch of a piece of similar sheet metal of exactly the same measured thickness, to calculate the number of square inches necessary in the blank and make its diameter to suit this given area. This method can obviously be practiced only where a sample of the work is at hand and where the blanks are circular in form. Certain inaccuracies may arise in the practice of this method, where there are sundry beads, corrugations, &c., near the center of the piece of drawn work, which tend to let the metal stretch when the punch comes home in the die. Such action is properly embossing, rather than drawing, and stretches the metal thinner in certain places, which, of course, invalidates the accuracy of this system. It is, however, often useful for work whose contour is simple in form near the central portions, where a drawing action does not take place.

"The third method spoken of may be called the 'mensurative.' This, too, depends upon equal areas and upon the thickness of the metal remaining the same. In the case of plain cylindrical work a very simple formula which I have worked out for the purpose may be used. This is given in diagram A, equation 3, for a box or cup whose corner at m is sharp or nearly so, and in equation 6 for a round cornered box. The latter formula is not theoretically accurate as regards equal areas, but serves an excellent practical purpose where the corner is not of too large a curvature—say with a radius not more than one-fourth the depth of the cup. The diagram given in diagram A is a vertical axial section of a cylindrical box or cup, the same as was shown in Fig. 235. It is not worth while here to give the working out of the formulæ, as by a close inspection the figures will explain themselves.

"In diagram B is shown a method which I have devised for ascertaining the area of a piece of drawn work of irregular contour as regards its vertical section. This method is a graphic one, an exact profile of the work being drawn to scale of real size and this contour line being laid off from its axis outward into sections, each exactly $\frac{1}{8}$ inch long. From the centers of these sections, at the points marked r', r'', r''', &c., horizontal measurements are taken to the axis. These measurements, of course, represent various radii of the piece of drawn work in question. If we let the sum of them be called s, we then get the very simple formula given in equation 3. The reason that just $\frac{1}{8}$ inch was taken for the length of these segments of the contour line was that it happened to reduce the equation to the simple form given, while any other length would have made it more complicated. The principle here involved is obviously that of the area of any zone, being its width multiplied by its circumference at a point representing the center of gravity of its single cross section. The points marked r', r'', &c., are, of course, not accurately in the center of gravity of each of the little segments, but they are practically near enough so. The same principle occurs in this method as in the last mentioned one regarding places in the metal which will stretch thinner when formed to shape, like deep beads or other indentations. This trouble may be mostly neutralized, however, by bridging over them, so to speak, in making the contour line—that is, by running the latter across from point to point of the corrugations instead of following their curves wherever it is judged that stretching will take place. This amended contour is shown at n, n, diagram B, by dotted lines, and on it the segments should be laid out.

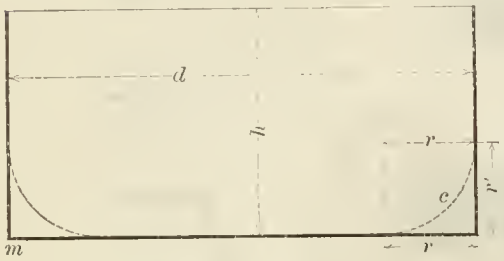
"In making drawn work whose top is elliptical instead of round, the formulæ above given may be used with some modifications.

"To do this, the ellipse is treated separately as regards its short and long axes, and values are inserted in the two equations which would be used for circles, which approximately coincide with the sides and ends of the ellipse at the termini of its respective axes.

"In making rectangular work with round corners, some idea of the shape of the blank may be obtained by treating the corners as belonging to a circle of the proper diameter, while the sides of the rectangle, which properly are not drawn at all, but only bent to shape, may be treated nearly by actual measurement, as in them very little stretching takes place. As regards the corners, however, the tentative method is the safest wherever it is possible to use it."

But few available data exist, or at any rate have been made public, regarding pressure per square inch necessary for holding the various kinds of metal between the surfaces of drawing dies. Neither do any proper testing instruments exist which will fill all the conditions present. These must be originated, and it is certainly very desirable that somebody should make a systematic series of experiments in connection with this matter, as well as in relation to the pressures in general that are used in sheet and bar metal work. Such experimenta, if properly performed, are tedious and expensive, but the writer hopes at some future time to be able to publish something definite upon the subject. Some fragmentary experimenta which he made a few years ago show about 200 pounds per square inch for holding the flange of a small milk pan, over 300 pounds upon a blacking box in one case and nearly 500 pounds in another. One such box, with less than $1\frac{1}{2}$ square inches of drawing surface, stood over 4000 pounds without the bottom being punched out, showing that in such shallow work there is often a great excess of flange strength. In general, for small tin plate work the pressure will probably run between 200 and 400 pounds.

The greatest possible plunger pressure that can be used in any given case without breakage is, of course, measurable by the tensile strength of the cross section of the work at the smallest diameter of the punch. This strength is obviously found by multiplying the circumference of the work at that point



Let (in inches):
d = diameter of cup.
h = hight of cup.
r = radius of corner.
c = arc of 90°, with radius r.
a = area bottom + sides.
a = area blank, also.
x = diameter blank is to be cut.

$$a = 0.785\,d^2 + \pi dh \quad (1.)$$

$$x = \sqrt{\frac{a}{0.785}} = \sqrt{\frac{0.785\,a^2 + \pi dh}{0.785}} \quad (2)$$

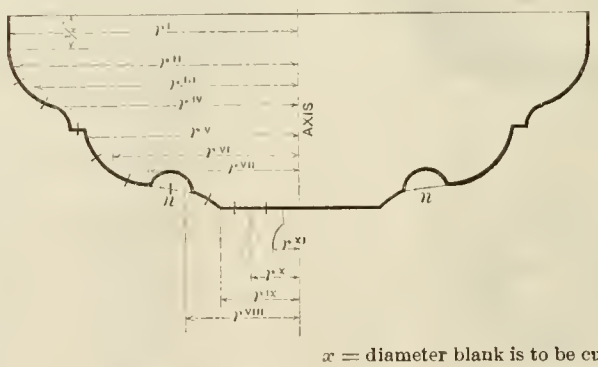
$$x = \sqrt{d^2 + 4dh}, \text{ for sharp cornered cup} \quad (3)$$

$$r' + r'' - c = \frac{r}{2} - \quad (4.)$$

$$2 = (r' + r'') - 2c = r - \quad (5.)$$

$$x = \left(\sqrt{d^2 + 4dh}\right) - r, \text{ about, for round cornered cup; with small corner, say where } r < \frac{h}{4} \quad (6.)$$

Diagram A.



Let (in inches):
r^{I}, r^{II}, r^{III}, r^{IV}, &c., = radii drawn to axis from centers of gravity of $\frac{1}{8}$ inch segments of contour line.
$s = r^{\mathrm{I}} + r^{\mathrm{II}} + r^{\mathrm{III}} + r^{\mathrm{IV}}$, &c.; that is, the sum of the radii.
a = area bottom + sides.
a = area blank, also.
a^1 = area of one zone whose average radius is r^{I}, r^{II}, r^{III}, &c.
x = diameter blank is to be cut.

$$a' = 2\,r^{\mathrm{I}}\,\pi\,\tfrac{1}{8} \quad (1.)$$

$$a = 2\,s\,\pi\,\tfrac{1}{8} = 0.785\,s \quad (2.)$$

$$x = \sqrt{\frac{a}{0.785}} = \sqrt{\frac{0.785s}{0.785}} = \sqrt{s} \quad (3)$$

Diagram B.

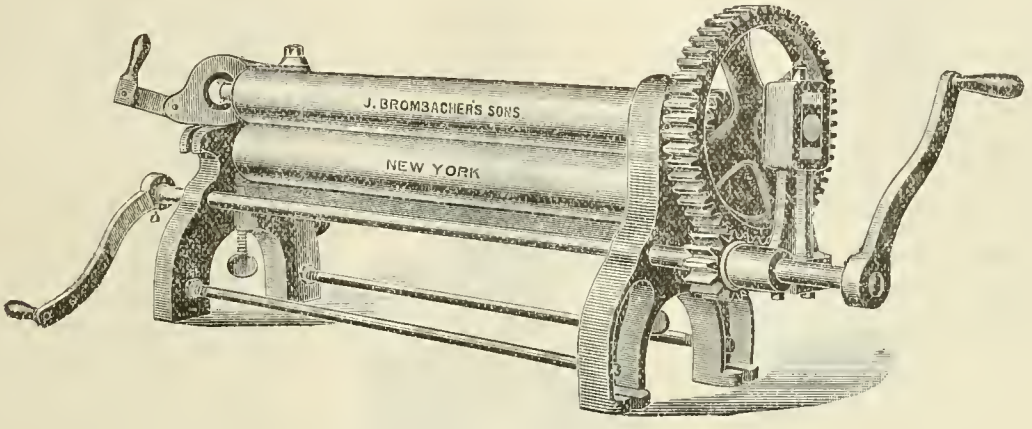
by the thickness of the metal and by its ultimate tensile strength per square inch. Or, P = SWT, our old formula with a new application.

In regard to the maximum limit of punch speed in drawing, we have again but few reliable data. The number of strokes per minute of drawing presses in commercial use vary from 10 to 200, with perhaps a rough general average of 50 or 60 per minute. At these rates the various metals used seem to flow properly without tearing fracture, although it may be that in some cases a slower speed would produce better results. Here, again, some systematic experiments are very desirable.

In regard to the kinds of presses used for such work, the general motion required has been before described. The plunger motion is almost always produced by means of a crank and pitman. The ram motion also is sometimes obtained this way in the case of certain kinds of shallow work, especially in brass factories. The dwell for the purpose of holding the flange of the work is obviously in such case but an approximate one, but if the metal is not too thin it seems to answer the purpose in the cases referred to. The majority of drawing presses are arranged to work the ram during its downward stroke by means of cams. These, if properly made with enormously strong shafts and rollers, with amply large bearing surfaces and of proper material, are very efficient and durable. The lifting of the ram is sometimes positively done by cams, and sometimes by non positive devices, such as springs and weights, or steam, air and water pistons, working in appropriate cylinders, &c. Any of these devices, if properly designed and adapted to the speed of the press, are sufficiently good for the purpose. In cases where the ram carrying the upper die (or blank holder, as it is often termed) is reversed, doing its clamping in an upward instead of a downward direction (as is the case in some large bottom slide presses), the direct action of gravity is used to return it. This gives excellent results, and an exceedingly simple construction can be obtained. Another device which has come into rather extensive use consists essentially of a system of toggle joints intervening the ram and the press frame, which hold the ram securely clamped, with its die against the flange of the work, without bringing a running pressure upon the shaft and roller bearings, as is the case with cam presses. This is obviously an advantage, but there is considerable difference of opinion among press makers and users as to whether any such advantage compensates for the additional complication required, especially after several years' wear has taken place. In general it may be said that any of the plans mentioned are practically good enough if properly designed.

Improved Slip Roll Pipe Former

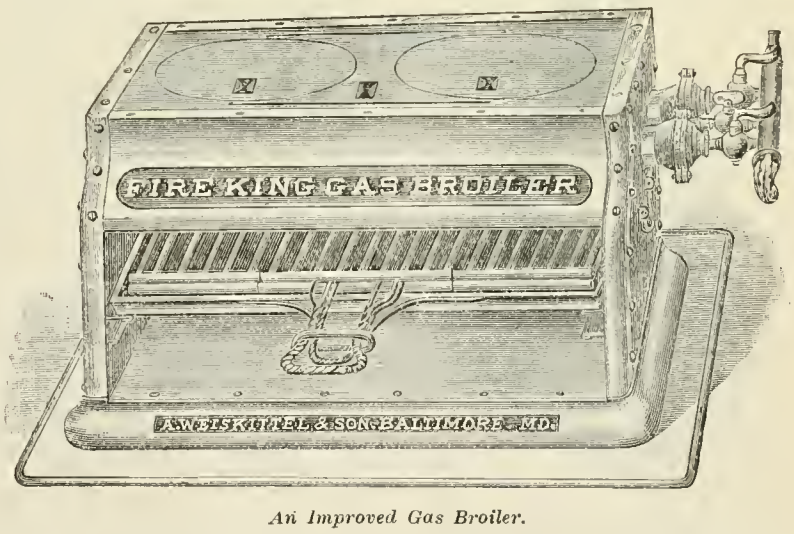
Jacob Brombacher's Sons, 30 Cliff street, New York, are bringing out an improved pipe former as here shown. The superior merits of this machine are pointed out by the manufacturers as follows: The upper or slip roll rests at the geared end in two fixed bearings, making it less springy than if hung on a screw. The other end of the slip roll is supported by a solid box, instead of an upper half box, thereby relieving the other two bearings of much undue strain. The slip roll bearing is removed from the shaft by sliding it sideways instead of swinging it upward, while the mechanism is so arranged that it at the same time lowers the under roll in order to allow the formed pipe to be removed. An advantage referred to is that this construction allows the workman to remain at one end of the former, instead of going to the other side, to lift the slip roll by means of a screw. The pinion shaft runs through both side frames and has a crank on each end, thus increasing the power. This machine can be supplied in sizes ranging from 3 to 4½ inches diameter of rolls, the length of which may be anything up to 60 inches. The machines are geared 4 to 1, and are capable of rolling up No. 12 gauge iron. They can be furnished for either hand or power.



Improved Slip Roll Pipe Former, Hand or Power.

An Improved Gas Broiler.

We present in the accompanying illustration a general view of an improved gas broiler which is being offered the trade under the name Fire King by A. Weiskittel & Son of Baltimore, Md. This broiler is of a size suitable for family use, being provided with two cooking holes on top, so that boiling and broiling may be done at the same time with the same burner. The manufacturers call attention to the fact that as the broiling is done beneath the flame the juices of the meat cannot drop into the fire and that the broiling is done quickly and uniformly. The claim is also made that meat cooked with the Fire King gas broiler retains all its juices and is more palatable than when broiled in the ordinary way. The sides, bottom and back of the broiler are made of heavy sheet steel, and the frames, base, &c., are highly polished. The broiler is 20 inches wide and 14 inches deep at the base, and measures 10¾ inches in hight. A wire broiler, 12 x 15 inches, and a drip pan accompany each broiler.



An Improved Gas Broiler.

The first American vessel to pass through the Manchester Ship Canal was the "Ambrose," with a cargo of oil from Philadelphia.

The gold coinage executed at the Philadelphia mint in the fiscal year ending June 30 will, it is said, be by far the heaviest in the history of that institution, approximating $80,000,000. The largest previous record was in 1861, when the gold coinage was $67,588,000.

PLUMBING and GAS FITTING.

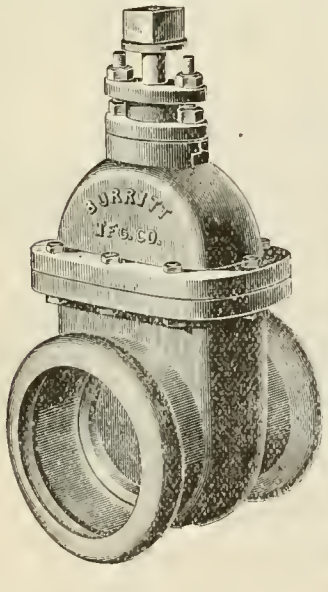
Plumbers' Convention Delegates.

The following delegates were elected to attend the national convention at the annual meeting of the Association of Master Plumbers of Brooklyn, N. Y.:

E. Heyward.	Wm. J. Gault.
Geo. Cummings.	Thos. H. Radcliffe.
Martin Fallon.	Walter Coyne.
R. J. Knox.	P. M. Moffatt.
G. B. Lewis.	C. F. Mentzinger.
J. W. Kelly.	Thos. Kelly.
Willis Gardner.	C. W. Evans.
J. J. Keenan.	B. McBride.
Wm. Eiermann.	H. M. Noble.
Jos. Zoll.	J. Quatlander.
O. O. Sawkins.	M. F. Gleason.
E. Macdonald.	Louis Haaf.
G. W. Smythe.	John H. Read.
Geo. Meng.	G. A. Smith.

Roller Wedge Gate Valve.

The illustrations shown herewith present a new gate valve recently put on the market by the Burritt Mfg. Company of the Havemeyer Building, 26 Cortlandt street, New York. The company have large works at Bound Brook, N. J., where these goods are manufactured. Fig. 1 shows the valve complete and Fig. 2 is a sectional view. The valve is the invention of O. W. Burritt, who for a number of years was superintendent of the Water Works Department of the city of Newark, N. J., and was devised as the result of the stems of the gate valves used on the city system fre-



Roller Wedge Gate Valve.—Fig. 1.—Showing Valve Complete.

quently breaking in the endeavor to open or close the valves. The valve consists of two disks operating in connection with an expansion wedge, securing a free and anti-friction movement by means of non-corrosive balls moving in inclined recesses between the wedge and disks. As the disks in common with the wedge move downward, the wedge is stopped by lugs cast in the shell, while the disks travel on and expand to a perfect shut off, it is said, regardless of sand or sediment collected in the bottom of the shell. In opening the gate the balls moving in the inclined recesses cause the wedge to yield at once on the motion of the screw, and the disks relieved of all forward pressure respond to the touch of the wrench. The shell of the valve is made with a smooth

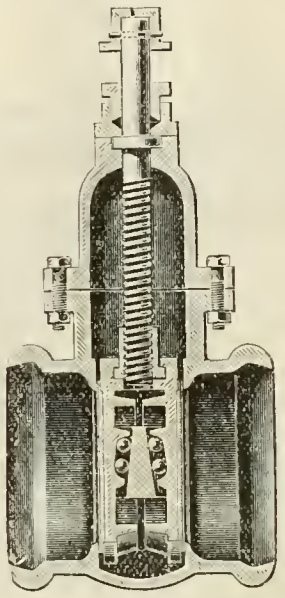


Fig. 2.—Sectional View.

face for the disks to shut against, and the disks are made with a babbitt metal face or brass face, according to the use to which they are put. For gas the valves are made with a brass stem, and brass is used on the faces of the disks instead of babbitt metal, which prevents the corrosion which otherwise would fasten the parts together. For steam the valve has a peculiar advantage in that it may be packed at the stem when the valve is open, as the top of the socket into which the screw is fastened is made conical and a recess is made in the top of the valve shell, so that the space around the stem is closed while the collar is removed and new packing put in. The ease with which the valve may be opened after it has been shut as tight as possible is a feature that has attracted the attention of all who have seen it. A large number of these valves have been sold to the Niagara Construction Company, Niagara, N. Y., and they have attracted the attention of water works engineers in cities where particularly heavy pressures are carried. The valves are now made in sizes from 2 to 12 inches and later will be made in all regular sizes up to 48 inches.

Smith & Webster.

About two years since, in the belief that there was room for another plumbers' supply house, the firm of Smith & Webster was formed in Chicago. The members of the new firm, Edward C. Smith and William M. Webster, both had a practical knowledge of the business, with years of experience in both manufacturing and selling plumbers' supplies. They started in a modest way, but met with encouraging success and added one department after another until it became necessary to secure larger quarters and acquire much greater manufacturing facilities. For this purpose they recently secured the building extending from 15 to 21 North Clinton street, Chicago, in which they concentrated their manufacturing and sales departments. They have pushed the work of equipping the factory as rapidly as possible, but still have important projects in hand which are in process of completion. The firm are highly gratified with the manner in which their enterprise is being recognized by the plumbers, whose patronage is steadily increasing and keeping pace with the improved facilities now enjoyed.

The building occupied is four stories in hight, with a fine basement. It originally consisted of a front and back building, separated by an area or court. This court is now inclosed and occupied by a two-story structure, of which the second story is used for office purposes, to which it is admirably suited. Side windows and skylights pour a flood of light into it, while from it all parts of the storeroom in front and the shipping room in the rear are visible. The storeroom and shipping room occupy the whole of the first floor. The storeroom is conveniently arranged with racks running transversely across the room, with a passage way down one side for customers. The shipping room in the rear opens on a roomy alley, and is also fitted with racks in which small wares are kept that are in greatest demand. The basement is used for the storage of pipe and fittings, bathtubs and other bulky or weighty goods. Machinery is about to be installed here for the manufacture of copper lined bathtubs. A portion of the basement is used for an engine room, in which is a 250 horse-power Reynolds Corliss engine, driving the machinery of the entire establishment. Near it is a dynamo, used for electric lighting and to supply current for the plating department.

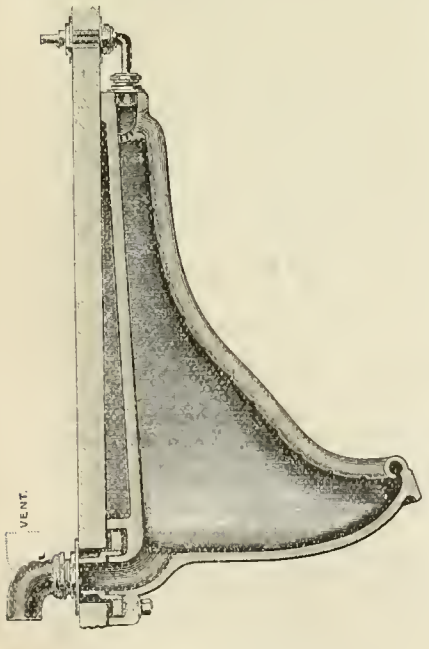
On the second and higher floors are the several manufacturing departments. One of these is the marble room, in which marble slabs imported direct from Italy are cut, shaped and polished for all purposes in connection with plumbing. Machinery plays an important part in this work. The most notable machine now in use here is Riehlé Bros.' countersinking machine. A pneumatic cutting machine for decorative work is now being added, and steam polishers are shortly to be introduced. In connection with the marble room is the department for manufacturing laundry tubs, which is fitted up with appliances for making tubs of slate, soapstone and granite. In the cabinet shop the firm make all their own wood work, such as rims for bathtubs, closet tanks, closet seats, &c. The lumber is bought in the rough and the goods are turned out complete, even the tanks being lined on the premises. A brass foundry is on the top floor, which is fitted with a brick pavement and otherwise rendered fire-

proof. Three furnaces are regularly run and capacity is afforded for three more. The firm thus turn out all their own brass castings and in an adjoining room finish them up on lathes and special machines, including polishers and buffers. Everything is carefully tested before it goes into stock to insure good work. Tables of the water pressure in all cities and towns are kept for constant reference, and whenever goods are ordered for points having very high pressure they are made accordingly and tested to withstand much greater strain. An extensive plating room is an adjunct of the brass foundry, in which plating is done in nickel, silver and copper. A well equipped forge and tool room enables repairs to be promptly made to machinery, tools to be quickly sharpened, and much machine work to be turned out exactly suited to the special requirements of the business. Two elevators are in constant service, one in front and the other in the rear of the factory.

The location selected is admirably suited to the business transacted by this firm. They are in the immediate vicinity of the lead pipe manufacturers and other makers of plumbers' supplies, close to railroad depots and warehouses, in the heart of the city and yet in a manufacturing district. They are thus near their city customers, near their base of supplies, and well situated for the out of town trade at the same time. They are jobbers as well as manufacturers and are thus prepared to furnish anything needed by a plumber.

Perfecto Urinal.

The illustration presented herewith shows the Perfecto urinal which is being put on the market by Fred Adee &



Perfecto Urinal.

Co., 90 Beekman street, New York. It is made of vitreous ware, which it is said will not craze, the material being of the same character all the way through and non-absorbent. It is said that this ware will stand the sudden heating and cooling with the contraction and expansion to which a urinal is subjected without crazing. The back of the urinal is inclined to facilitate the wash, and the flushing rim so arranged that all parts of the bowl are thoroughly scoured. The back is ground flat so as to fit close to the slab to which it is attached. The top connection is made by means of a flexible rubber union which provides for expansion and contraction. The waste outlet at the bottom is so arranged that all the pipe can be attached to the slab and the urinal connected at the last moment, and may be readily removed in case it is necessary to do so for repairs.

A Growing Dubuque Enterprise.

One of the busiest foundries in the city, says the Dubuque (Iowa) *Times*, and where from 90 to 100 skilled laborers are constantly employed, is the Excelsior Brass Works, whose goods are handled by all the leading jobbers of the country and the business of which has increased to such a magnitude that it can be justly rated as one of the leading industries. The gentlemen at the head of this business are all well-known citizens, and the new life and energy infused in the business but reflect their aggressive methods. The officers of the company are: President, A. W. Hosford; vice-president, A. E Kemler; secretary and treasurer, J. W. Waters; general manager, P. R. Martin. These gentlemen, together with P. H. Halpin, comprise the board of directors.

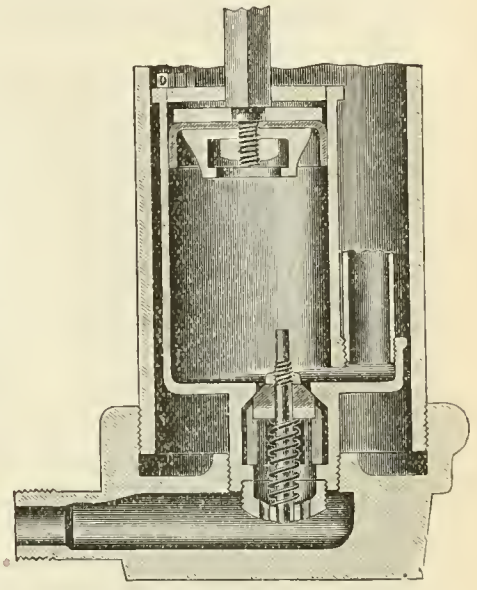
This company were incorporated in 1892 and in a manner succeeded to the business of Hodge & Waters, who had been in the business for some years, and with renewed capital and an infusion of new blood have enlarged the business and adopted new specialties, making their lines now complete and attractive. They manufacture a full line of plumbers' and steam fitters' supplies and make a specialty of brass castings and nickel plated goods.

Despite the fact that this company are comparatively young, the quality of their product has given them an enviable reputation wherever the goods have been sold. They keep in their employ three traveling salesmen who only look after the jobbing trade, and a first-class demand for their goods has been created in nearly all parts of the country. It may seem strange to be told that a Dubuque factory with but two years' opportunity to build has already secured a clientage that extends from the Atlantic to the Pacific, but such is the case with the Excelsior Brass Works, and their trade is reaching proportions which are highly gratifying to the management.

An innovation has been made at this factory which is at least novel and which frees it from the fear of coal strikes and permits a saving of a large amount in fuel alone. It is the only factory in Dubuque using crude oil for fuel and it is also used for foundry purposes. The manager reports that this substitute for coal works more than satisfactorily.

Type C Non-Wasting Hydrant

The cut presented herewith shows the principle and operating mechanism of the Type C Non Wasting hydrant made by the Ette & Henger Mfg. Company, St. Louis, Mo. The valve closes with the pressure as shown. It is not hung to the grating rod and is, it is claimed, perfectly reliable even without the spring. When the hydrant is closed the valve rod is raised 4 inches above the valve by weight and pressure, and raises the 2½-inch pump cup washer in waste chamber, which permits all the water in the hydrant to enter this chamber, and in opening the hydrant this water is forced back into the supply pipe before opening the supply valve. The waste chamber has an area of double the waste water. The advantages of this hydrant which are alluded to are that, in addition to saving water, it overcomes the annoyance of having water ooze out of the ground



Type C Non-Wasting Hydrant.

in yard, lawn or cellar, to freeze in winter and make mud in summer. There is no chance, furthermore, for the gases of the earth entering the valve at the waste hole and impregnating the water.

TRAPS AND VENTS.

JOHN FORD, 62 West Broadway, New York, makes a specialty of the plumbing repair business in the downtown section of the city, and does quite a large contracting business in the uptown residence section.

GEORGE E. THOMPSON, formerly of Providence, R I., has purchased the business of the Newtonville Heating & Plumbing Company, Newtonville, Mass., and will continue the contracts of the same.

THE DAVIS & STEVENS MFG. COMPANY, Seneca Falls, N. Y., issue circulars and advertising matter relating to some of the specialties of their manufacture. One is a card illustrating and giving the chief features of the Tornado air pump for drawing beer or other liquids under air pressure, filling tanks and inflating pneumatic tires or for any other purpose. A second similarly describes the Cyclone pump, especially adapted for inflating pneumatic tires. Another circular is devoted to pump leathers, of which they manufacture all sorts, as well as washers for hydraulic and sanitary pumps. Cuts are shown of some of these articles and description given.

ELDRETH ARNOLD, an Auburn, Maine, plumber, is moving into the basement of Goff Block, at Lewiston, Maine.

THE NEW BOARD OF PLUMBING EXAMINERS of Holyoke, Mass., met and organized last week with Dr. G. H. Smith, chairman of the board of health, as chairman. The other members of the board are City Engineer Walther as building inspector and Dennis O'Leary,

a plumber. Joseph Murray, inspector of plumbing, is to be secretary of the board. Notices of the formation of the board and of the State law regarding registration and securing licenses will be sent to the plumbers, and applications must be filed on or before June 15. The law requires all journeymen and master plumbers who were not engaged in the business before June 10, 1893, to pass an examination before local boards before they can be allowed to do any work under a license.

THROUGH the courtesy of Eli Wardell, plumbing inspector of the city of Taunton, Mass., we are in receipt of a copy of the ordinances for the regulation of plumbing in that city.

S. G. DUNBAR of West Medfield, Mass., has purchased the interest of C. N. Black in the plumbing business at Belfast, Maine. The new firm will be Mitchell & Dunbar, and Mr. Dunbar being experienced in steam heating, it will be made a new feature of their business.

FRANK I. LESSARD & Co., the McGregorville plumbing firm, have opened a sample room at 1268 Elm street, Manchester, N. H., which contains a full line of plumbing specialties, stoves, ranges and furnaces.

BENJAMIN C. SMITH, 275 Pearl street, New York, who introduced the French Pipe Cutting Machine 18 months ago, for cutting off sections of water mains and smaller sizes of pipe, reports a very satisfactory business in this tool. In addition to having been adopted by a number of water companies in America, orders have been received from Christiania, Norway; Santos, Brazil; Bombay, India; Mexico, &c. This implement, described at length in these columns at the time of its introduction, makes a clean cut on wrought or cast iron pipe in a few minutes with two men, saving the remaining portion of the pipe, heretofore ruined in smashing out, not to mention the avoidance of leaks often started 100 or 200 feet away from shock.

JOHN PIERCE, JR., 43 Beekman street, New York, representative of the William S. Cooper Brass Works, is showing one of their new aluminum sinks. The sink weighs about 10 pounds, is 14 x 22 inches in size and 6 inches deep. It is provided with one of their patent detachable overflow wastes. The overflow stands 4¼ inches high and fits tightly into the sink outlet by means of a special rubber band. When not in use the waste hangs in a fork placed in an offset in the sink out of the way. The sink is as smooth and bright in appearance as a piece of polished silver.

THE NEWARK BRASS COMPANY, 164 166 First street, Jersey City, N.J., make a specialty of brass work for plumbers.

E. ASPINALL, 98–100 Beekman street, New York, has recently enlarged and rearranged his sample room. With a fresh coat of paint and a fine line of imported sanitary earthenware, it presents many attractions to the plumber. His porcelain baths are one of his special features. White porcelain lavatories, with splash boards, soap cup and sponge holder in a variety of styles and sizes, make a handsome line of plumbing fixtures. He is showing a variety of styles of the Unitas water closet, one of which is furnished with a rim, making it convenient when used as a slop sink. Another one of his specialties is Aspinall's enamel for bathtubs. This is used on copper lined bathtubs after the tinning has worn off. It effectually prevents corrosion and is not affected by change of temperature.

W. F. MCCARTHY, formerly with the Kewanee Boiler Company, has accepted the position of traveling salesman with the J. L Mott Iron Works, 311 and 313 Wabash avenue, Chicago.

H. L. SMITH, Southbridge, Mass., plumber, is to remove from the Dresser House Block to the store now occupied by C. H. Ullrich, Elm street.

ROBERT MAITLAND, Clinton, Mass., plumber, has removed his business to 91 High street, under the American House.

CHARLES DESARMO is making arrangements to open a new plumbing establishment at Chillicothe, Ohio.

ALLIE HOOD of East Lempster bought the stock in trade of F. A. Clarke, Charleston, N. H. Mr. Hood is a practical plumber, having served a long apprenticeship to the trade and finishing in the New York school of trade. He will continue the business at Mr. Clarke's old stand in the Hoyt Building.

IN TRENTON, N. J., last week, Chancellor McGill dismissed a suit brought by local pottery firms to break the Sanitary Pottery Trust, known as the Trenton Potteries Company.

The Chicago Master Plumbers.

The Chicago Master Plumbers held their regular meeting at 197 East Madison street Monday evening, May 28. The following officers and members of the association were elected delegates to attend the convention of the Illinois Master Plumbers' Association, to be held at Peoria Thursday, June 7:

Paul Redieske, president.
Thos. Conway, vice-president.
Alex. W. Murray, financial and recording secretary.
P. Sanders, treasurer.
G. A. Larson, sergeant-at-arms.
T. P. Culloton, P. M. Murphy, C. C. Breyer, J. R. Breen, D. M. Quay, M. J. Carboy, } Members of Executive Committee.

The Apprenticeship Question.

The following extracts are taken from an interesting paper prepared by Jos. Shearlock of New Haven for the Connecticut State Association of Master Plumbers for their convention held at Hartford, Conn., February 15:

I have chosen three general heads under which to discuss this matter—viz.: 1. Is an apprenticeship system necessary? 2. Apprenticeship from the standpoint of the master plumber and the boy. 3. Will the end justify the means? To the first question, Is an apprenticeship necessary? I answer yes, and will give my reasons therefor. Labor saving machinery has not played a very important part in the plumbing trade, except in the manufacture of traps and some other minor detail. The hand work of the craft is now as it was 30 years ago, but the skillful plumber of to day must think as well as work, for the work done years ago, good as some of it undoubtedly was, must now be duplicated in all that is good and done with a clear understanding of sanitary methods that have come into existence within the last 15 years. That better work is being done now than ever before is due largely to the writing of plumbing specifications by experts in sanitary work, the requirements of which would be a revelation to some of the old time plumbers who have long since passed to their reward.

The plumber of to-day must be able to do more and must know more than is absolutely necessary in doing an ordinary day's work; he must know something about the general principles of hydraulics, the physics of gases, the circulation of water by the application of heat, &c., and must be prepared to answer offhand any question that a prospective customer or an inquisitive questioner may present.

In the midst of all these changes how fares it with the journeymen plumber—has he kept pace with the march of improvement or has he fallen behind in the race? First class work requires the services of first class workmen in its erection, but how many men have you in your employ that can be used on the best work, and how did these men attain the skill that enables them to do better work than the majority of our employees? The journeyman plumber who has the ability to erect first class work in a neat, substantial and satisfactory manner is nine times out of ten well along in the thirties and one who has been in constant practice from his nineteenth or twentieth year up to date. From this I draw the conclusion that constant practice and some study are absolutely necessary to the development of the really first-class workman. It is true that many of the best have reached perfection in the art without the aid of apprenticeship indentures, but what we want is more men who are able to do the best work, and this I think we can obtain only through the systematic and thorough methods that can be enforced by a well regulated apprenticeship system. Is it not true that fully 90 per cent. of all the journeymen plumbers have learned what they know about their every day work as follows?

A boy has reached the age of 18 years, when it becomes necessary that he must support himself and acquire the ability to earn his own living. His father or perhaps his mother has an idea that plumbing is a good trade for the boy to learn. If he finds a master plumber in need of more help a bargain will be struck and the boy set at work. All this is done with a present purpose only, and no ultimate result is aimed at. The boy will continue to work along until the master plumber has no further immediate use for him, and when that time arrives he is dropped to seek work elsewhere. By this time he is 20 years old perhaps, and still without the rudiments of his trade. He has a smattering, however, of the way work is ordinarily done, though he has obtained but little knowledge of how it ought to be done. He secures employment with another master plumber, to be again dropped when convenient for the employer to do so. By this time he is 21, has attained his majority, and if he has anything in him will see plainly that something must be done. He puts on a bold front and asks for work as a journeyman, well knowing that his ability will not warrant his employment as such, but being equally sure that in no other way can he obtain that practice he knows is essential to enable him to do good work. You all know how long he will work for you as a journeyman. Perhaps long enough to permanently injure your reputation for doing first-class work, perhaps not so long, but the result is the same, another discharge, followed by another and still

another attempt by the young man, until he has obtained that practice which will enable him to take his place among the rank and file of ordinary journeymen. . . .

If we are to take an apprentice let him be 16 years old. The first year of life in the shop will be largely taken up in learning the names of the tools, running errands, &c.; his time being worth but little we can pay him but little. The second year he will be well acquainted with details and ought to make a good helper; he is therefore worth more and you can therefore pay him higher wages. During the third year you will or should expect him to handle the tools himself, and toward the end of it he should be expected to do simple jobs under the eye of the employer or journeymen. The fourth year he should be in actual work on the building; he will make mistakes—we do—but he must be encouraged to learn in every way that is possible, and by the end of the fourth year should be able to do rough work, gas fitting, &c., in a satisfactory manner. The fifth and last year he should take part in the best work; it is almost certain that he will not have the necessary ability to do such work, but he should be encouraged to do his best. During the last three years he should receive wages in proportion to his ability. I would not recommend any arbitrary rate of wages. Pay every boy as you would every man —what he is worth.

The second thought—viz., apprenticeship from the standpoint of master and boy. Speaking to the master first, I would suggest that if you have any idea of taking an apprentice, ask and answer the following question: Do I want an apprentice or do I want a boy? Here is a distinction with a difference. To take an apprentice means there will be with you for five years a youth fast growing into manhood. During that five years his future will be to a great extent molded for good or evil. You are to see to it that he has opportunities to learn that which shall be in the future his sole means of support. Are you willing to take upon yourself this responsibility? If you are, let me advise you. Do you know anything about the boy. If not, find out something. Who are his parents? Are they willing to do what they can to encourage him to learn a trade and to co operate with you in your endeavor to make him a good workman and citizen? Now look the boy over as carefully as you would if you were about to hire a journeyman, or more carefully. Your experience with workmen will tell you if he has got the general make up necessary for the development of a good workman. If you are not perfectly satisfied in every way do not take him, but don't make him a drudge. Treat him as one with whom you have made an important contract, and carry out your part of it, no matter what the consequence may be.

Erastus Stebbins.

Erastus Stebbins, a well-known inventor of Chicopee, Mass., died suddenly on May 22. Mr. Stebbins was born in Winchester, N. H., in 1817 and went to Cabotville when about 25 years old. He began work in 1838 with the Ames Mfg. Company, Springfield, as a machinist, and then opened a small shop of his own just back of the factory, where he began the manufacture of faucets, water and molasses gates, &c. During the war his business was carried on where the Ames Sword Company's factory stands, and later it was moved to Taylor street, Springfield, until it was sold out about five years ago. It is now a prosperous institution at Brightwood. Since his retirement from business he devoted himself to the care of his large real estate interests. Mr. Stebbins was prominent in town affairs, having been a Selectman in 1871 and a representative in the Legislature twice. He was also an organizer and director of the First National Bank of Chicopee and had been a trustee of the savings bank for several years. He was an original charter member of the St. John's Lodge of Odd Fellows when it began in 1847 and had been connected with the body ever since. He was also a prominent member of the Chicopee Lodge of Masons. Mr. Stebbins married Elizabeth A. Dudley 50 years ago and besides the widow leaves four sons.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

JOHN P. SCHAFFER, 18 Wood street, Pittsburgh, Pa., manufacturer of Novelty ventilated wall pipe and specialist in hot air, hot water and steam heating, has recently completed a hot water plant for the new residence of J. L. Scott, Edwin street, Pittsburgh, Pa., and has about completed a similar plant for three large flats just erected by Fuhrer & Sons, on Butler street, in that city. Mr. Schaffer has also received the contract for the heating and ventilating of the new public school building at Avalon, Pa., which will require some 40 radiators, and has the contract for the hot water heating for the new residence of James Booth, on Boquet street, East End, Pittsburgh, which will require some 20 radiators. In all of the above work the Novelty hot water circulator has been used. In the heating of residences and buildings with hot air Mr. Schaffer has just completed the installation of plants in the residences of John Fite, Fred. Sauer and Henry Avermann, all in the East End, Pittsburgh, and also in the new building of Leak & Green, Shields Station, P., F. W. & C. Ry. He has also received contracts for heating with hot air the new public school building in the Fourteenth Ward, Allegheny, Pa., and the residences of A. W. Vanata, Greenfield, Pa.; Geo. Schaffer, East End, Pittsburgh; S. C. Beeson, McKees Rocks, Pa., and A. J. Demmler, at Demmler, Pa. In all of the above work the Novelty ventilated wall pipe is being used exclusively. Mr. Schaffer reports considerable new work in prospect, which naturally makes the outlook for the future very encouraging.

SEALED PROPOSALS will be received by the Board of Trustees for the Improvement of the Court House, at their office in Canton, Ohio, until Tuesday, June 5, for the sewerage, plumbing and gas fitting of the entire court house.

SHACKELFORD & GENTRY of Richmond, Ky., have been awarded the contract for heating the new school building about to be erected in that city, the price obtained being $1200. They will use the Triumph King furnace, manufactured by the Craig-Reynolds Foundry Company of Dayton, Ohio.

GODLEY & MORRIS have the contract for an extensive job of plumbing for August Straus, at his residence on Forest street, Oberlin, Ill.

THE BOARD OF EDUCATION of Newark, N. J., have awarded the plumbing and repairing contract for the coming year to the Edward Dunn Company.

AMONG the contracts recently taken for steam heating by Kehm & Mertz, 289 Kinzie street, Chicago, can be mentioned the following: Women's Memorial Chapel, Penn and Veddar streets; 16-room school building, Washburne avenue and Robey street; residence of J. T. Quinn, Oakdale and Lake View avenues.

DAVID HORN of York, Pa., has secured a contract for warming and ventilating a 12-room school building in that town, and will use four Economy combination steam and air heaters. The plant is to be installed after plans prepared by the J. F. Pease Furnace Company.

THE MORGAN STEAM HEATING COMPANY of Cleveland, Ohio, have the contract for heating the new residence and office of Dr. Hobson on Prospect street with a hot water plant, and will use a battery of two Economy hot water heaters, No. 118.

SEALED BIDS will be received by F. P. Dixon, chairman of the Board of Education at St. Charles, Minn., until June 11, to furnish with heating apparatus the annex to the present school house.

COOK & CHICK, 253 and 255 Kinzie street, Chicago, are to overhaul the steam fitting in the flat building of L. D. Hammond, Ellis avenue and Forty-third street. They will also install a hot water heating plant in the residence of Edward Lister, 23 Greenwood avenue.

SULLIVAN & HAYNES, Jefferson, N. Y., have been awarded the contract to place the new heaters in the County House. Their bid was $1166.50.

THE CONTRACT for plumbing and steam heating the new court house building at Snow Hill, Md., has been awarded to Harry A. Miller of Wilmington, Del.

THE BRIDGEPORT STEAM HEATING COMPANY, Bridgeport, Conn., have secured the contract for placing a steam heating apparatus in the new office building of the Bridgeport Copper Company.

THE THEO. JACOBS COMPANY, 72 and 74 Market street, Chicago, have the contract for hot water heating in the residence of H. R. Wilson, 4332 Grand Boulevard.

PHILIP F. CONROY, Newport, R. I., has been awarded the contract for heating the new Industrial School in that city. His bid was $1487.

WM. H. LINCOLN, chairman of Selectmen, Brookline, Mass., will receive bids till June 11 for the heating and for the plumbing of the new High School building at Brookline.

SEALED BIDS will be received by J. J. McIntire, Osceola, Iowa, up to June 5, for the construction and erection of steam heating apparatus in the two story High School building about to be erected in the independent school district of Osceola, Clarke County, Iowa.

E. BAGGOT, 169 and 171 Adams street, Chicago, has the contract for plumbing and gas fitting in the residence of J. W. Stevens, Grand Boulevard, near Forty-second street.

. The Klatte method of rolling weldless chain has been introduced at the Germania Works, Neuwied, Germany.

ROOFING AND CORNICE.

Hayes C. E. Metallic Lathing.

George Hayes, 71 Eighth avenue, New York City, whose inventions in connection with architectural engineering are well known, has just brought out a new invention in metallic lathing, to be known as the Hayes C. E. (corrugated expanded) lathing, of which an illustration showing front view is presented herewith. This lathing has been patented in the United States and foreign countries.

Front View of the Hayes C. E Metallic Lathing.

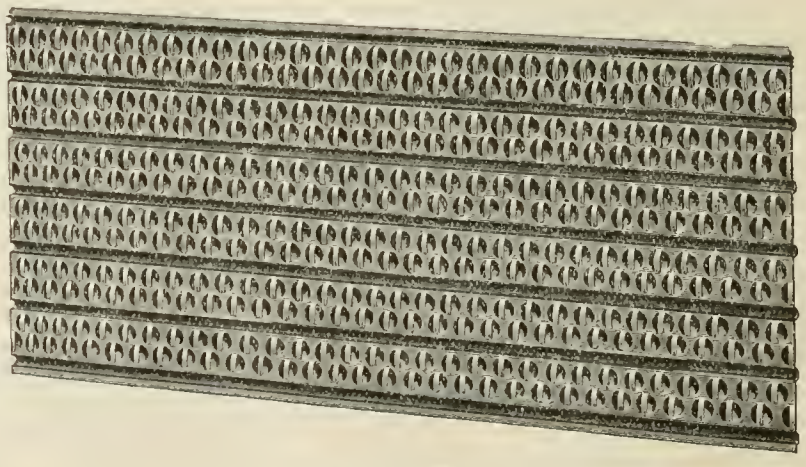
The system is described as follows: He takes a sheet metal blank, say 30 x 96 inches, corrugates the same and otherwise forces it out of plane, after making, at prescribed intervals over its entire surface, certain slits or openings which, in the process of manufacture, are expanded, the outlines thereof being double arc lines, one on each side of the chord, forming lanceolated openings, their axes representing the true length of the metal employed. These apertures are arranged longitudinally, occurring in the depressions, while upon the elevations are formed a series of arched loops having a concave crown. The depressions and elevations form the corrugated surface, while the loops give the appearance of transverse corrugations. Strange as it may appear, and in seeming conflict with the inflexible law of geometery, this divergence from the plane of the sheet and from the axis of the openings does not, it is claimed, detract from the original flat sheet, either in its length, width or thickness, producing a sheet of finished lathing 30 x 96 inches. Moreover, it is pointed out that a sheet of metal lathing so corrugated partakes of all the strength and rigidity of an ordinary corrugated sheet, and when reinforced with plastic material becomes as substantial as a slab of stone. Among the advantages claimed for this lathing are that it is easily handled and applied; that there are no cutting edges or points to injure the hands; that it is readily cut to any size with an ordinary pair of tinsmiths' shears and can be readily bent into any form. It possesses a most perfect clinch or bond for the mortar, can be plastered on both sides and does not permit a free escape or waste of mortar.

The use of this material for inexpensive fire proof construction is alluded to, and it is pointed out that any timber constructed building may be rendered practically imcombustible by its use, conjoined with that of plaster. It is recommended particularly for the inclosing of elevator and dumb waiter shafts, and for partitions, where a double plastered face is made from 1 to 2 inches in thickness, thus effecting a material saving in floor space.

The Indiana Paint & Roofing Company, 42 West Broadway, New York, make a specialty of sheathing papers and silica paints for roofing. They are issuing at the present time an attractive little four page booklet, "To Men of Real Estate," that is well calculated to direct the attention of all who have anything to do with roofs or roofing to their roofing materials.

The Kansas City Metal Lath.

The Kansas City Metal Roofing & Corrugating Company, Kansas City, Mo., are placing on the market the Kansas City metal lath, which is claimed to be exceptionally stiff. The lath is made of No. 29 United States gauge sheet steel in sheets 27 x 48 inches. It has half round ribs or corrugations 3¼ inches apart, which run the full length of the sheet, thereby securing great strength and stiffness. Between these ribs slots are arranged with depressed lips, forming an incline upon which the mortar easily slides through to the back, where it forms a perfect lock or clinch around the strap between the depressed lips, thus avoiding any waste of plaster, and at the same time, it is said, the plaster will adhere firmly to the surface of the lath. The Kansas City Metal Roofing & Corrugating Company report



The Kansas City Metal Lath.

a good demand for this lath, and state that the architects and builders who have used it speak very highly of its merits.

FLASHINGS.

THE CINCINNATI STAMPING COMPANY, Cincinnati, Ohio, issue a special circular relating to the Reagan metallic shingles which they manufacture. It is a pamphlet of convenient size, shows separate views of the different patterns of the shingles, including the Alexis and Gothic; also general views of roofs with the shingles applied. Other illustrations show valleys, gutters and ridging. Full descriptions accompany the cuts and a price-list is given of the goods. Three pages at the close are devoted to signed and dated testimonial letters which speak in high terms of the Reagan shingle.

THE NEW EDITION of the illustrated catalogue of Vaile & Young, Baltimore, Md., is an exceptionally neat and pleasing publication. It is a small volume bound simply in blue card covers, carrying the name of the firm and reference to their patent metallic skylights without putty and a cross section of skylight bar as a front page. A dozen pages are devoted to a careful and accurate description of their well-known skylight, the description being made plain by the aid of illustrations. Smaller cuts are also shown of hipped and turret skylights, &c. The remainder of the pamphlet contains half-tone engravings showing a large number of buildings where these skylights are in use. One of the folder pages shows a general view of the Marine Department of the Maryland Steel Company, on whose buildings Messrs. Vaile & Young have erected over 60,000 square feet of skylights. A handsome picture is presented of the new Library Building of Congress calling for 14,000 feet of skylight construction in copper. Other prominent buildings are included in the illustrations.

THE KANSAS CITY METAL ROOFING & CORRUGATING COMPANY, Kansas City, Mo., have just completed the decoration of their president's office in the Builders and Traders' Exchange. The decoration consists of an artistic and elaborately designed ceiling and side walls of stamped steel, made by the Wheeling Corrugating Company, for whom the Kansas City Metal Roofing & Corrugating Company are general Western agents. On May 22 an informal reception was held, to which the architects and builders of Kansas City were invited and expressed themselves in complimentary terms regarding the interior decoration above referred to.

THE FOSTORIA STEEL ROOFING COMPANY of Fostoria, Ohio, have just issued their sixth catalogue. This is a handsome publication of 68 pages, bound in stiff paper covers, with an embossed gilt title. The contents begin with an illustration of tubular seam steel roofing, together with a full description of the manner in which it is laid. Then follows pressed standing seam roofing, for laying which full directions are also given. After this comes V crimp roofing. This is succeded by sheet metal weather boarding, beaded siding and ceiling, pressed corrugated iron and steel, corrugated iron elevator siding, climney flashings, sheet steel pressed brick, rock face brick siding, sheet steel imitation stone panel, window and door casings, corner boards, corner caps, ridge rolls, &c. A valuable feature in connection with sheet metal specialties is the practical nature of the directions for applying them. Rules of measurement are given, as well as tables showing approximate weights of different kinds of roofing and siding. A separate department of the catalogue is devoted to eave troughs, miters, box gutters, corrugated conductor pipes, corrugated elbows, plain lock seam pipe, spiral pipe, hangers, finials, &c.

THE MONTROSS METAL SHINGLE COMPANY of Camden, N. J., have just issued a 20-page catalogue of their goods. In an announcement on the opening page the company state that they are alive to the fact that every order they fill is an advertisement either for or against them, and that as the manufacture of their line of goods constitutes their sole business, they cannot afford either to use inferior material or to slight the workmanship. The Gothic tile, Diamond tile, metal slate or shingle, Eastlake, Octagon shingle and special valley, made by this company, are all described and illustrated, and there are also illustrations of buildings covered with the tiles and shingles.

THE KANNEBERG ROOFING COMPANY, Canton, Ohio, have recently placed in their factory three new machines of their own invention for manufacturing corrugated galvanized conductor pipe. They claim this greatly improved machinery enables them to make the pipe in 10-foot lengths, with the corrugations deep, round and of uniform size.

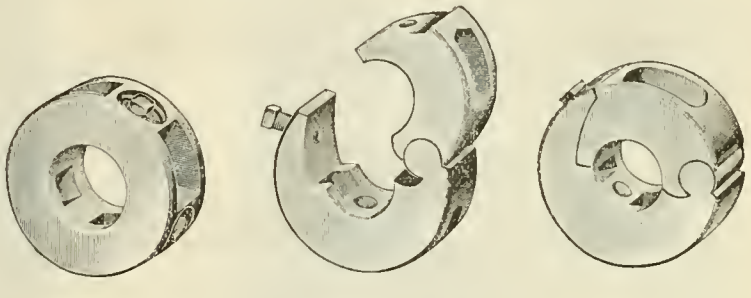
GOOD & WATERMAN, Laclede Building, St. Louis, have been appointed agents for St. Louis and vicinity for the sale of Walter's shingle, made by the National Sheet Metal Roofing Company, Jersey City, N. J. They report an excellent demand for these shingles and are now sending sample shingles and catalogues to the trade.

KNORR & BLOCKS, 165 Wells street, Chicago, are to supply the galvanized iron bays and cornices for the store and hall building of J. Geitner, Arlington Heights.

Newport News, Va., the youngest exporting port of the United States, is rapidly advancing to the front rank in importance. Its exports and imports during the past times of dullness and depression are said to have held up phenomenally, thanks to the institution of the Chesapeake & Ohio direct steamship line to Europe, which makes the port its headquarters. The Chesapeake & Ohio Railroad Company have millions of dollars invested in the place, and it is stated that President Ingalls of that road is about to sail for Europe to engage more steamships for the line.

The Giant Safety Collars.

These collars, which are shown in both the solid and split forms in the accompanying engravings, are chambered so as to avoid unnecessary weight upon the shaft, but this is done in such a way as to preserve full bearing surfaces at each end. The split collars have a hinge joint and may be put upon the shaft in a space equal to their length. When in place, the set screw that holds the collar together also secures it in position on the shaft. No bolts are used, and the set screw heads do not project above the surface. These collars, which are made by the Gouverneur Machine Company of Gouverneur, N. Y., have all the strength required, and all useless weight is avoided.



Solid. *Split, Open.* *Split, Closed.*

THE GIANT SAFETY COLLARS

SCRAP.

J. IRVING ROOERS, 53 Newcombe street, Liverpool, is sole agent for the United States and representative for the home trade for Cook Jenkins' tin house bran. He issues a circular price-list, giving the cost per net ton of the different qualities of meal and bran.

MARSHALL BROS. & Co. of Philadelphia have been compelled to shut down their rolling mills and tin plate works for want of fuel.

N. & G. TAYLOR COMPANY issue notice that for the benefit of the trade in Syracuse, N. Y., and vicinity, they will carry a full line of their guaranteed and special brands of roofing tin at 339 West Fayette street, Syracuse, N. Y. They request that all orders be addressed to N. & G. Taylor Company, Syracuse, N. Y.

The coal supply on the Duluth docks, Duluth, Minn., is reported as shrinking rapidly. Should the present rate of shipment continue the supply cannot last for more than two or three weeks longer.

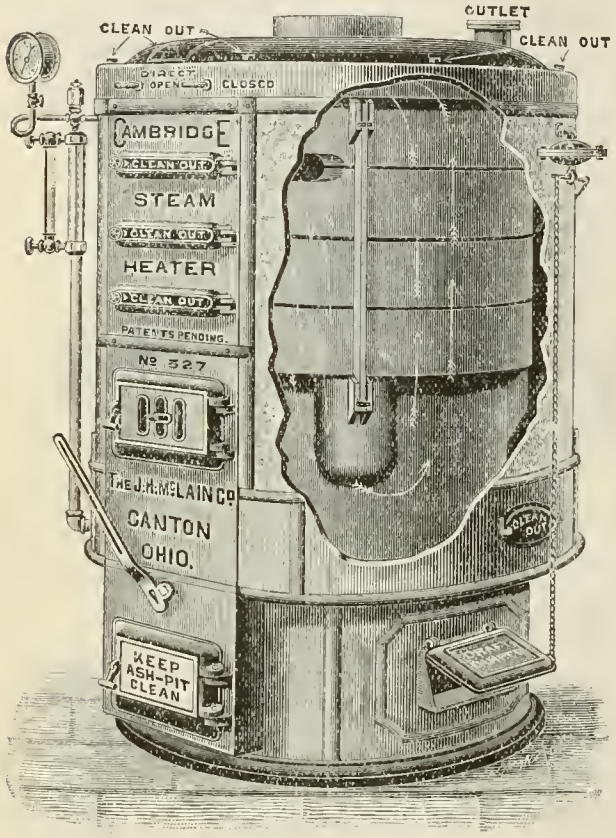
The Panama Railroad Company, since their disagreement with the Pacific Mail Steamship Company, have made arrangements for operating their own steamer service to Colon. For this purpose three vessels of the defunct Brazil Steamship Company, and now owned by the Standard Oil Company, have been chartered and are being fitted out in the Erie Basin.

STEAM AND HOT WATER.

The Cambridge Steam Heater.

The J. H. McLain Company of Canton, Ohio, have just brought out a new steam heater, christened Cambridge, which is herewith illustrated in Fig. 1.

The heater is built up of sections, Fig. 3, on the top of which is placed a smoke dome with an extension to receive the jacket. The sections are divided into tubes running from the front to the rear of the heater, these tubes being shaped and placed as shown in the sectional cut, Fig. 2. By this arrangement the manufacturers claim that the flames envelop each and every tube impinging against the bottom of the steam dome, thus preventing any deposit on the heating surface. The section next to the steam dome is used as a superheating chamber, and it is claimed that the steam entering the pipes will show a much higher temperature than is indicated by the pressure gauge. By closing the draft dampers the heated gases are directed down between the front of the heater, and then passing around the channel irons sweep over the entire surface of the heater before reaching the outlet in smoke dome. The Chicago agents for this company are the Illinois Heating Company, 88 Lake street.



The Cambridge Steam Heater.—Fig. 1.—General View with Casing Broken Away.

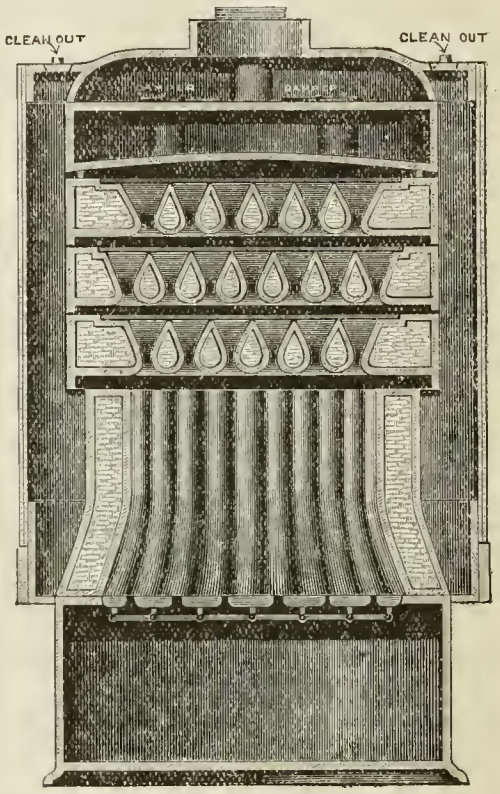


Fig. 2.—Sectional View of Heater.

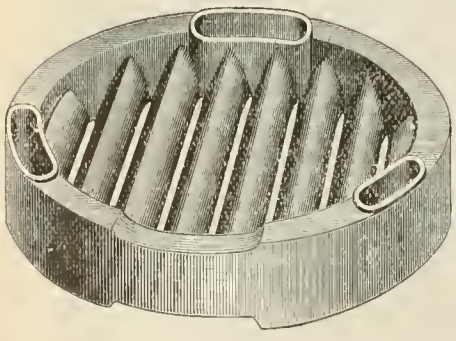

Fig. 3.—General View of Section.

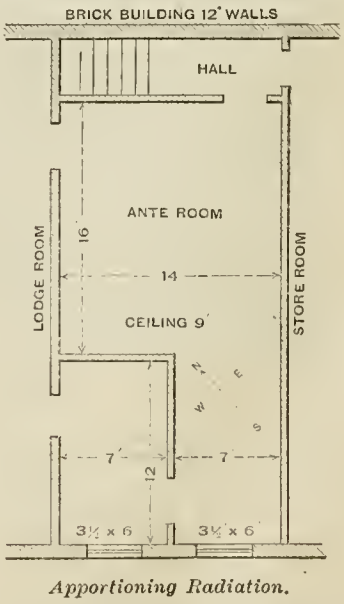
THE HERENDEEN MFG. COMPANY, Geneva, N. Y., send out postal cards printed in red and green ink directing attention to their book on home warming and ventilation, which they distribute on application. Incidentally the postal refers to the merits of the Furman boilers.

A NEW COMPANY have been formed under the name of the Royal Steam Heater Company, Gardner, Mass., and have purchased from the Central Oilgas Stove Company the patterns, &c., of the Royal Heater, which they will manufacture and sell. They will also erect steam and hot water heating apparatus. A new factory is being built, to be occupied by the company by July 1. The officers are J. R. Davis, president; C. O. Burt, vice-president; E. O. Drake, treasurer.

Apportioning Radiation.

From L. A. H., *New York.*—I inclose a sketch of two rooms on the third story of a brick building located in Westchester County, N. Y., which are used as anterooms to a lodge room. They have about the same amount of exposed wall and glass surface, although in their cubical contents there is considerable difference. I wish some of



Apportioning Radiation.

the readers of *The Metal Worker* would enlighten me as to the proper amount of radiation to heat these rooms by steam to a temperature of 70°. I would like to have the rule for figuring the radiation, and what difference should be made if the room faced north instead of south.

HEATING NOTES.

J. H. WALLACE, Pine Bush, N. Y., installed a Royal steam heater in the Reformed Church at Montgomery, N. Y., which a recent issue of the church paper praises highly.

THE WALWORTH MFG. COMPANY of Boston, Mass., have engaged a suit of rooms at the Broadway Central Hotel for use in displaying their various pipe fitting tools and steam and hot water heating goods and appliances during the steam fitters' convention in June. Their New York office is at 56 Beekman street, where a variety of their goods are shown.

SMITH & ABBOT COMPANY have been organized at Portland, Maine, for the purpose of making and selling steam and other heating apparatus and lighting and electric fittings.

THE J. H. MCLAIN COMPANY, Canton, Ohio, will have a full line of their Canton heaters on exhibition at the coming convention of the Master Steam and Hot Water Fitters' Association of the United States, which is to be held on June 19, 20 and 21 at the Broadway Central Hotel, New York City. The company will be well represented and hope to meet all their friends on the occasion. Their New York office at 69 Centre street is now fully equipped with sample heaters in charge of D. R. McCallum, who will attend to the wants of the trade in the heating line.

THE RICHMOND STOVE COMPANY, Norwich, Conn., distribute to their agents special illustrated catalogues relating to the Richmond heaters for steam and hot water. One circular, larger than the usual size, is issued to the Pond & Hasey Company, Minneapolis, Minn. In addition to the usual descriptions and illustrations of their goods, at the end are a number of halftone engravings showing residences in Minneapolis heated by their apparatus. A second circular carries the name of G. W. Dodson, Lawrence, Mass.

C. M. CONVERSE has opened an office at 96 Lake street, Chicago, representing the Elwood Iron Works, manufacturers of radiators, at Elwood, Ind.

THE STOCKHOLDERS of the Sperl Heating Company held a meeting last week and elected the following Board of Directors: E. E. Hendrick, A. P. Trautwein, C. E. Rettew, Edward Clarkson, E. W. Jackson, A. D. Harding and Thomas McDonald.

THE J. H. MCLAIN COMPANY, Canton, Ohio, have just opened an office at 1528 Champa street, Denver, Col., with G. B. Laramie, recently assistant manager of the American Boiler Company, Denver, in charge. They will carry a full line of Canton heaters for hot water, steam and warm air.

THE SMITH & ANTHONY COMPANY, Boston, Mass., through their New York house at 56 Beekman street, have engaged space at the Broadway Central Hotel for the exhibition of their hot water and steam heating goods during the convention of the master steam fitters. They will also have a room where they will receive and entertain their guests. The showrooms on Beekman street have been specially arranged with a view to presenting many attractions to the visitors to the convention, the Sanitas specialties occupying the position of honor.

AT A RECENT MEETING of the stockholders of the Gurney Hot Water Heater Company of Boston, Mass., it was unanimously voted that the name of the company be changed to the Gurney Heater Mfg. Company instead of as heretofore the Gurney Hot Water Heater Company. The company therefore will on and after June 1 be known under the title of the Gurney Heater Mfg. Company. The officers of the company are Edward Gurney, president; John A. Fish, vice-president; John M. Paisley, treasurer, and William T. Isaac, secretary. The company state that as they have added to their list of manufactures steam boilers and steam radiation, and inasmuch as the former designation of the company had limited their apparent operations to water heating apparatus, they decided to change their name slightly as above in order to specify without radical alteration more fully and broadly the field of their future operations.

WE ARE IN RECEIPT of an interesting batch of advertising matter from the Herendeen Mfg. Company, Geneva, N. Y. One of the pamphlets, entitled "Home Warming and Ventilation," is the third edition of this little work that the firm have published. The volume comprises extracts and articles by many well known authorities. Another pamphlet is the special florists' edition of the catalogue and shows the Furman heater in various styles and likewise presents illustrations showing the heater adapted to greenhouse work. Another pamphlet, very prettily gotten up, is entitled "The Faultless Furman Hot Water and Steam Boilers," being the regular catalogue with illustrations, description, price lists and references. Accompanying the pamphlet is a circular relating particularly to the Furman Junior hot water boiler, which is a small heater with a grate 12 to 14 inches in diameter and standing from 35 to 48 inches high. It is adapted particularly for conservatories, small dwellings, bathtub heaters, laundries, barber shops, &c.

The American House Beautiful.

In referring to the homes of American business men and contrasting them with the stately and the cottage homes of his own land, a writer in a late issue of *All the Year Round* presents the following views, which may prove interesting to many of our readers:

We Englishmen are proud, and justly so, of the stately and the cottage homes of our land. There is nothing like them elsewhere in the world, for they possess peculiar features of their own—the former in their antiquity and their associations, the latter in their own beauty and that of their surroundings. But the great mass of us live neither in stately homes nor in cottages, and of our residences—externally, at any rate—we have very small reason to be proud. Now, as the Americans have no stately homes of our English type, with the exception of the fine old colonial residences of Virginia and New England—and as their cottage homes are modern, practical and consequently ugly, and, as we have said, there is a wealth of refinement in many American minds, they have succeeded in making the villa residences of their big city suburbs the most beautiful in the world. I call them "villa residences," despite the fact that many of them are mansions in size and feature, because they are the homes of business men. The town residences of American business men are beautiful internally, but being in streets and rows they necessarily lack the external features which induce us to select the suburban home as a type of the American House Beautiful.

ORIGINALITY IN DESIGN.

In a survey of these the first fact which strikes the eye of the stranger is the extraordinary fertility of the American architectural brain in original design. A family likeness pervades all London suburban houses, be they north or south of the Thames. If there be one pretty house, there will be scores exactly like it all around: but until within the past very few years the London suburban builder reared as fast, as cheaply, and, in consequence, as inartistically as he could, with the result that the very great majority of London suburban houses are absolutely hideous. But in an American suburb, let us say for example, Brookline, near Boston, a suburb extending over miles of hill and dale, and planted thickly with houses, it may be asserted that not half a dozen buildings are exactly alike. The straining after the original and the striking has, of course, resulted in the erection of a few monstrosities, and of some houses more eccentric than pleasing in design, but the general average is exceedingly high. In this general originality of house design I seem to see a far greater instance of the much vaunted American liberty and independence than in any of the political and social institutions of the country.

INTERIORS.

After we have surveyed the exteriors of the houses and proceed to their interiors another new fact strikes us, and this is how very much better the different classes of American business men are housed than are their corresponding grades in our own country. Shop walkers, counter men and good artisans go home every evening to houses which in England would not be deemed unworthy of city men of good position. The taste in furnishing and decoration may not always be as good as the houses themselves, but there is nothing corresponding to what may be called our London "genteel villa residence," and the bank clerk, instead of huddling in one yellow brick box in a long row with a big name shuts himself up for the evening in his own little detached castle, which contains on a small scale all the accommodation and many more of the conveniences of an English gentleman's house. As we rise higher in the scale we reach the American House Beautiful, as distinguished from the American House Magnificent.

The recent rainfall was the heaviest ever recorded in Pennsylvania during the month of May. In five days of last week more rain fell in Philadelphia than during the whole month of any previous year since 1852. The damage caused by floods in the Susquehanna and Schuylkill valleys reached several millions of dollars. Happily the loss of life was comparatively small.

The war on immigrant rates from the Eastern seaboard to points west of Chicago and St. Louis is at last ended by agreement between the Western railroads.

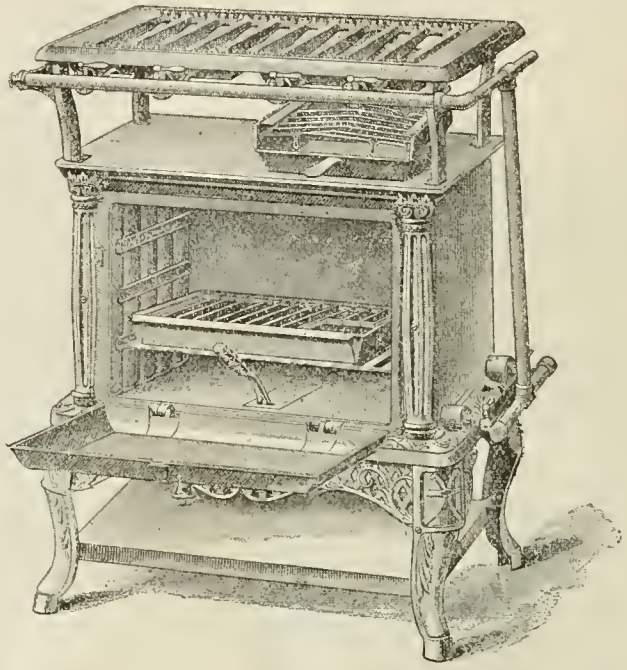
A Novel Stove Ornament.

The illustration shows a piece of the handiwork of John J. Fones, a native of Pawtucket, R. I., and now foreman of the sheet iron shop of the Richardson & Morgan Company, 92 Beekman street, New York. Mr. Fones, who is over 60 years of age, speaks of the first 19 years of his practice as sheet iron butchery of the "trim and fit" character. He says *The Metal Worker* first inspired him to work on a different line, and as a result he left his native town in order to receive the night instructions given to mechanics in New Haven by the professors of Yale College. He applied himself to the study of geometry and acquired the art of pattern cutting to the absolute disuse of all "trim and fit" methods. The ornament shown in the illustration is supported by a brass tube attached to the top of a stove, and consists of a hub with arms connecting with circular hollow tubes forming the frame of the revolving ornament. Holes drilled in these tubes support wire shafts which fit into glass bearings in air wheels resting upon them. The upper portion is made to revolve by the pressure of the air heated by the stove rising against a cardboard spiral fastened to and suspended from the hub by wires. There are 45 air wheels of various sizes, but all of different shape, some revolving in one direction and some in the reverse direction. Some of the wheels are in one piece, others have as many as 24 pieces, and the patterns for all were developed by the same rules that daily apply in pattern cutting. The wheels are covered with colored enameled papers, tinsel rosettes and artificial flowers, which give it a very gay appearance, and when in motion it is quite a fascinating sight. This ornament is only one of several that have been made for different parties, no two of which have been exactly alike.

A Novel Stove Ornament.

The Wolff Gas Cookers.

The illustrations presented herewith show the Wolff gas cookers manufactured by the Wolff Gas Radiator Mfg. Company, 164 Franklin street, New York. Fig. 1 shows the Wolff gas range, which is possessed of many attractive features. In appearance it is substantial without being cumbersome. The top is rather novel in construction, consisting of an outer frame with a series of removable bars resting just above the burners on which boilers or kettles may be placed. The burners located just below these bars are covered with an irregularly perforated cast iron plate having projecting pins on the lower side through which the flame plays. In operation this plate and the pins become red hot, throwing a strong radiant heat against the vessels for cooking food in addition to the heat of the gases which play around them. As is shown in the picture, these burners are raised slightly above the top of the oven, so that steaks or articles to be broiled can be placed on top of the oven under the burner. The construction and arrangement of the oven is such as to get the full effect of the gas consumed. The burner is made in two parts at the front and back of the oven and may be lighted by lifting out the plate in the bottom of the oven, which is shown with a litter in it. The flames of the two parts extend all across the oven, thoroughly heating it, and the products of combustion pass up the sides of the oven through circular tubes which heat the oven on the sides. These tubes being within the casing of the oven proper, the outer sides of the oven are but little heated and but a small heat is thrown off into the apartment in which the stove is used. These tubes enter a chamber at the top of the oven by means of a flue, the heat being distributed over the top of the oven and then passing down to an outlet at the bottom of the oven at the back. This range is made in two sizes. Fig. 2 shows the Wolff gas cooker, the burners on the top of which are the same in construction as those on the gas range, and the broiler beneath them has the advantage of a door so that roasting as well as broiling can be done. By means of a portable oven resting on top of the cooker baking can be done. The cookers are also made in two sizes.



Wolff Gas Cookers.—Fig. 1.—Gas Range.

The feature of both the ranges and cookers is their ample capacity in the oven and broiler space.

The official returns of the foreign commerce of New York for the month of April show a considerable decrease as compared with the corresponding month of last year. The total figures are: April 1894, $81,095,074; April 1893, $101,003,716; a falling off of $19,908,642. This decrease is mainly due to the loss of imports, which amounted to $17,273,203, while the movement of specie shows a decrease of nearly $3,500,000. In merchandise, exclusive of specie, the exports show a gain over last year of nearly $2,000,000. For the first four months of the calendar year the imports of merchandise reached $148,511,981, against $230,948,996 last year, and exports $116,724,460, against $100,939,451.

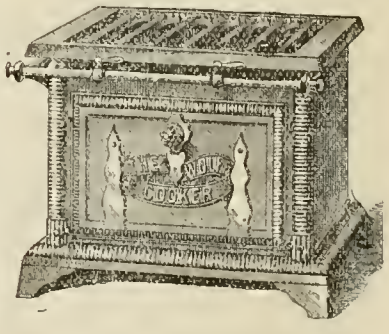


Fig. 2.—Wolff Gas Cooker.

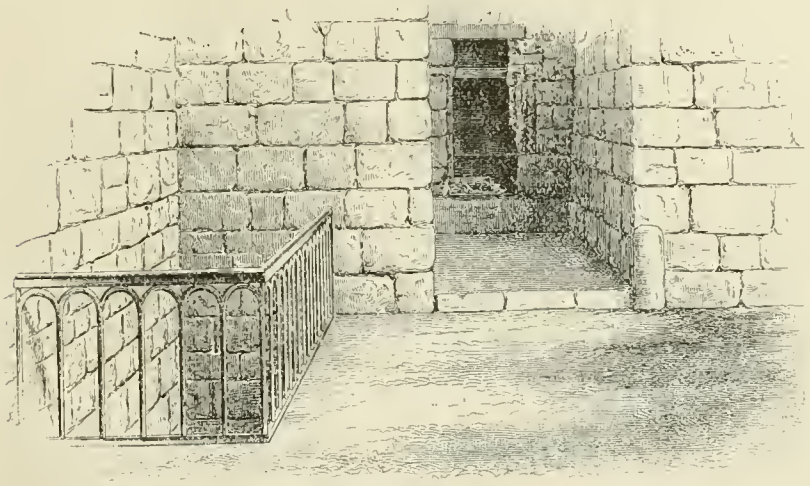
STOVE TRADE NOTES.

A Very Old Furnace.

We have within recent years printed several descriptions of old stoves, most of them of early American manufacture. Some of them have dated back but 20 years or so, others had their origin before the Declaration of Independence, and there were one or two, if we remember rightly, that were made on the other side of the ocean a century or two ago. The illustrations have shown various degrees of crudity in design and decoration, but all have been interesting as types of manufacture at different periods, showing how the art of stove founding has progressed toward both greater utility and a higher standard of decoration.

Now we will go backward still further in the history of house warming and give an example of a much earlier type of heating apparatus than any of those we have heretofore presented; the heater in mind is in fact the progenitor of the hot air furnace and belongs to the class of apparatus that the ancient Romans used in connection with their famous public and private baths. The accompanying engraving, which was made from a photograph, shows very imperfectly a Roman bath and hypocaust as they may be seen today in the city of Chester, in England. The apparatus, if we may so term it, is beneath a little stationery shop and was unearthed some 75 years ago, but though the masonry was built very many centuries ago the workmanship was so admirable that it appears to be hardly more than 100 years old. The city of Chester was an old fortified camp of the Romans and the bathing establishment we illustrate was built during the first century. The fire pot of the heating apparatus, or hypocaust, is a low stone room, entered through the doorway shown at the back of the picture. Here the fire of wood was built and the heat transmitted through the ceiling to the room above. The bath, of stone, shaped much like a modern bathtub, though longer and very much deeper, is now surrounded by an iron railing, as shown at the left of the engraving. It is in excellent preservation and is water tight to this day. The following particulars of the apartment are from Hemingway's History of Chester: The bath is 10 feet long, 7 feet deep and 4 feet wide (date A.D 95). The hypocaust is 18 feet long, 8 feet wide, over which is the sudatorium (or sweating room), of the same dimensions. The roof of the hypocaust is of Roman tiles, 3 inches thick and 19 inches square, perforated with small holes 6 inches apart. Immediately over these tiles is a bed of finely powdered lime 9 inches thick, for the purpose of conveying the heat (and preventing the smoke) to the sudatorium above, around which are seats, on which the bathers sat until the heat from the hypocaust threw them into a free perspiration, after which they were scraped with a bronze instrument called a strigil (by which means all impurities were removed from the skin). They were then shampooed, rubbed down with towels (linteа), perfumed and anointed with oil, after which they retired to the anteroom (tepidarium), where they waited until quite cool before returning into the open air.



A Very Old Furnace.

ODD PLATES.

Many of the storage warehouse companies in the city, says a writer in a Boston, Mass., paper, have this season inaugurated a new plan in regard to taking stoves for storage during the summer, and are refusing to store them unless the fee is paid in advance or they are stored with other articles. The reason for the step is that many of the companies have had valueless stoves left on their hands by the owners, who replaced them with new ones in the fall. The stove then had to be kept for a long while, and if the owner refused to take it away it was sold for old metal at a low price, so that the total loss to the company was considerable. A few companies in the city take stoves of all kinds on storage as formerly, but even those doing so complain that the business is attended by a loss.

At a meeting of the stockholders of the Mobile Stove & Novelty Works, held on the evening of Thursday, May 17, Adam Glass, A. H. Spira, T. S. Fry, E. E. Posey, William Edgar, William Stou'z and J Thompson were elected directors.

We learn from the J. H. McLain Company, Canton, Ohio, that they have about ready for the market their new warm air furnace, called the Oxford Perfect Blast. They have already issued advance sheets of their warm air catalogue, which are ready for the trade.

A recent issue of the *Herald*, published at Quincy, Ill., is authority for the statement that Henry D. Castle has disposed of his interest in the Comstock-Castle Stove Company of that place, and will engage in business in New York City.

John Keyser, the veteran stove manufacturer, of 115 Beekman street, New York, closes his business career upon July 1 next. Mr. Keyser is hale and hearty at the age of 76 years, 55 years of which have been passed in intense business life as a manufacturer of stoves and furnaces and an inventor. Mr. Keyser was born in Westport, Conn., and began business in 1837 as a polisher of stoves at 247 Water street, New York. In two years' time he was in the position of an employer, and has remained so ever since. Altogether he has taken out 32 patents for stoves and furnaces. He has had a checkered business career, having at one time been the head of a very large enterprise, but like the majority of other men in active industrial life he has been overtaken at times by disaster. The work of his life that Mr. Keyser dwells on with pardonable gratification are the charities and reforms of one sort or another with which he has long been associated. Mr. Keyser will make his home at Hartford, Conn.

Hansell & Belson have issued a notice to the trade to the effect that they have located at 144 North Second street, Philadelphia, Pa., for the sales agency of Charles N. Noble & Co.'s full line of stoves, heaters and ranges. The firm also carry in stock a full line of steel ranges, gasoline, oil and gas stoves, refrigerators, ice chests and numerous side lines adapted to the wants of the trade.

William Resor & Co. of Cincinnati, Ohio, are making their Monitor parlor wood base heater in three sizes, adapted to take in wood 21, 23 and 25 inches in length. Strong claims are made for this heater, and those who have used it testify in flattering terms to the satisfaction which it has given.

A little boom in gasoline and oil stoves is reported from some sections of the West. The coal miners' strike has completely cut off the supply of coal in various districts, and the farmers are without fuel. They are thus forced to seek a substitute or go with uncooked food. Gasoline or oil cooking stoves fill the gap admirably at this season of the year, and very probably farmers'

wives will bless the day when they were driven to this pleasant method of cooking in warm weather.

THE SHOW WINDOW of Landon & Ketchum, at 23 West 125th street, New York, is made attractive by a display of gas ranges, hot plates, ovens and the Challenge water heater.

J. Q. A. BUTLER & SON are a new firm at 284 Pearl street, New York. Mr. Butler is well known to the stove trade of the city, and the new firm will make a specialty of supplying the trade with any make of stoves, ranges or furnaces that is required. The Beaver stoves and ranges stand first in the lines they will handle, and they will use the show room of the Danville Stove Company for a salesroom. They are New York agents for the coal and gas steel ranges made by the Mason & Davis Company. They will make a specialty of their combination range for both coal and gas.

THE EXCELSIOR MFG. COMPANY of St. Louis, Mo., have issued an illustrated circular bearing date of May 15, and calling attention to illustrations of three new heating stoves which they have added to their line. These are known respectively as the Rival, Hot Blast and Nestor. The first and last named are square stoves, and are claimed to possess greatly increased heating capacity as compared with round stoves of the same diameter. The Rival and Nestor are symmetrical in shape and first class in construction. Special care has been taken to insure efficient combustion, each stove having a circular draft regulator on top, by the proper adjustment of which, it is claimed, the fire can be kept 24 hours with soft coal. The addition of a magazine or feed cylinder allows these constructions to be used as self feeding hard coal stoves. The Hot Blast is of handsome appearance and constructed in a manner to give satisfaction in operation. An ornamental fretwork surrounds the inside structure, the space between the body of the stove and the casing serving to heat the air which finds its way in at the bottom and sides, thus making it practically a "room furnace." The company are also distributing as an advertising novelty a balanced butterfly made of cardboard, one side being printed to represent that insect. The tips of the wings are so weighted that placing the head of the butterfly on the tip of the finger it will readily balance horizontally, and blowing on it gently it will wave and indolently flutter like its living prototype. The unornamented side of the butterfly carries printed matter relating to the Charter Oak stoves and ranges.

THE FAMOUS STOVE COMPANY of Indianapolis, Ind., have issued an exceedingly attractive catalogue and price-list of the Magnet stoves and ranges, which they manufacture in great variety. The 54 pages of which the volume consists are profusely illustrated and carry brief descriptive particulars relative to the goods shown. The Model Magnet range for 1894 occupies the leading place and is offered as a novelty for this season. It is made with six boiler holes, fire box either right or left hand, and is adapted for using hard or soft coal or wood. Under the name Magnet the company offer a new line of four-hole cook stoves of neat ornamentation and embodying the latest improvements. Other goods of interest include the Imperial six hole range, made with two sizes of oven; the Tecumseh, another member of this class; the Best Friend, the Indiana, Black Cryatal, Tecumseh and Favorite cook stove; Brilliant soft coal base heater, made plain and full nickeled; the Brilliant surface burner, made direct draft and revertible flue; the Magnet Oak for 1894; the Magnet Todd, for burning wood; the Penn Franklin, for soft or hard coal or gas; the Tecumseh and the Champion Box.

A RECENT ISSUE of one of the local papers contains the following squib relative to a well-known representative of the Portsmouth Stove & Range Company of Portsmouth, Ohio: "Will Stork, with his limbs draped in lavender pants and his feet decorated with shoes which had gained their ideas in color from a New England pumpkin pie, together with other toggery suitable for a tour of the sunny South, left on the morning N. & W. train for Norfolk, Va., where he expects to take sea baths for a week or so to work the old puns out of his system. He also expects to sell stoves and other articles for the generation of artificial heat to the natives. 'Pete' expects to come back completely restored in health, but he will doubtless leave the South all 'stove up.'"

THE UNITED VAPOR & GAS STOVE COMPANY have applied for a charter of incorporation under the laws of Illinois. The location of the company is stated to be in Chicago and the capital stock is placed at $8,500.000. The incorporators are Walstein F. Douthirt, Frank O. Soderstrom and Morris P. Carroll. This is one of the periodical attempts to consolidate the several vapor stove manufactories. We mention the matter merely as an item of current news, which may ultimately develop into something important or else fade gently into oblivion. Thus far but little can be ascertained of the project, and probably nothing will be known until the plans of the projectors are consummated —which will be some time hence. Meanwhile the vapor stove trade will continue to amble forward at its usual pace and every manufacturer will pay more attention to getting orders and filling them than in devising schemes whereby he and his *confrères* may unite their forces into one huge aggregation.

FRIDAY, MAY 25, was a gala day with the Chicago house of the Detroit Stove Works. To properly celebrate the completion and occupation of their new warehouse, the company issued invitations to their numerous friends and patrons to a reception on that day. The invitations were elegantly engraved, as befitted such an occasion. The warehouse, at Twenty-ninth and La Salle streets, was thrown open to visitors from 9 a.m. to 10 p.m. Manager W. M. Shaddinger and Treasurer G. B. Gunderson, supported by a corps of courteous and untiring assistants from their force of clerks and salesmen, exerted themselves to their utmost to entertain the stream of visitors which continued to pour in until late in the evening. A luncheon was served in one of the apartments of the office, but it was not the chief attraction to the callers, who inspected every part of the warehouse and were unsparing in their praises of its admirable arrangement and location. The popularity of Manager Shaddinger was attested by the continuous reception held in his room, every one passing in to pay his respects. The manager's room was bright with flowers. Among the visitors the city stove trade was, of course, most largely represented, but there was also an excellent attendance from outside points. Inquiry was frequently made for President E. S. Barbour, and it was with regret that callers learned of his enforced absence on account of ill health.

THE MICHIGAN STOVE COMPANY have just issued a superbly printed circular entitled "The World's Greatest and Most Profitable Specialty in Oak Stoves." The subject matter treats of Syphon Oak Garlands. These are base heating stoves of the oak type. In them the flue entirely encircles the base, the ashes falling through an opening in the center into a large ash pan. The base flue is brought as near the floor as possible without burning it Access is given to the whole flue space for cleaning. The grate is a novel construction, designed to prevent the formation of clinkers while giving a good exit for refuse. The feed door is on the side, and has a tilting device by which the direct damper is opened whenever the feed door is opened, thus preventing the emission of smoke into the room. An independent hot air circulating flue is provided, through which air enters the bottom of the stove and flows out into the room after being heated. A cut is given showing the bottom of the stove removed, exposing the base flues. Another illustration presents a full view of the stove adorned with richly carved moldings in the top, door piece and base, with nickel foot rail and other trimmings and an artistic urn as a top piece. Comparative prices are given to show that a full base heating stove can be had at a very slight advance in cost over direct draft stoves of equal heating capacity in the company's Garland line.

CHAS. NOHLE & CO. of Philadelphia, Pa., will have several new styles of goods on the market this season, among them being a steel range. They are this week making a shipment comprising 200 heating stoves of assorted styles to Switzerland. The firm have some good foreign trade and make frequent shipments.

THE PENINSULAR STOVE COMPANY of Detroit, Mich., are presenting their agents with neat memorandum books of a size convenient to carry in the vest pocket. In addition to the regular ruled pages for memoranda there is given more or less information of a general character, among which may be mentioned, explanation of storm signals, rates of postage, both foreign and domestic, population of the larger cities in the United States, abbreviated parliamentary rules and usages, what to do in case of accidents and antidotes for poisons. There are also blank spaces to be filled in with the name and address of the owner of the book. together with other particulars, for the purpose of personal identification. Not the least valuable feature is found on the second and third pages of the covers, which carry calendars for 1894 and 1895. The company are also distributing to their friends an interesting assortment of handsomely illustrated cards, aggregating 43 in number. These, as may be supposed, are intended for advertising the company's goods and are calculated to serve this purpose in an admirable manner.

The commencement exercises of the Manual Training School at Camden, N. J., will be held in the Temple Theater June 10.

It has been decided not to hold the International Exhibition at Brussels until 1896.

TRADE REPORT.

The Iron Market.

The scarcity of Coal and Coke is having an increasing effect upon the production of Iron and Steel. Practically the manufacture of Pig Iron in the territory between the Alleghany Mountains and the Chicago district is suspended, and in their efforts to continue running the Steel mills have cleaned up the stock of Bessemer Pig.

The scarcity of soft Coal is beginning to tell on the mills east of the Alleghany Mountains, and together with the floods has caused considerable temporary suspension.

While thus the supply has been very materially curtailed the demand has improved very little. Buyers, except for small lots for immediate delivery, continue extremely indifferent.

Quite a little boom in prices has been worked up over the Italian demand for Old Rails which has been shrouded in so much mystery. Two vessels have been chartered, involving from 2000 to 4500 tons. Under the stimulus of inquiries holders have now worked up their ideas on prices to the point that any further business cannot be done, unless the Italian market goes up quite considerably.

Pig Iron.—The demand for Foundry Iron in the New York market is light, and in spite of the coal miners' troubles, prices remain unchanged. It is possible that some of the Eastern Pennsylvania furnaces will go from Foundry to Bessemer Pig. We quote standard brands $12.50 @ $13 for No. 1; $11.25 @ $12 for No. 2, at tidewater. Southern Iron, same delivery, $11.50 @ $12.25 for No. 1; $10.50 @ $11 for No. 2; $10 @ $10.25 for No. 3; $10.25 @ $10.75 for No. 2 Soft, and $10.50 @ $11 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is $9.75 @ $10.25.

Some holders of Pig Iron in the Philadelphia district claim to be getting better prices than have been quoted during the past two or three weeks, and look for still better prices in the near future. The market is referred to as badly mixed, however, and all sorts of quotations are given, especially for Foundry grades. A good deal depends on quality and a good deal on the desire to sell, and between the two a variation of 50¢ ℔ ton and upward is frequently met with. The usual quotation for No. 2 X is $11.50 @ $11.75, but sales at $11.25 are not infrequent. Buyers are very indifferent, however, and very few are disposed to contract far ahead even at the extremely low figures now ruling. Low grade Iron is wanted at $10 @ $10.25, delivered, but there is very little to be had at less than $10 50, some being held at a still higher figure. General quotations for Philadelphia or equivalent points are about as follows:

Standard No. 1 Foundry X	$12 50 @ $12.75
Standard No. 2 Foundry X	11.50 @ 11 75
No. 2 Plain	10.75 @ 11.00
No. 1 Soft	11.50 @ 11.75
No. 2 Soft	10.75 @ 11.00

Advices from Chicago indicate that local Coke Iron has been in excellent demand in that market. Prices are very firm, makers refusing to give concessions from current rates. Agents of Southern furnace companies report only a moderate business, yet they are receiving a great many inquiries, which are small but more plentiful of late. Some of the Southern companies are completely out of the market and others are out of some grades. The foundries in the Chicago district seem to be able to get enough Coke to keep in operation and less fear is experienced of a Coke famine than some two weeks ago. Quotations are given as follows for cash:

Lake Superior Charcoal	$15.00 @ $15.50
Local Coke Foundry, No. 1	11.25 @ 11.50
Local Coke Foundry, No. 2	10.50 @ 11.00
Local Coke Foundry, No. 3	10.00 @ 10 50
Local Scotch	11.50 @ 11.75
Ohio Strong Softeners No. 1	12.60 @ 13.50
Southern Silvery, No. 1	@
Southern Silvery, No. 2	@
Southern Coke, No. 2	10.00 @ 10.35
Southern Coke, No. 3	9.75 @ 10.00
Southern, No. 1, Soft	10.25 @ 10.50
Southern, No. 2, Soft	10.00 @ 10.25
Tennessee Charcoal, No. 1	@
Tennessee Charcoal, No. 2	@
Alabama Car Wheel	17.50 @ 18.00
Jackson County Silvery	15.00 @ 16.00

The stocks of Foundry Iron at Pittsburgh and in the Valleys are very light, and when the demand increases, as it must when the mills get in good running order again, it is not improbable that higher prices will prevail. Outside of a few unimportant transactions in Foundry there have been no sales for close delivery during the week in the Pittsburgh market. The following prices are asked for spot deliveries:

No. 1 Foundry	$11.10 @ $11.25,	cash
No. 2 Foundry	10.50 @ 10.75	"
No. 3 Foundry	9.75 @ 10.00	"

The general undertone of the Cincinnati market for Pig Iron has been strong all the week and especially has Soft Iron been wanted and sold at better prices. The sales were mainly in jobbing lots and of Foundry grades, No. 2 being most in demand, and No. 2 Soft coming full up to No. 2 regular because of its scarcity. The probable advancement of freight rates by the Northern railroads the middle of June has had a demoralizing effect on the market, but it would be difficult to buy much Iron to be shipped before that time. Quotations are unchanged, but are scarcely more than nominal, as follows:

Southern Coke, No. 1	$10.25 @ $10.50
Southern Coke, No. 2	9.25 @ 9.50
Southern Coke, No. 3	8.75 @ 9.00
Ohio Soft Stone Coal, No. 1	14.50 @ 15.50
Ohio Soft Stone Coal, No. 2	14.00 @ 14.50
Lake Superior Coke, No. 1	12.50 @ 13.00
Lake Superior Coke, No. 2	11.50 @ 12.00
Hanging Rock Charcoal, No. 1	17.00 @ 17.50
Hanging Rock Charcoal, No. 2	16.50 @ 17.00
Tennessee Charcoal, No. 1	13.00 @ 13.50
Tennessee Charcoal, No. 2	12.00 @ 12 50
Standard Southern Car Wheel	16.25 @ 17.00
Lake Superior Car Wheel and Malleable	16.25 @ 16.75

The cut in Western freight rates, which was withdrawn early in the week, has had a beneficial effect on the St. Louis Pig Iron market. A number of heavy sales have been made which were made possible by the reduced rate. Prices are firm, and a continuance of the Coal strike will cause additional strength. Shipments are being delayed by the inability of consumers to secure Coal and Coke, and without these they have no immediate use for Iron. We quote as follows for cash, f.o.b. cars St. Louis:

Southern Coke, No. 1 Foundry	$11.00 @ $11.25
Southern Coke, No. 2 Foundry	10.00 @ 10.25
Southern Coke, No. 3 Foundry	9.75 @ 10.00
Southern Car Wheel	17.00 @ 18.00
Lake Superior Car Wheel	16.25 @ 16.50

Metal Market.

Pig Tin.—The market appears to be somewhat firmer, although business has not increased and the demand from consumers and interior dealers has been very ordinary, while stock is accumulating in this market. Nevertheless official prices have been marked up a trifle and the jobbing rate for small lots of Straits Pig is maintained at about 21¢ ℔ lb.

Copper.—Business has been slow, and what there was of it passed at practically the same prices that have ruled for some time past. There is little change in the character of demand from home buyers. Prices are rather easy, 10½¢ ℔ lb being the outside asked for small lots of Lake Ingot from store. Casting stock on the same basis is generally quoted at about 9½¢.

Sheet Copper.—Nothing beyond a routine demand of moderate character is reported for Manufactured Copper. Consumers are taking only such limited quantities as they need for immediate use. Prices are, nevertheless, fairly maintained, although competition is as sharp as ever. Production has been considerably restricted of late, and manufacturers are looking to an improvement in prices as soon as general trade conditions are better. Stocks in dealers' and consumers' hands are unusually light.

Pig Lead —Sales have been moderate and the demand has not changed perceptibly, being influenced very little by the results of the tariff maneuvers. For small lots of American Pig, jobbers ask from 3⅞¢ to 4¢ ℔ lb. Western business is, however, understood to have increased, and a general improvement both in volume of trade and in prices is anticipated in that market.

Lead Pipe and Sheet —Dealers generally report a demand that is considerably below the average for the season. Some of the larger manufacturers, however, speak of a fairly satisfactory run of trade during the month of May, exceeding their anticipations in some respects. Probably the absolute dearth of speculative building has affected the jobbers, while the usual spring repairs and renewals, added to some substantial building operations of a legitimate character, have served to keep the larger houses busy of late. Prices are unchanged in this section.

Spelter. — There is a somewhat stronger tone to the market, not because of livelier buying in this section or vicinity, but on purchases made at primary points of stock for shipment elsewhere. As there is no surplus stock on the market an early improvement in price is more than likely. Ordinary

Western Spelter, in small lots from store, fetches about 4¼¢ ℔ lb.

Sheet Zinc.—The closing down of the Zinc works, owing to scarcity of fuel, has resulted in a sharp advance on Sheet Zinc during the week, with the likelihood of a further rise in price within a few days, as stocks are by no means excessive in any quarter. For 600 lb casks, 5¢ ℔ lb is the current quotation, smaller lots selling at 5½¢.

Antimony.—Only routine business has been done, but enough of it to keep the market quite steady. Quotations are unchanged.

Tin Plate.—Business has been somewhat uneven, but the aggregate makes a fair showing, and from all accounts compares favorably with that of the preceding week. Some good sized orders for moderate quantities of Cokes and Bright Charcoal Plates for the out of town trade sufficed, early in the week, to give a firmer tone to the market, as stocks of these Plates are by no means superabundant just now. Prices have, however, undergone little change, but it seems increasingly difficult to buy futures at prices that were commonly quoted a week ago. The prevailing and prospective scarcity of fuel, due to the Coke strike, has caused a rush of orders for domestic Plates. Home manufacturers are unable to make any forward contracts, in view of the more than probable closing down of the majority of Tin Plate works in the near future, owing to the shortage of domestic Black Plates, should the strike continue. As there has been a falling off in importations of Plates during the current year, amounting to at least 1,000,000 boxes, the stocks in hand at the present time are not at all excessive. The market on the other side is reported, too, as being firmer, and all indications point to the next movement of prices as being more likely to be upward than downward. Domestic Roofing Plates are in good demand. In the West, especially, there is a scarcity of this material, and jobbers report that they are unable to accumulate any stock, the Plates being shipped out as fast as received from the works.

A special London cable dispatch of May 30 to *The Iron Age* reports on the British Tin Plate market as follows: Transactions in Tin Plate have been smaller at the recent advance in prices, and there has been quite general tendency toward conservative policy in view of the supposed near approach of the settlement of the American tariff. On the part of sellers there is still a hardening of prices. Swansea quotations are as follows:

Bessemer Cokes, 14 x 20	9/10½	@ 10/1½
Siemens Cokes, 14 x 20	10/4½	@ 10/6
Ternes, double box	18/3	@ ..
Charcoals	11/	@ 13/

There has been quite a heavy inquiry for Black Plates for America. The stock of Tin Plate in England was at that date about 294,000 boxes.

Sheet Iron.—The coal strike, in causing the closing down of mills, has induced a strength in the Sheet Iron market that has not existed for a long time. Black iron, although not very notably active, is more so than has been the case of late, and prices are more firmly maintained. Some makers are quoting an advance, although others ask as low rates as ever. Galvanized Sheets show an improved tendency in price, with buyers urging prompt shipment on contracts. Discount on small lots from store is quoted at 75 % @ 75 and 5 %.

Chicago Report.

Scrap.—Dealers continue the following list of buying prices, Chicago delivery:

	Per net ton.	Per lb
No. 1 Wrought Scrap	$7.00	...
Machinery Cast	6.00	...
Malleable Cast	5.00	...
Stove Plate (free of burnt)	4.00	...
Burnt Iron and Grate Bars	3.00	...
Sheet Iron and Hoops	2.00	...
Plow Steel and Breaking Stock	4.00	...
No. 2, such as Shovels, Hoes, &c.	3.00	....
Old Boilers—whole (Iron)	3.00	....
" (Iron)—cut in single Sheets and Rings	5.00	....
Old Gas-Pipe and Boiler Tubes	5.00	....
Cast Borings	3.00	....
Turnings	4.00	....
Horseshoes	8.00	....
Copper Bottoms	....	5½¢
Copper Clips and Heavy	....	7 ¢
Heavy Brass	....	5½¢
Light Brass	....	3 ¢
Pipe Lead	....	2¼¢
Tea Lead	....	2 ¢
Zinc	....	2 ¢
Rubber	....	3½¢

Anthracite.—One of the most active weeks ever known in the Chicago Anthracite trade has just closed. Enormous shipments were made to Missouri river points to take advantage of low freight rates, which were restored on the 28th. In addition to this exceptional demand a considerable business was done with dealers in nearer territory who are now laying in stocks for next winter, taking advantage of prevailing low prices. Carload lots of 12 net tons or over are quoted as follows:

	Egg, Sto Grate.	and Ch
Chicago, Ill	$5.00	$5 25
Milwaukee, Wis	5.00	5.25
Kansas City, Mo	8.20	8.45
Council Bluffs, Iowa	8.20	8.45
Lincoln, Neb	8.35	8.60
Sioux City, Iowa	8.20	8.45
Aberdeen, S. Dak	8.25	8.50
Dubuque, Iowa	6.30	6.55
Madison, Wis	6.50	6.75
St. Paul, Minn	7.50	7.75
Burlington, Iowa	6.50	6 75
Des Moines, Iowa	7.95	8.20
Davenport, Iowa	6.30	6.55
St. Joseph, Mo	8.20	8.45
Leavenworth, Kan	8.20	8.45
Omaha, Neb	8.20	8.45

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$8.00
Pueblo	8.00
Colorado Springs	8.00
Leadville	8.00
Cheyenne, Wyo	10.00
All points between Denver and Missouri River	8.85

HOPKINS & Co., proprietors of the New York Wire Works, at 90 West Broadway, New York, have recently rearranged their warerooms and are making a fine display of Wire Guards, Trellises, Window and Office Screens, and are showing as seasonable goods a line of Lawn Chairs and Tree Guards.

A. L. BURTIS of Lockport, N. Y., whose name many of our readers will associate with short methods of pattern cutting and other ingenuities relating to sheet metal work, is, as some of the trade know, also interested in both music and poetry. By inference we assume that he is also interested in the bicycle, for a recent issue of a local paper gives a very charming song written by him under the title "Wheeling." The writer has caught the spirit of the motion of the bicycle and transferred it in a very delicate way to the rhythm of his verse.

CONDITION OF THE

Hardware Trade.

THERE has been little change in the general situation since our last review of the market. The volume of business is moderate, and is probably diminished by the fact that the end of the month is near. Advices from the retail trade indicate that business is in most sections below the average, but that on the whole the general conditions are fairly satisfactory. While there is less building than usual there is evidently an improvement in this direction, and manufacturers of Builders' Hardware refer to a somewhat increased demand. Seasonable goods are moving in nearly the usual quantities, but even in this branch of trade there is some complaint. In the matter of prices there is little new to report. The raw material is affected somewhat by the existing strikes, but their influence has not as yet been very marked on Hardware. Nails and Barb Wire, however, and some other heavy goods are somewhat stronger in price, and on some lines higher quotations are ruling. The future course of the market is canvassed by the trade with much interest, but as yet there are no indications of an important improvement either in demand or prices in the near future. It is, however, to be expected that a fair business will be done during the next month or two, and it is hoped that in the fall business will assume good proportions.

Advices from Chicago.—The Shelf Hardware trade was further stimulated the past week by the notice of an advance in freight rates to Western points to take effect on the 28th. The Western dealers, who had been expecting low freight rates to continue indefinitely, were then impelled to hurry in their orders for immediate shipment of all classes of goods which they would require for the next two or three months. The activity thus caused has greatly increased the volume of business, but it is expected somewhat at the expense of the immediate future. It will not be surprising if trade should now prove dull for some time until the goods thus shipped are distributed. Manufacturers' agents have recently enjoyed a very much better demand for Carriage Bolts, Machine Bolts and other staple articles which have been ordered by jobbers in much larger quantities, reminding the trade of old time orders. The hardening of prices on raw material may have caused some houses to stock up with goods of this character. Recent prices have been so low that they have little to fear of any further reduction. They may have done wisely in anticipating their future requirements in this way. Roofing Plates continue as scarce as ever, and jobbers state that they are unable to accumulate any stock, the goods being shipped out about as rapidly as they are received.

Notes on Prices.

Wire Nails.—During the past week the Wire Nail market has been steady with a slightly upward tendency. Manufacturers have withdrawn their outstanding quotations at low figures and are now naming $1.15 for carload lots at mill, a figure which is sometimes slightly shaded. The advance in the price of the raw material and the uncertainty in regard to the supply of fuel are the principal reasons for the strength which characterizes this line. The volume of business has, however, fallen off perceptibly, as the trade hesitate about placing orders at the advanced

prices which are ruling, buying only in such lots as are required to meet their present needs. Small lots from store in New York are held at $1.25 to $1.30.

Advices from Chicago.—Manufacturers report rather a quiet week. The advance made in factory prices has been well maintained, but buyers are not inclined to pay the great advance now asked on recent low prices. They are able for the present to supply their wants from jobbers having heavy stocks who are willing to sell at slightly lower rates than manufacturers. This is, of course, only a temporary condition, which may soon be expected to terminate. The higher price of Steel Billets and Wire Rods will probably prevent manufacturers from being in a hurry to reduce their quotations. Factory lots are quoted at about $1.20, Chicago. Jobbers quote small lots at the same price.

Cut Nails.—The Cut Nail market is without material change, though perhaps slightly firmer in the matter of price, in sympathy with the advances which have been made in Wire Nails. The demand is fair, but not especially heavy. The Eastern market is represented by the quotation of 95 cents to $1 for Nails delivered on dock in New York. Small lots from store are held at $1.10 to $1.15.

Advices from Chicago.—The condition of the market continues about as reported last week. Orders are coming in fairly well from jobbers in this vicinity and from various Northwestern points. Manufacturers quote 90 to 95 cents on 55 cent average. Small lots are selling at $1.05 to $1.10 from stock.

Barb Wire.—The demand is only moderate, but manufacturers are well supplied with orders. Prices are well maintained, the market being represented by the following quotations for Four Point Galvanized, delivered at the points named: Pittsburgh, $2.05 to $2.15; Cleveland, $2.10 to $2.20; Cincinnati or Allentown, $2.15 to $2.25; Chicago or New York, $2.20 to $2.30.

Advices from Chicago.—The advance in Western freight rates has had some effect on the Barb Wire trade, but not as great as might be expected. Western jobbers have had previous experience in stocking up on Barb Wire in times of low freights and will not risk being caught again. Manufacturers who had made special efforts to handle a larger trade from that section did not meet with satisfactory returns. Probably they would have done better if they had at the same time cut their prices, but this they were not willing to do with the higher rates ruling on their raw materials. Only a fair business is consequently reported for the week. Manufacturers are now looking forward to a quiet season extending over the summer months. Prices are maintained on a basis of $2 30 to $2.40 for small lots of Galvanized Barb Wire from stock, with 10 cents less for carloads.

Cordage.—The Cordage market continues in excellent condition as regards price, the advances which were recently made being well maintained. The demand is fair, but not especially heavy. It is thought not unlikely that slightly higher prices may rule before long.

Dixon's Cycle Lubricant.—This article is put on the market by the Joseph Dixon Crucible Company, Jersey City, N.J. In single gross quantities the price to the trade is $7.50 per gross, and in 5-gross quantities and over $6 per gross.

Phenix Meat Cutters.—Phenix Meat Cutters, manufactured by Sargent & Co., 37 Chambers street, New York, are sold at a discount of 66⅔ per cent. from the following list:

With Clamp, Galvanized.

	Per dozen.
No. 130, small family size	$48
No. 131, large family size	72
No. 132, very large size	120

With Feet, Galvanized.

No. 141, large family size	$60
No. 142, very large size	96

Glass.—The continued bad weather of the past week further curtailed the demand for Glass, though quotations for American Window Glass remain firm at 85 per cent. discount for single and 85 and 5 per cent. for double strength, in car lots. If the coal situation continues as at present it will seriously affect Glass factories depending upon coal for fuel and further decrease production. Plate Glass is quoted at 70 and 10 and 5 per cent. discount, with somewhat of a falling off in demand.

Old Metals.—There is no business of any amount in Old Metals, and prices are unchanged at their former level. The following quotations represent about the prices paid by dealers in this city:

Heavy Copper	₩ lb	6¾¢
Light and Tinned Copper	₩ lb	6 ¢
Heavy Brass	₩ lb	4½¢
Light Brass	₩ lb	3¾¢
Lead	₩ lb	2½¢
Tea Lead	₩ lb	2¼¢
Zinc	₩ lb	2 ¢
No. 1 Pewter	₩ lb	12 ¢
No. 2 Pewter	₩ lb	6 ¢
Wrought Scrap Iron	₩ gross ton	$7.00
Heavy Cast Scrap	₩ gross ton	7.00
Stove Plate Scrap	₩ gross ton	3.50
Burnt Iron	₩ gross ton	2.50

Old Rags, Paper, &c.—The volume of business does not expand to any extent. The market for Paper Stock is quiet, and only small lots are changing hands. Quotations for Old Rags, Paper, &c., are as follows, New York delivery:

No. 1 White Rags	₩ lb	3¼	@	3½¢
No. 2 White Rags	₩ lb	2	@	2½¢
Mixed Rags	₩ lb		@	2¼¢

Old Rubber.—The market is irregular and somewhat dull. Prices are soft, the following being the nominal quotations, New York delivery:

Car Springs, ton lots, ₩ lb.	@	$0.03½	
Rubber Shoes, carloads, delivered at factory, ₩ lb.	@	.03½	
Rubber shoes, less than carloads, ₩ lb	@	.03¼	
Large Hose, ₩ ton	@	12.00	
White Wringer Rolls, ₩ lb.	@	.03¾	
White Syringes, ₩ lb	@	.03¾	

The Crandall & Godley Company, 157–159 Franklin street, New York, are issuing a catalogue of Ice Cream Utensils and Machinery, showing Freezers, Storage Cans, Molds, Ice Crushers and the various paraphernalia needed in the manufacture and serving of ice cream.

Trade Notes.

A price list of interest to furnacemen will be found in this issue, in the advertisement of the Excelsior Steel Furnace Company, 38 West Monroe street, Chicago. Prices are given of all sizes of Hot Air Pipe, Elbows, Angles, Dampers, Safety Thimbles, Plaster Collars, Finishing Collars, Box Collars, Stack Collars and Boot Collars. A cut is also shown of a new Hot Air Damper. The coupon is again printed, worth $1 on a first order for $10 or over.

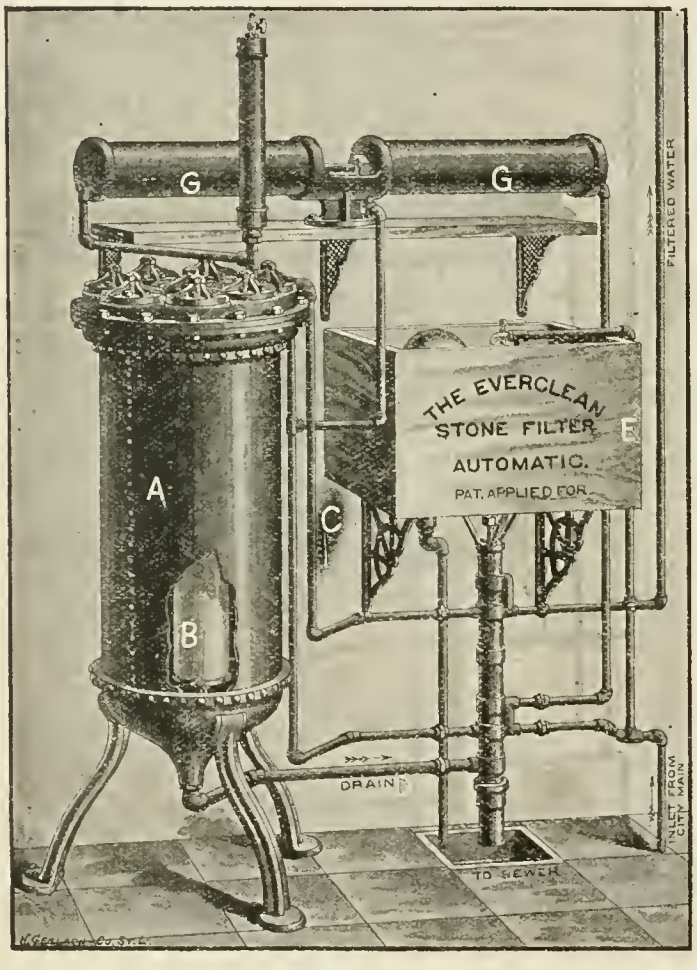
C. Mackintosh, who has had charge of the New York office of the McDaniel & Harvey Company for the past five years, severs his connection with them June 1. Mr. Mackintosh hereafter will be located in his own office at 61 Beekman street, New York, where he will transact a general commission business in Galvanized and Black Sheets and Spanish Tile for the Cuba trade, also handling Black Plates for tinning. We understand that Mr. Mackintosh will buy for a number of large concerns in New York and the New England States.

Albany Nickel Plating and Manufacturing Works, C. H. Angus, proprietor, Albany, N. Y., call attention to their superior facilities for nickel and brass plating and finishing, bronzing, tinning and japanning. The plant is also equipped with all the most approved appliances for doing every kind of polishing, plating, finishing and coloring. Mr. Angus is also prepared to do all kinds of machine work, manufacturing or jobbing, and makes the following remarks concerning his machine shop, brass foundry, &c.: The machine shop is furnished with modern labor saving tools, insuring the rapid and accurate execution of work. Particular attention will be given to manufacturing Specialties and Light Machinery, and correspondence is solicited with those desiring to contract in this line. The plant includes a first-class Brass foundry, and Brass Castings of all kinds will be furnished on short notice, guaranteed smooth and sound, true to pattern and of the best metal. Brass Gates and Rails, Store and Showcase Fixtures, Brass and Nickel Signs of any style and design made promptly to order. Where articles are produced complete in one establishment, carefully arranged for easy and rapid production, under the personal supervision of its head, it is obvious that better and cheaper work will be secured than where they are produced by different concerns. My facilities enable me to offer this advantage to my patrons.

Four new steamships are to be built in England for employment in the Anglo Canadian mail service in connection with the Canadian Pacific line. The vessels will be 572 feet in length, 62 feet beam, with a depth of hold of 42 feet and a load draft of 30 feet, making them the deepest transatlantic vessels afloat. This draft of water is rendered possible by the fact that the English and Canadian harbors have deeper water than the harbor of New York. The freight carrying capacity of each of the new ships will be 3550 tons, in addition to a coal bunker capacity of 3000 tons. The engines are to be of 21,000 horsepower, working the vessels to a speed of 20 knots an hour.

The Everclean Stone Filter.

The Stifel-O'Neil Home Comfort Company, 904 Pine street, St. Louis, Mo., have brought out a new form of filter in which they use Missouri Tripoli as a filtering stone. The apparatus consists of a filter shell or chamber, A, into which city water under pressure is admitted. Suspended inside of this chamber are a number of cylindrical stones, B, bored through their axes and at the top connected with pipe C, which leads to the reservoir for filtered water. The city pressure forces the water through the pores of the stone into the central channel and up into the reservoir. This comprises the whole filtering process proper. To clean the filtering stones when they get coated with mud the action is reversed, and the filtered water driven back from the central channel through the pores. This forces the mud off, and by opening the pipe D at the bottom of the chamber the mud is carried off. When the cleansing is complete the mud pipe closes and the flow of water resumes its normal direction. This cleansing process is absolutely automatic and the reversal of the current can be made to take place as often as desired, once a day or once an hour. The reversal of the current is governed by a tank or cistern E with interior float and valves to regulate its periodical filling and discharge. The action of the float operates a series of cup leathers attached to a stem extending down through a brass sleeve, F, underneath the center of the tank. These cup leathers in turn serve to open and close the connection between the filter and the sewer outlet and at the same time to open a connection between the city mains and the horizontal double cylinder G G placed over the tank. When the tank fills with water the sewer connection as the filter opens allows some of the water in the filtering chamber to pass out. The city pressure enters the upper cylinder at H and drives forward a plunger by the action or which filtered water is forced from the opposite cylinder through the pipe I into and through the filtering stones. After this action the tank E empties automatically by siphonage, the discharge pipe D to the sewer closes and the filtering process is resumed through the cleaned stones as in the first instance. Upon the amount of water admitted to the tank will depend the frequency of the cleansing process.



The Everclean Stone Filter.

The increasing number of mysterious fires throughout the country, most of which might be traceable to defective insulation of electric light wires, have stirred up the insurance companies to stimulated action in this matter. An insurance journal records the fact that in the city of Hartford, Conn., the Board of Fire Underwriters have recently employed an expert to make a thorough inspection, with the result of finding 57 stores and offices in the business part of the city, including two large hotels, utterly unsafe from defects in insulation of the electric light wiring. Similar conditions, no doubt, prevail in other cities.

It Is Reported—

Connecticut.

That E. Ward Willis' Hardware and furniture store, at VOLUNTOWN, was destroyed by fire on the 24th inst.

Illinois.

That Sullivan & Church's Hardware store, at WYOMING, was buglarized a short time since.

That William Lichtenberger, Hardware merchant of SAVANNA, has sold out his stock and fixtures to H. C. Rhodes. Mr. Lichtenberger has been engaged in the Hardware business for 35 years, and his retirement is due to a desire to give his entire attention to the development of an invention which he has perfected. He has conducted a Hardware store in SAVANNA for 17 years, and prior to that time was identified with the business at SHANNON and FREEPORT. Mr. Rhodes will conduct the business under the style of the Savanna Hardware Company.

That Charles Penticoff is building a new Hardware store at PEARL CITY.

That the Hardware stock of F. M. Swing, MASON CITY, has been purchased by Layman & Brother of Chicago, who will consolidate with Paul Enlows under the firm name of Enlows & Layman and conduct the business at the Swing stand.

That Blatt Bros.' new Hardware building at ELWOOD is nearly ready for occupancy.

That S. W. Dutton's Hardware store at TOWER HILL was burned to the ground on the 18th inst.

Indiana.

That fire on the 18th inst. damaged the hardware store of Wendling & Priest, ROACHDALE.

Iowa.

That O. F. Griffith of MOUNT PLEASANT has sold his stock of Hardware to Fernald & Co., composed of W. D. Fernald and N. D. Fernald, the former of MAPLETON and the latter of CHICAGO. Mr. Griffith has not yet decided as to his future conrse.

That W. H. Duke & Co. have purchased the Hardware stock of McKee & Gadd, DES MOINES.

Michigan.

That a new Hardware store has been opened at UNION CITY under the firm style of Spring & Conner.

That William Urie has sold his Hardware store at BURR OAK to Mr. Bordet.

That the Gunn Hardware Company of GRAND RAPIDS have disposed of their stock to Foster, Stevens & Co. The purchase includes the entire business of the former company, both wholesale and retail. The stock will be transferred as soon as possible to Foster, Stevens & Co.'s establishment, which is large enough to amply accommodate it. It is said that the purchase price was in the neighborhood of $125,000, and that the stock will inventory about $150,000. The Gunn Hardware Company were a stock company with a capital stock of $100,000, of which $85,000 was held by W. S. and W. A. Gunn. W. S. Gunn, the founder of the business, is a wealthy man, and his object in disposing of the stock is that he may be able to devote his whole time to other more lucrative enterprises in which he is interested.

That F. W. Moon, Hardware merchant at BELLEVILLE, has sold out his business to Dodge & Spaulding of DUNDEE, who will continue it on a larger scale.

That for the past three months the Hardware store at 89 Gratiot avenue, DETROIT, owned by Geo. J. Sexauer, has been systematically robbed. On the 21st inst., however, the thief was apprehended, being caught in the act of robbery. The miscreant proved to be a former employee of the store, access being obtained by means of a false key.

Minnesota.

That the West Side Hardware Company are a new concern at NORTHFIELD

That D. Q. Minar of WILLIAMSVILLE, N. Y., has removed his entire stock of Hardware, Tinware, &c., to ORIATT, Benzie County.

That Frank McKnight, dealer in Hardware, BUFFALO, has sold out his business.

That Miller & Nelson, Hardware merchants at WINDOM, have dissolved, Carl Nelson & Co. being successors.

That H. O. Shaw has opened a new Hardware store at SARGENT.

That W. T. Wilson & Co., Hardware merchants, WEST CONCORD, have been succeeded by C. W. Webb.

Nebraska.

That the Hardware store of C. M. Hayden, at WALLACE, was entered by burglars on May 12 and a large quantity of Cutlery, Whips, &c., taken.

New York.

That the WILLIAMSVILLE Hardware business of D. Q. Minar has been removed to ORIATT, Benzie County, Minn.

Pennsylvania.

That a handsome new front has been put in the Hardware store of Hoff & Bro., READING.

Bidding for Work.

The great waste of time and labor by the unsuccessful bidders in making estimates of cost on plumbing work from plans and specifications is a matter that is receiving increased attention. The interest is not confined to any one locality, and the master plumbers of New York in their meetings have given it serious consideration. The reason of this wasted energy is easily pointed out, for there are a number of plans of buildings that are open for bids at the present time, each one of which finds many firms ready to make an estimate. Architects' offices are watched carefully by all builders who have ever done any work for them, and in consequence all plans are figured on by many different contractors. As in other lines, builders devote themselves to specialties, but not being busy at the present time they are eager to be employed on any character of work; consequently, an architect who has had as many as 20 or 30 different builders working for him is now besieged by all for an opportunity to figure on each set of plans he makes. From the fact that these men have previously been devoted to special lines of buildings, dwelling houses, churches or factories, as the case may be, the sub-contractors to whom they apply for bids are not the same in any two cases: and, moreover, three or four bids are often asked from each division of sub-contractors. In this way it will readily be seen that as many as 80 or 90 bids might be made for a piece of work which, perhaps, is not worth over a thousand dollars.

Taking Advantage of Bidders.

The disposition to get the most for the money in these times is shown in a case which recently transpired in an architect's office, where over 20 bids were received for a complete contract. Later it was decided to reserve a portion of the work, and with the tabulated bids exposed to the contractors they were asked to make amended bids, leaving out a specified portion of the work. It can readily be seen that the highest bidder in making an amended bid under such circumstances would be tempted to go below the figures of the lowest bidder. Some of the contractors refused to make a second bid, and others say they will never again figure on plans coming from that office. If a job is of any considerable size, the preparation of an estimate will occupy the time of a master plumber at least a week, if he devotes himself to it alone and makes a careful account of the cost, and assuming that his time is worth but a little more than a journeyman plumber, his week's labor would amount to $30. In a case where there would be 70 different plumbers making an estimate for such a contract, it can readily be seen that the cost of the bids furnished would be about $2100, which probably would be more than the price of the job, to say nothing of the profit. It is stated that in making bids in this way the reputation of a plumbing firm for doing excellent work in the most careful manner, and with only first-class materials, counts for nothing; that while the owner of the building would greatly prefer to have none but men in whom he could place confidence figure on the work, the system permits men who are incapable and unreliable to figure and stand an equal chance of securing the work. Competition was asked a short time since for the plans and specifications of a building to cost $1,000,000, for which a $50,000 prize was offered, and, as a result, 189 competitors took part. It is fair to suppose that a man competent to draw the plans and write specifications for such a building would occupy at least one month's time in the work, and in the aggregate 189 months were consumed, or 15 years 9 months. It is also fair to suppose that a man capable of doing such work would be worth a salary of $3000 or $4000 a year, at a low estimate, or $300 a month, which makes the value of the time for working out these plans nearly $57,000. The prize awarded to the successful bidder was, as stated, $50,000, which would not nearly pay for the time spent on the plan.

The Lottery Feature.

Lotteries are prohibited by the Government, yet in the case cited 189 men are striving for a $50,000 prize, each with one chance in 189 of being successful. It has been suggested that architects in charge of buildings of any considerable size should see to it that only good contractors are permitted to bid on the different parts of the work, even though the contract may be let as a whole. If the architect were to name a select number of heating contractors, plumbing contractors, roofing contractors, and so on through the whole list, who would be called upon for bids, not only would his client be better served, but much injustice, or at least needless waste of energy, would be avoided. It is said that the plumbers in one of the large cities of Rhode Island have made an arrangement with the architects by which every plumber who bids on a set of plans is paid for the time spent in preparing bids in proportion to the amount of work to be done. In this way the architect is careful to select only such men as he thinks are fitted to do his work well. The successful competitor has the amount which he has been paid for making the bid taken from the price of the work which is awarded to him. The other bidders retain the money which has been paid them for furnishing the bids. The plan, we understand, has worked very satisfactorily and is worthy of consideration. It must be borne in mind, however, in adapting any strict rules in this matter, that young firms are constantly pushing ahead, and it would be wrong to deny them a chance to bid against the established houses in the business and so win for themselves the advanced reputation and position they are seeking.

The Proposed Class in Sheet Metal Work.

Professor Richards of the Pratt Institute, Brooklyn, has received up to date about a dozen applications from candidates for the proposed class for sheet metal work in connection with the Trade School of the institute, to which reference has several times been made in these columns. A number of inquiries from prospective candidates have also come in, some of which will, it is hoped, result, later on, in definite applications for instruction. We understand that the prospect is bright for the establishment of this new branch of trade school work. Those who intend to avail themselves of an excellent opportunity of securing a thorough education in sheet metal pattern cutting should not, however, delay in sending in their applications, as the opening of the class will depend entirely upon the extent of the interest shown in it by the trade. A few more pupils must be secured before definite action will be taken in the matter. The Trade School will open in September, but applications are desired as early as possible, so that the necessary preparations may be taken in hand.

Importations of foreign bituminous coal continue. During the week cargoes have been received at New York from Wales and Nova Scotia.

THE LETTER BOX.

Automatic Ventilation of Dwellings.

From B. N., *Minneapolis, Minn.*—It has always been a source of surprise to me, in looking over the literature pertaining to hot air work, that so little is said by manufacturers and writers in general on the subject of ventilation. My opinion is that if this matter was given more attention there would be less complaint about hot air furnaces, provided, of course, that the furnace had enough heating surface to warm the air. In this locality we are forced to use ventilating devices in connection with hot air furnaces or they would not give satisfaction. Here nearly every house of the better class is back plastered, has matched sheathing and building paper under the clapboarding, is fitted with double windows and provided with storm doors or vestibules. We build as nearly air tight as possible, so that it is absolutely necessary for us to have an exhaust in order to maintain a circulation of air. Believing that what we have been obliged to do may be of benefit to hot air furnacemen in other localities, who sometimes strike knotty problems in heating to be overcome, I will briefly set forth our method of securing automatic ventilation and circulation.

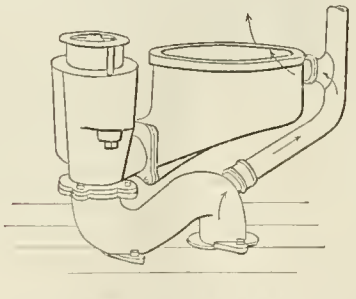
The method of which I write was introduced here some years ago by a Mr. Tilden, and is now used with various modifications by all of the leading hot air contractors. By this system the chimney flue of the furnace is made to serve the double purpose of furnishing draft for the furnace and an exhaust for ventilating pipes. For the purpose of illustration we will take a ten-room house, which is to be heated by a hot air furnace and ventilated. A large sized flue must be constructed for this purpose. It will not work if an ordinary 8 x 8 inch flue is taken. This would only furnish draft for the furnace and nothing more should be expected of it. The flue should be 12 x 16 inches, to make a really good job, in which to build an 8 inch tile stack as a special flue for the furnace. This heats the space around it into which the ventilating pipes are run. A good job, but not so permanent, can be done with a 12 x 12 inch chimney flue, with a 9 inch stack of No. 16 galvanized iron up the center for the furnace, with the ventilating pipes running into the surrounding space. Some very successful jobs have been put in with the ventilation running in the same flue as the smoke, but the flue in that case should be at least 12 x 12 inches, and a damper is required in the main ventilating pipe to shut off the air when starting a fire or when the draft is poor by reason of atmospheric disturbances.

Now, as to the arrangement of the ventilating pipes in the house. These are of tin and are usually 3¼ inches in diameter. They run from the baseboard of each room to the cellar, with 4½ x 6½ inch faces at the baseboard. In the cellar they connect with a main pipe which runs to the chimney. This is done when one flue is used for both smoke and ventilating. When the ventilating shaft is separated from the smoke flue, the vent pipes are run independently to the ventilating flue by short connections on each floor. By this arrangement an automatic system of ventilation and circulation is secured, which begins to operate as soon as a fire is kindled in the furnace, creating an upward draft in the chimney.

If the house is built with only an 8 x 8 inch flue for the furnace it should not be used for ventilation. In such a case the ventilating pipes should be run to the attic, connected into one main and run through the roof, because the flue is not large enough to serve for both purposes and the furnace will not heat on account of insufficient draft.

By-Passes: What They Are, and How to Avoid Them.

From OLIVER TWIST.—The word by-pass seems to belong exclusively to American plumbing literature, as it is seldom found in the works of authors



By-Passes: What They Are and How to Avoid Them.—Fig 1.—*A Water Closet By-Pass.*

from the other side of the Atlantic. Webster defines the word "by passage" as "a passage by the way or a by-way." As applied to plumbing practice it means a blunder in the arrangement of traps and vent pipes in a plumbing system by which the sewer gas is allowed to pass the trap and thus escape into

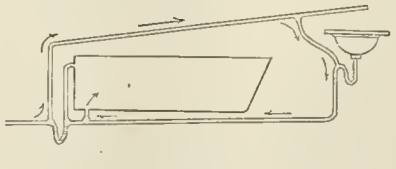


Fig. 2.—*By-Pass Between Bath and Lavatory.*

the building. Local vents or vents from the hoods of urinals, the bowls of water closets, &c., are frequently the cause of the trouble, as they are often found connected to a trap vent, as shown in Fig. 1. A similar case was seen by the writer not long ago in connection with an expensive closet of the elevated flush tank variety, having a bowl vent which was particularly desired by the owner as a sanitary measure, and yet it was allowed to be attached to the soil pipe above the highest fixture, being practically the same as Fig. 1. These vents, of course, should have been carried up separately through the roof, or to the open air. If the water from a fixture passes through more than one trap on its way to the house drain and both traps are vented there is sure to be a by-pass, as may be seen in Fig. 2. As a general rule every fixture should be furnished with a separate trap placed as near the fixture as is practicable. All traps are better if vented, even if they are of the anti-siphon pattern, as a trap that is not vented has a dead end which accumulates sewer gas, having a very corrosive action, which materially lessens the life of a trap. Laundry tubs are an exception to this rule, however, as they are usually allowed, when placed in series of two or three, to be protected by one trap. Vent pipes should be connected to the crown of the trap in all cases and on the sewer side. The word by-pass is also used in speaking of a branch taken from a water pipe, as stated in the answer to "A. J. C.," in *The Metal Worker* of May 5.

Problem in Drainage.

From M. J. F., *Minersville, Pa* —I would like to hear from the readers of *The Metal Worker* on the following subject: I want to run a drain pipe to creek which is 2 feet lower than the bottom of the cellar. The stream flows about 8 miles an hour. The question is, if I run a drain with the stream is there enough suction to keep the cellar dry when the water in the creek rises 2 feet above the level of the bottom of the cellar?

Note.—We submit this question hoping to hear from some of our readers who have had experience where the conditions were similar. The natural supposition is that water will rise to its level and if it was 2 feet higher in the creek than in the bottom of the cellar it would seem that the water would rise in the cellar to the same hight, but as the high velocity of the current will produce considerable suction a different result may be possible.

Utilizing Surplus Heat.

From F. L, *Baltimore, Md.*—I have been interested in the article of "Experimenter" in *The Metal Worker* of May 26, on heating a room over the kitchen from a range with a horizontal boiler. I would like to have some information on the subject, as I have a room to which I should like to carry hot water heat by connecting with the boiler, but I have an upright boiler. Will you kindly inform me whether I can take hot water from the top of the boiler, or if it is better to take it by a branch at the side coupling? Should the return from the radiator be connected with the cold water supply at the top of the boiler or with the pipe from the bottom of the boiler to the water back?

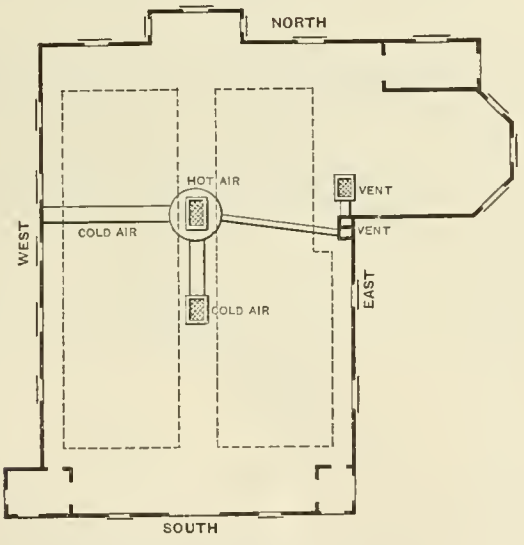
Answer.—The first thing to be considered in heating from a range boiler is whether the water back has sufficient

capacity to heat the extra amount of water required. This being decided, it is an easy matter to pipe the job. The hot water flow pipe to the radiator may be connected either with hot water service pipe at the top of the boiler or by means of a branch at the side coupling, as preferred. There are some advantages in connecting at the top of the boiler. The return pipe from the radiator should always connect with the water back pipe between the bottom of the boiler and the water back. The radiator should have an air cock at the top to let the air escape as the radiator is filled. A stop cock should be put on the pipe that leads to the radiator to prevent the radiator being heated in the summer when no heat is desired.

Wants a Better System.

The letter from "CÆSAR" is reprinted with some additional comments which came in later, as his plan, by an error, was separated from his letter in *The Metal Worker* of June 2.

From CÆSAR, *Louisville.*—In *The Metal Worker* of May 12 I note an article from "W. S. G.," Penbrook, Pa.



Wants a Better System.—Plan by Cæsar.

The only comment necessary is that "W. S. G." did not roast the architect sufficiently. The plan offered by the latter is well calculated to heat cellar to about 100° and auditorium 40° to 50°. As this is not desirable I offer the following with diagram of adjustment. I would place furnace as per diagram and take the hot air through a 30 x 36 face plate and border directly over furnace. Ten feet toward front of building I would place a register having three-fifths of the capacity of the hot air register and with pipe of three-fifths of the capacity of the hot air pipe, connecting it to a pit under the furnace. The other two fifths of the capacity of the hot air register I would use in a pipe connected to pit under furnace and run to outside air. I would place vent register as designated and give both pipe and register the same capacity as the vent flue. Let "W. S. G." use faces and borders only on this job. Such a plant will heat this building with 25 per cent. of the fuel that would be consumed in plan offered by the architect. If "W. S. G." had done the proper thing in this case he would have firmly passed the job and refused to figure on it. It is not well for a heating man to waste his time on such jobs as the one offered, in which such dense ignorance of the laws governing warm air heating is displayed. It is my experience that it requires a full lifetime of close application to learn the entirety and details of our business, yet we find some people who after four or five years' experience have mastered the details of every business. Comment is unnecessary.

It will be noticed that there are but three registers on my plan and the sum total of the cold air must equal the total of the hot air. We have a church in this city that is 136 feet long, 47 feet wide, with a mean hight of 41 feet, that is heated on this basis with less than 400 bushels of soft coal for the entire winter, and there has been a continuous fire in one or two furnaces. If any good brother is inclined to doubt this statement the job is here and open for his inspection.

Front Wall Traps.

From S. F. G., *Washington, D. C.*—In reply to the query of "L. J. S.," in *The Metal Worker* of June 2, I wish to say, after having had an experience with front wall traps in house drainage of over 20 years, I hold that they do more harm than good where the building is properly plumbed. They could be made serviceable if the vent to the top of the house were heated by gas or a hot flue, otherwise they are altogether a delusion. In this city they are mandatory and have caused no end of trouble. Their location and the method of putting them down have been changed by the inspectors many times, and the same may be said of the air inlet, which proves my assertion. Until the vent pipes are heated to force the current of air in the proper direction their purpose will be very doubtful.

From J. O. C., *Summit, N. J.*—In reply to the inquiry of "L. J. S.," New York, in regard to front wall traps, that appeared in *The Metal Worker* June 2, I would say that I am a plumber and an advocate of the trap and fresh air inlet at front wall. But instead of inside I would much prefer it on the outside, set in a brick wall with flagstone ever it, with manhole and cover and the trap to have a brass trap screw, so it can always be readily cleaned. This trap, the main trap as it is most always called, I think is an indispensable attachment to a plumbing system. To be sure it adds considerably to the cost when properly put in, but in the long run it pays for itself. When the fresh air inlet is carried 20 to 30 feet from the house, as is the case here, I fail to find any bad smells coming from it, as I don't think the flushing of any fixture in the house, with the fresh air opening 20 to 30 feet away, is sufficient to force the bad air out before a reverse action takes place and carries it, with fresh air, out at the roof.

We may take the most secure cast iron plumbing job or soil pipe and in time, owing to the expansion and contraction of the joints, it would be unable to stand the water test, thereby leaving openings for the escape of sewer gas, which would be remedied in a great measure by the main trap and fresh air inlet at the front wall. In cases of split hubs and sand hole pipe and jobs that have never stood the water test, the trap becomes an important factor, or in cases of tile pipe that has been laid with the cement joints not cleaned out and leaving rough edges inside the pipe, which hold and accumulate filth, I consider the trap a great benefit.

As the fresh air acts as a purifier, and its constant circulation through the system serves to keep the system in sweet and good order and free from any disagreeable or poisonous gases, I do not see how it can be dispensed with. In cases of repairs also where a closet or a fixture has to be so opened that the waste pipe is left open without any trap in direct connection with the room, the main trap and fresh air inlet performs an important office. As for me, I fail to see any good argument for not putting in the main trap and fresh air inlet outside front wall. It presents itself to my mind as a question of sewer gas or fresh air, and I much prefer the fresh air, which has led me to recommend at every opportunity the main trap and fresh air inlet, and I always feel that I have done my duty as near as possible from a sanitary standpoint by doing so.

Cement for Glass.

From W. P. E., *West Branch, Mich.*—Will *The Metal Worker* or some of its readers please give me the receipt for a preparation that will cement glass to tin for cream can gauges? I have tried a good many things, but without success. I can get them to hold for a short time, but when they are scalded and cleaned they begin to leak.

Note.—We trust this appeal to our practical readers will secure our correspondent the assistance he wishes. From one of the workshop receipt books the following is taken for uniting glass and metal: Melt carefully 160 parts, by weight, of finely pulverized collophony; 40 parts of white wax and 80 of colcothar. Add to the melted mass 20 parts, by weight, of Venetian turpentine. Remove from the fire and stir cement until cold with a wooden spatula. Apply the cement when warm.

THE METAL WORKER SKYLIGHT COMPETITION.

Second Prize Essay.

BY JOHN C. DRESSEL.

In making a metallic skylight, the mechanic has the same general problems to contend with that a carpenter has in constructing a hipped roof and laying out the various rafters for the same. The carpenter has a plate or foundation to start with, and the different rafters, which he terms the common rafter, hip rafter and jack rafter. So in constructing a skylight we will be compelled to impose on

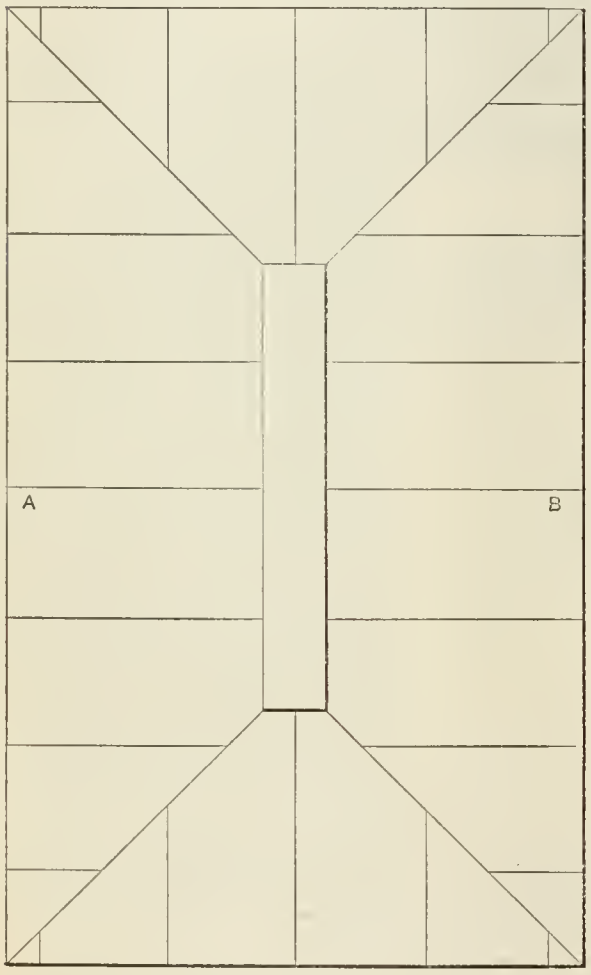


Fig. 1.

some of our carpenter friend's good nature and borrow a few of his familiar terms. Instead of using his plate we have substituted the word "curb," which will be the foundation for starting to build a skylight. Instead of using his rafters we will use bars, hence we have common, hip and jack bars.

The Metal Worker did not require a ventilator skylight, but as skylights are for the purpose of giving light in dark quarters, as dark places usually accumulate moisture, and moist places disease, there is a necessity for ventilation. We have, therefore, submitted plans and patterns for a ventilated skylight, as the same general steps are necessary to produce a light with a plain ridge as a light with a ventilator.

Let Fig. 1 be the plan of a skylight which it is desired to build.

Fig. 2 represents a sectional elevation of Fig. 1 on line A B, the pitch of the light in this case being one-third pitch.

Fig. 3 shows profile of curb bar. It will be noticed by inspection that it is formed of one piece of metal and of such a shape as to form a trough.

The various bars are attached to this curb in such a manner that all condensation will empty into this trough. By punching holes where marked in Fig. 3 the water is allowed to escape to the outside of curb. These holes should be so punched as not to come directly opposite each other, and be about ½ or ¾ inch in diameter, and should

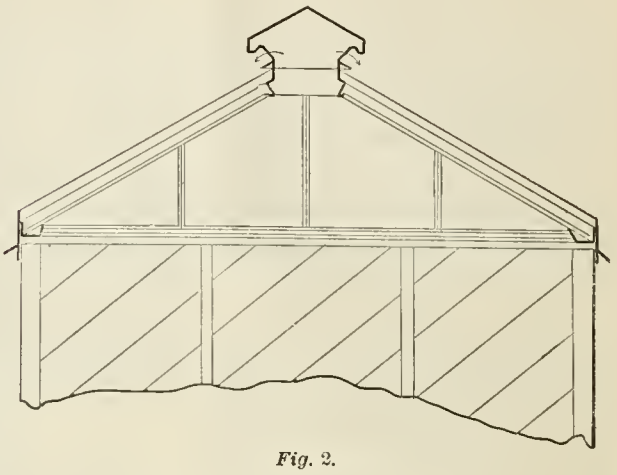

Fig. 2.

furthermore be punched before the metal is formed up. Also punch holes about ¼ inch in diameter at A to allow the escape of any water that may accumulate under the glass. These holes can be punched after the light is made up. The projection B is not really necessary, but it will be found an improvement, as it will throw the water out from the bulkhead underneath it. The manner of securing skylight to bulkhead is also indicated in Fig. 3.

Fig. 4 represents broken elevation of curb.

Fig. 5 shows profile of one of the common and jack bars. A B represents copper clip to be used in securing caps

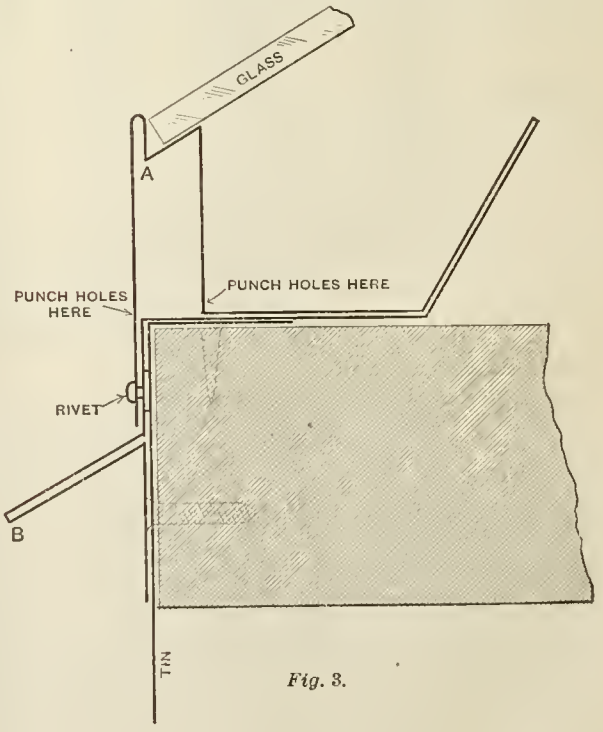

Fig. 3.

after the glass is in. The copper clip is made of sheet copper, about 14 or 16 ounce, and cut about 1½ x 2½ inches in size. The number of clips necessary to each bar is left to the option of the mechanic and as the case may require. Punch a hole, using a ½ or ⅝ inch chisel for the purpose, lengthways with the bar, and insert copper clip, as indicated by line A B, Fig. 5. By bending the ends of the cop-

per clip toward each other and hammering flat it will have the appearance of Fig. 6.

We are now ready for the cap. Let Fig. 7 represent profile of cap. Punch a hole, using same size chisel as for bar, or large enough to allow copper clip to pass through. The hole is to be punched at C, Fig. 7, and after laying glass on bar and then putting on cap we have in general appearance Fig. 8, of which Fig. 9 is a broken elevation. A B, Figs. 8 and 9, should be bent down so as to hug close to cap. It will be readily seen that in case of breakage a

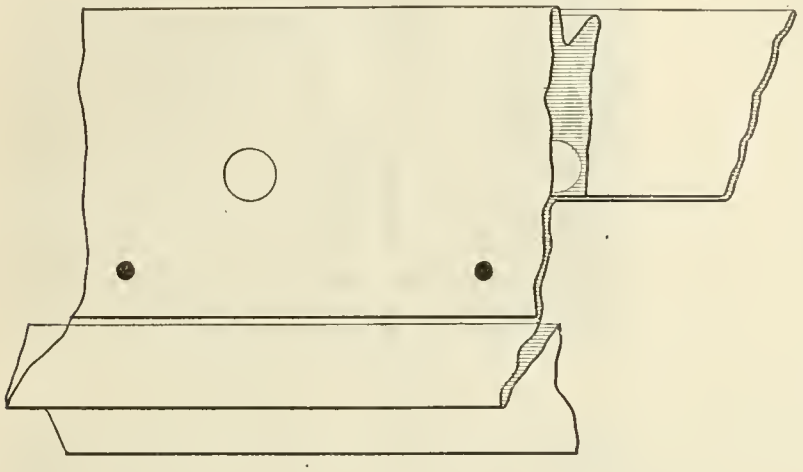

Fig. 4.

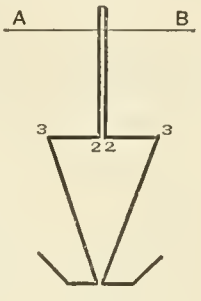

Fig. 5.

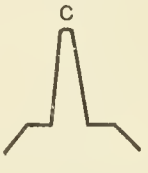

Ftg. 7.

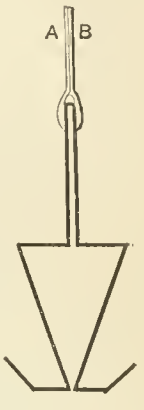

Fig. 6.

new glass may at any time be easily inserted by simply straightening the copper clip A B and removing the cap.

FINDING LENGTH OF BARS.

We are now ready to start getting out the light. Let us first ascertain the length of the various bars. Let A B E S T D, Fig. 10, represent one quarter of plan, Fig. 1, enlarged for convenience sake. At right angles to line A B lay off dotted line, as shown. On this line lay off the desired hight or pitch you wish skylight, in this case one-third pitch, as at C. Then A C will be the length of the common bars. Let me here mention that all measures are taken on the glass

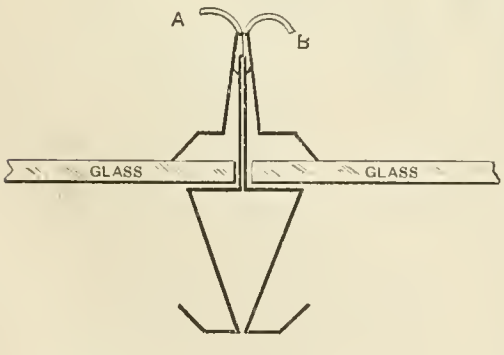

Fig. 8.

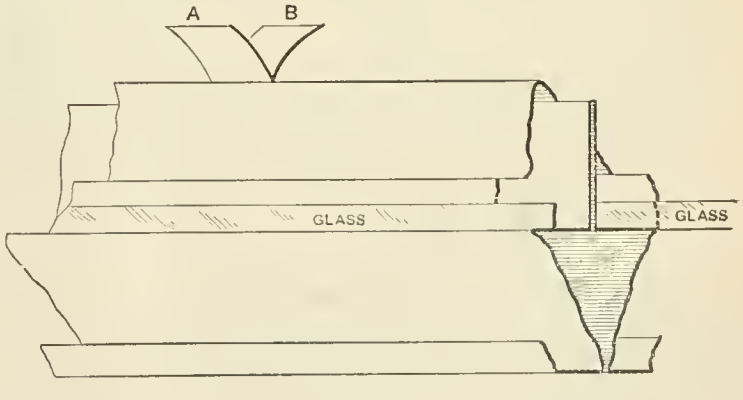

Fig. 9.

line. At right angles to D E lay off dotted line, as shown at F, making the space E F the same as the space B C. D F will therefore be the length of the hip bar. G H, J K, M N, P Q represent different jack bars, and H, K, N, Q where they intersect with hip bar.

At right angles to hip bar, line D E, lay off dotted lines from H, K, N, Q until they cut line D F, as shown by I', L', O', R'. At right angles to G H lay off dotted line I. With space eqnal to H I' lay off H I, establishing point I. G I will therefore be the length of one of the jack bars. The lengths of the others are obtained in the same manner—that is, laying off dotted lines at right angles to jack bars where they intersect with hip line D E, and making the space K L equal to K L', and space N O equal to N O', and space Q R equal to Q R'. J L will be the length of one, M O of another, and P R of another of the jack bars.

LAYING OUT PATTERN FOR CURB.

Having now established the different lengths of the various bars, we are ready to proceed with the laying out of the patterns. Let us begin with the curb or foundation, numbering the various points of curb as shown in elevation, Fig. 11. The next thing we want is a plan to obtain pattern from. At right angles to base line 5 6 drop perpendicular line 7. At right angles to line 7, at any convenient point, draw line 7', as shown; also drop perpendicular line 3. Parallel to line 7', and with space between 7' and 3' equal to space between lines 7 and 3, draw line 3', as shown. Then a line drawn as A B through the points where lines 3, 3' and 7, 7' intersect will be the necessary miter line. Drop perpendicular lines 8 6, 9 10, 1, 2, 4, 5, 13, 11, 12, cutting miter line A B, as shown. At right angles to perpendicular line 3 of elevation lay off stretchout of curb (1 to 13), as shown. At right angles to stretchout line erect perpendicular lines, as shown in pattern. Parallel to stretchout line drop lines from the various points obtained on miter line A B to their corresponding numbers on stretchout, as indicated by dotted lines. Then a line traced through the points thus obtained in stretchout will be the desired pattern.

As all measures are taken on the glass line (the glass line of curb is point 11), one would necessarily in this case want two sheets twice the length of A D, Fig. 10, with a miter on each end, also two sheets twice the length of D T, Fig. 10, with a miter on each end, measures being taken on line 11 of pattern.

The holes spoken of in Fig. 3 are shown on the pattern and should be punched as shown in pattern. The line X X

is merely to show what distance the holes are to be from the edge of the sheet, as will be readily understood by referring to Fig. 3.

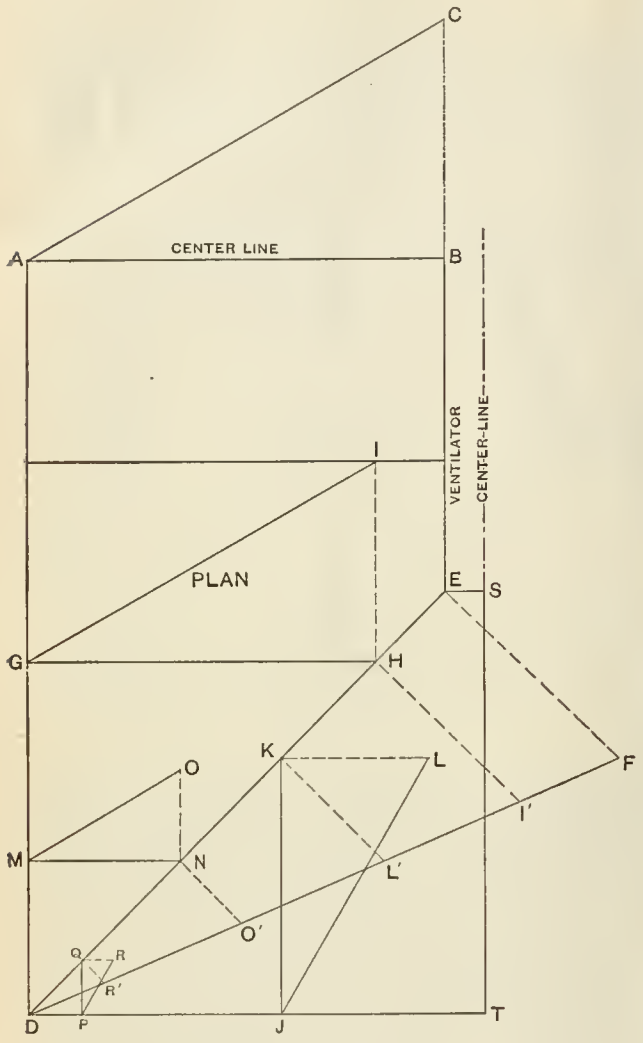

Fig. 10.

PATTERN FOR COMMON BAR.

In Fig. 13 draw line A B. At any convenient point, as at C, and at right angles to A B erect perpendicular line D, making space C D equal to space C B of Fig. 10. Also make space C E, Fig. 13, equal to line A B, Fig. 10. Then a line drawn from E to D would be the length of the common bars.

Point 11 of curb being the glass line, and the line D E being the glass line, place the profile of curb at E, as shown. At any convenient point and at right angles to line D E lay off indefinitely line F G. 2 3 of common bar, Fig. 5, being the glass line, place the profile of bar against line D E, as shown. Draw lines parallel to D E through the various points of bar profile until they intersect with curb and cut line C D, as shown. Finish drawing profile of ventilator, as shown, making glass line and condensation trough of ventilator equal to 2 3 and 4 5 of common bar. Lay off stretchout on F G, as shown. Draw lines through the various points of stretchout parallel to line D E. Then drop lines at right angles to D E, from the various points where lines of bar intersect with curb and ventilator to stretchout, as indicated by dotted lines, until they cut corresponding numbers of stretchout. Then a line drawn through the points thus obtained in stretchout will be the necessary pattern for one of the common bars.

Referring to Fig. 1, we find we want eight bars like this.

PATTERN FOR VENTILATOR.

Having the ventilator now close at hand we may as well get out the pattern for that before we proceed any further. Taking profile of ventilator produced in Fig. 13, and numbering the various points as indicated in Fig. 14, next draw center line indefinitely, as shown by line A B. On this line lay off stretchout 1 to 14, as shown. Through these points of stretchout and at right angles to A B draw lines indefinitely, as shown.

Then from the numbered points of profile drop lines to corresponding numbers in stretchout, as shown by dotted

Fig. 12

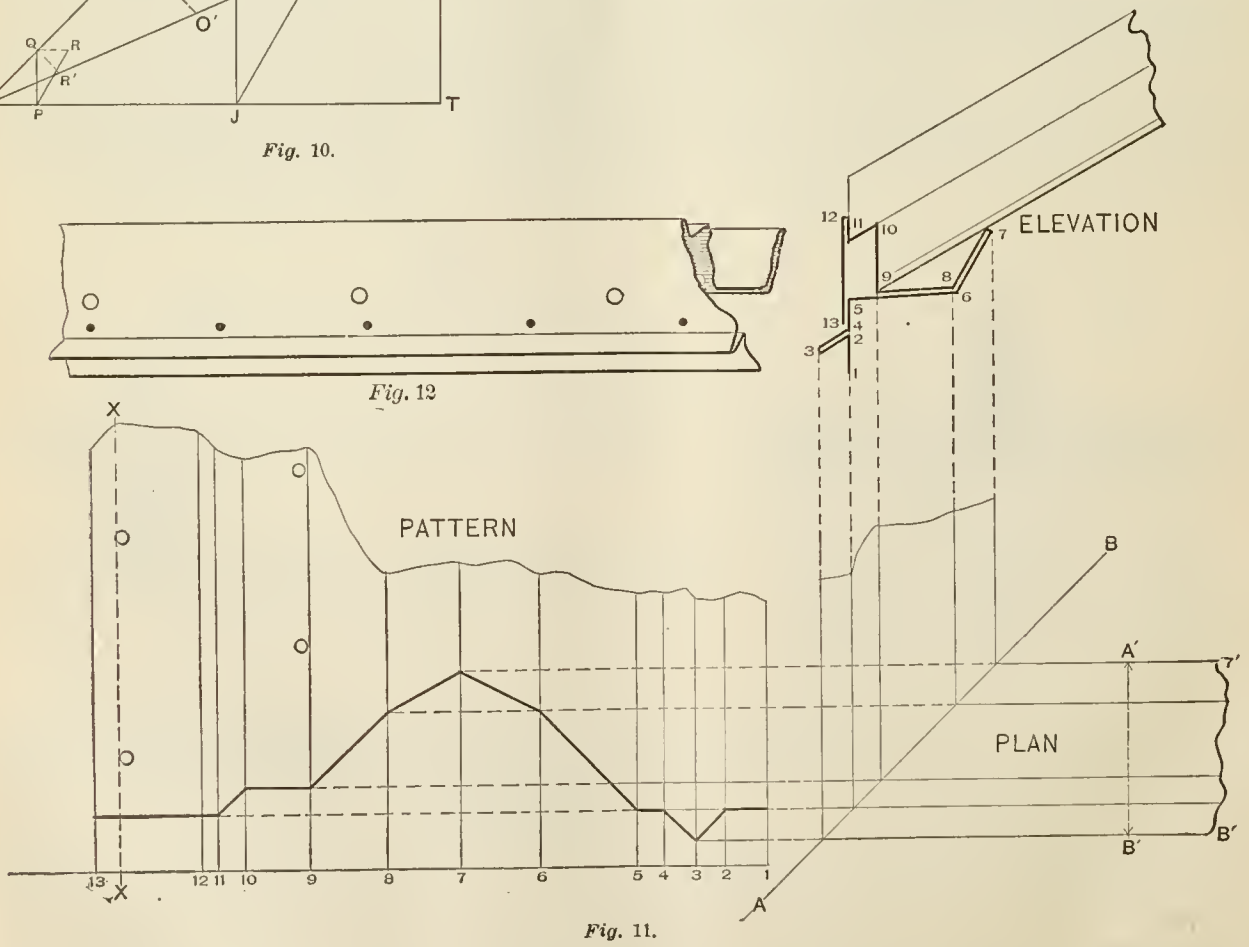

Fig. 11.

Fig. 12 again shows broken elevation of curb. It will now be necessary to have an elevation to correspond with plan of Fig. 10.

lines. Then a line drawn through the points thus obtained in stretchout will be the pattern for the end miters of sides of ventilator, point 5 being glass line. Therefore, a sheet

twice the length of E B, Fig. 10, with a miter cut on each end—that is, measuring on line 5 of pattern—will produce one side of ventilator ; or laying off the pattern on the opposite side of center line it will be found that line 5 is just twice the length of E S, Fig. 10, and, therefore, the pattern of one end of the ventilator.

C and C show side and end view of a brace, which is to be put in ventilator between the common bars. D, D represent holes for ventilation, and may be as large as the space between 8 and 9 will permit and as close together as may be desired. Fig. 15 shows broken elevation of ventilator made up. The vent holes should be backed with wire screen to prevent the entrance of insects, &c. This screen should be put on before the ventilator is put together.

It may have been observed before the reader has got thus far that these patterns are applicable to a skylight of any dimensions. The mechanic has therefore to be careful to make quarter plan, Fig. 10, to correspond with the size of skylight wanted, and make the incline of pitch the same in all cases ; or, if a different pitch of light is desired, the same general steps are necessary to produce the reqnired patterns as are necessary in this case. The only difference would be that different profiles would be produced in the curb ventilator and hip bars. Therefore, if a light of a different size but of the same pitch as the one here submitted is desired, the mechanic would only have to shift his patterns to correspond to the different lengths of the various bars, the curb and ventilator, as would be

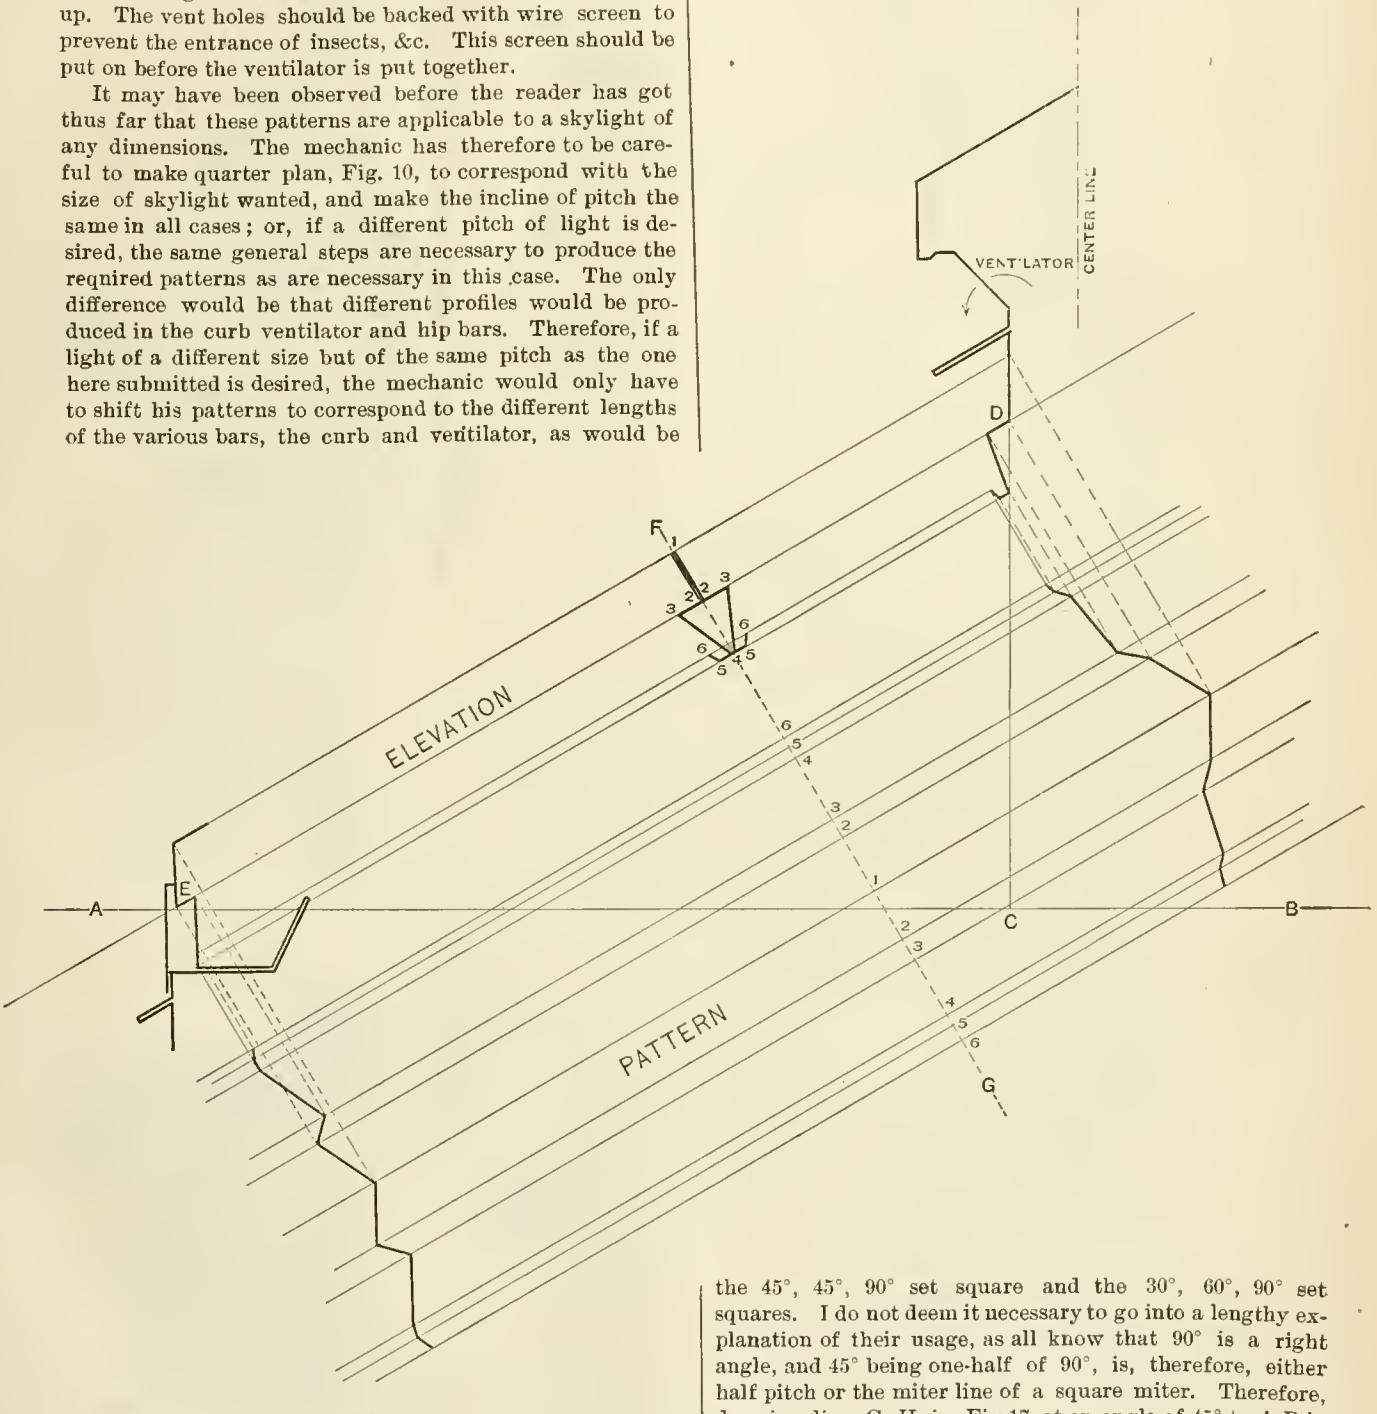

Fig. 13.

produced by a plan of a different size. The miters for the various parts will always be the same as they are in this case for the same pitch. Good judgment will therefore be necessary to make the various bars, &c., of sufficient size to carry the weight, which would necessarily be greater in a light of larger dimensions.

PROFILE OF HIP BAR.

We are now ready to produce the profile of hip bar. Fig. 16 shows the method proposed, it being drawn to correspond in size to plan, Fig. 10. Fig. 17 shows the same method as proposed in Fig. 16, the pitch in both cases being the same. Fig. 17 is drawn in detail, and as the same steps are necessary in both figures to produce the desired results, we will therefore use Fig. 17, as it will be the more readily comprehended.

Again draw elevation as in Fig. 13 (in Fig. 17 it being in detail), using only such portion of ventilator as the bars would come in contact with, as indicated by 1 2 3 4 5 6 of ventilator in Fig. 17. I believe most men who do this kind of work are accustomed to the use of the T-square and the various set squares that are used by draftsmen, such as the 45°, 45°, 90° set square and the 30°, 60°, 90° set squares. I do not deem it necessary to go into a lengthy explanation of their usage, as all know that 90° is a right angle, and 45° being one-half of 90°, is, therefore, either half pitch or the miter line of a square miter. Therefore, drawing line G H in Fig 17 at an angle of 45° to A B in elevation of same figure, we have center line of hip bar, as represented by line D E of Fig. 10.

At right angles to A B of elevation drop lines to G H in plan, as indicated by dotted lines, using only such portions of curb bar as would be required to find where hip bar would intersect with curb in plan ; also drop lines to G H, as indicated from ventilator bar. We therefore have one-half of plan. To produce the other half, lay off at right angles to lines 9, 10, 11, 12 of curb and 1, 2, 3, 4, 5, 6 of ventilator where they intersect with line G H of plan, drawing balance of plan as shown on right side of line G H.

At any convenient point draw line K L, as shown in plan, at right angles to G H. Now we necessarily want the same bearing for the glass to rest on on hip bar as we have

on the common bars. Therefore we have G H in plan as center line of hip bar; and I J in elevation as center line of common bars. Transfer the spaces 2 3, 4 5, 5 6, using line I J as center, to K L of plan, using line G H of plan as center. Through the spaces thus obtained on K L of plan, and parallel to G H, draw lines 5, 6, 3 until they intersect with plan of curb and ventilator, as shown, extending lines 3, 6 of hip bar through line 9 10 of curb bar in plan until they cut line 11 12 of curb bar.

At any convenient point and parallel to line G H of plan draw line A′ B′. At right angles to G H draw from point S the line cutting A′ B′ at S′. Also at right angles to G H of plan draw line, as shown, from point T indefinitely. With space equal to B D of elevation lay off from the line A′ B′ of diagonal section the point D′. Then a line drawn from point S′ to D′ would be the glass line of hip bar. Next draw line 5′ 6′ parallel to A′ B′, as shown in diagonal section, making the space between line A′ B′ and

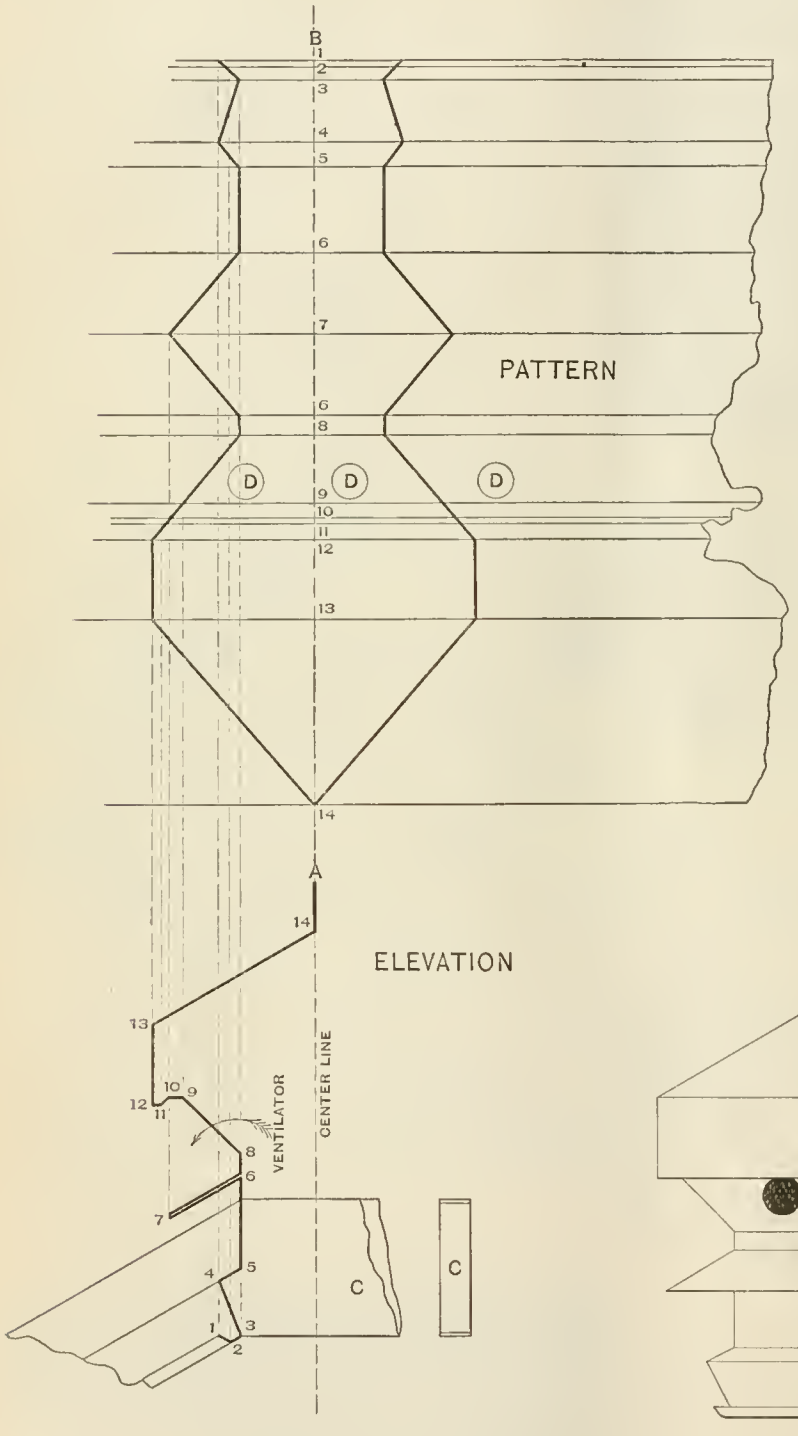

Fig. 14.

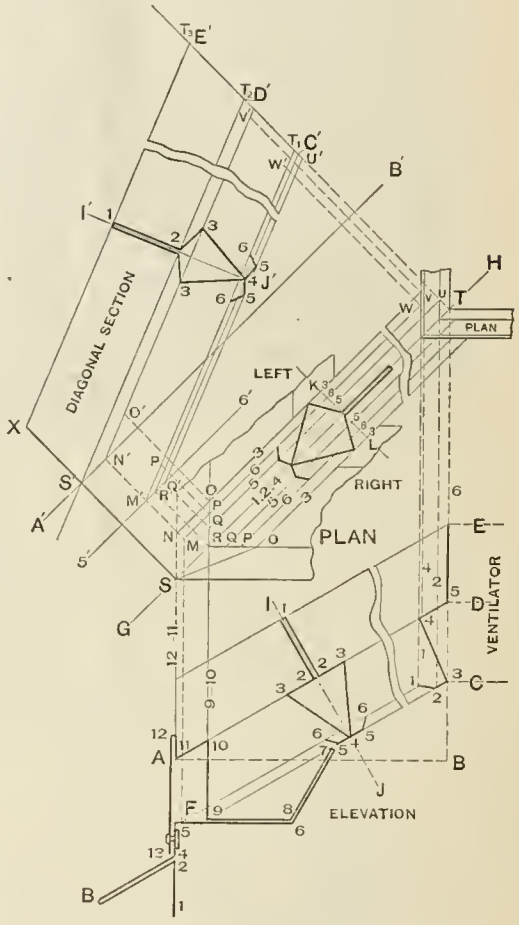

Fig. 17.

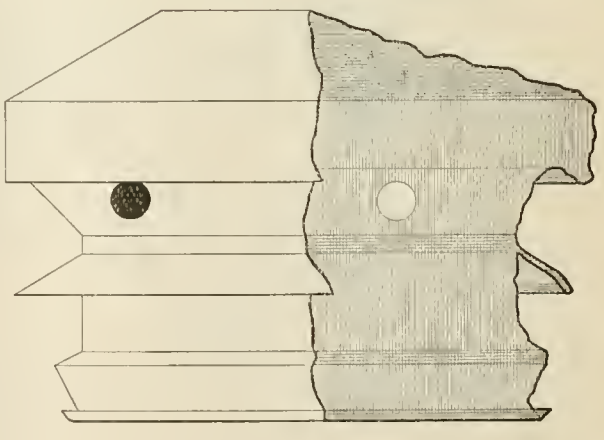

Fig. 15.

This operation is necessary to establish profile of hip bar, as will be shown later. Next extend line 6, as shown in elevation, through curb by dotted line until it strikes line 5 6 of curb at F. From F drop dotted line at right angles to A B of elevation until it cuts line 6 of plan, establishing point M in plan. We now have points S, M, N, O, P, Q, R in curb plan, of which S O P Q R is the plan of miter in curb and T V U W is plan of miter in ventilator.

It will be necessary, however, to obtain a diagonal section through hip bar before we can obtain profile of hip and the correct miter points for the pattern.

5′ 6′ equal to space between lines A B and 5 6 of elevation. At right angles to G H of plan from point M draw dotted line cutting line 5′ 6′ at M′ and cutting line A′ B′ at N′. Also draw dotted lines, as shown, from points R, Q, as shown in plan, cutting line 5′ 6′ in diagonal section at R′ Q′. From points thus obtained in diagonal section draw lines parallel to line S′ D′ until they cut the indefinite line drawn from point T in plan. Next lay off point E′ of diagonal section, making it the same distance from D′ as the space between D and E of elevation. From E′ and parallel to S′ D′ draw line cutting line S S′ at X.

We are now ready to lay out profile of hip bar. At any convenient place and at right angles to S' D' draw line I' J'. I J' is therefore the center line of profile of hip bar. With space equal to 2 3 of common bar lay off the spaces 3, 3 on the line drawn from the point N'. Then a line drawn from point 2 on center line of hip bar, diagonal section, to points 3, 3 would show the profile of that portion of hip bar upon which the glass rests.

From points 3, 3 in diagonal section draw lines to center line where it intersects with the line drawn from point R', establishing the point 4 of hip bar. Again using the line I J of elevation as center, and with space equal to 4 5, establish the points 5, 5 in diagonal section hip bar, using the line I' J' as center. Lay off points 6, 6 of hip bar on line drawn from point M', making them the same distance from the line I' J' as 6, 6 are from the line I J of elevation. Connecting points 4, 5, 5 and 5 6, 5 6, as shown, in diagonal section we have the complete profile of the hip

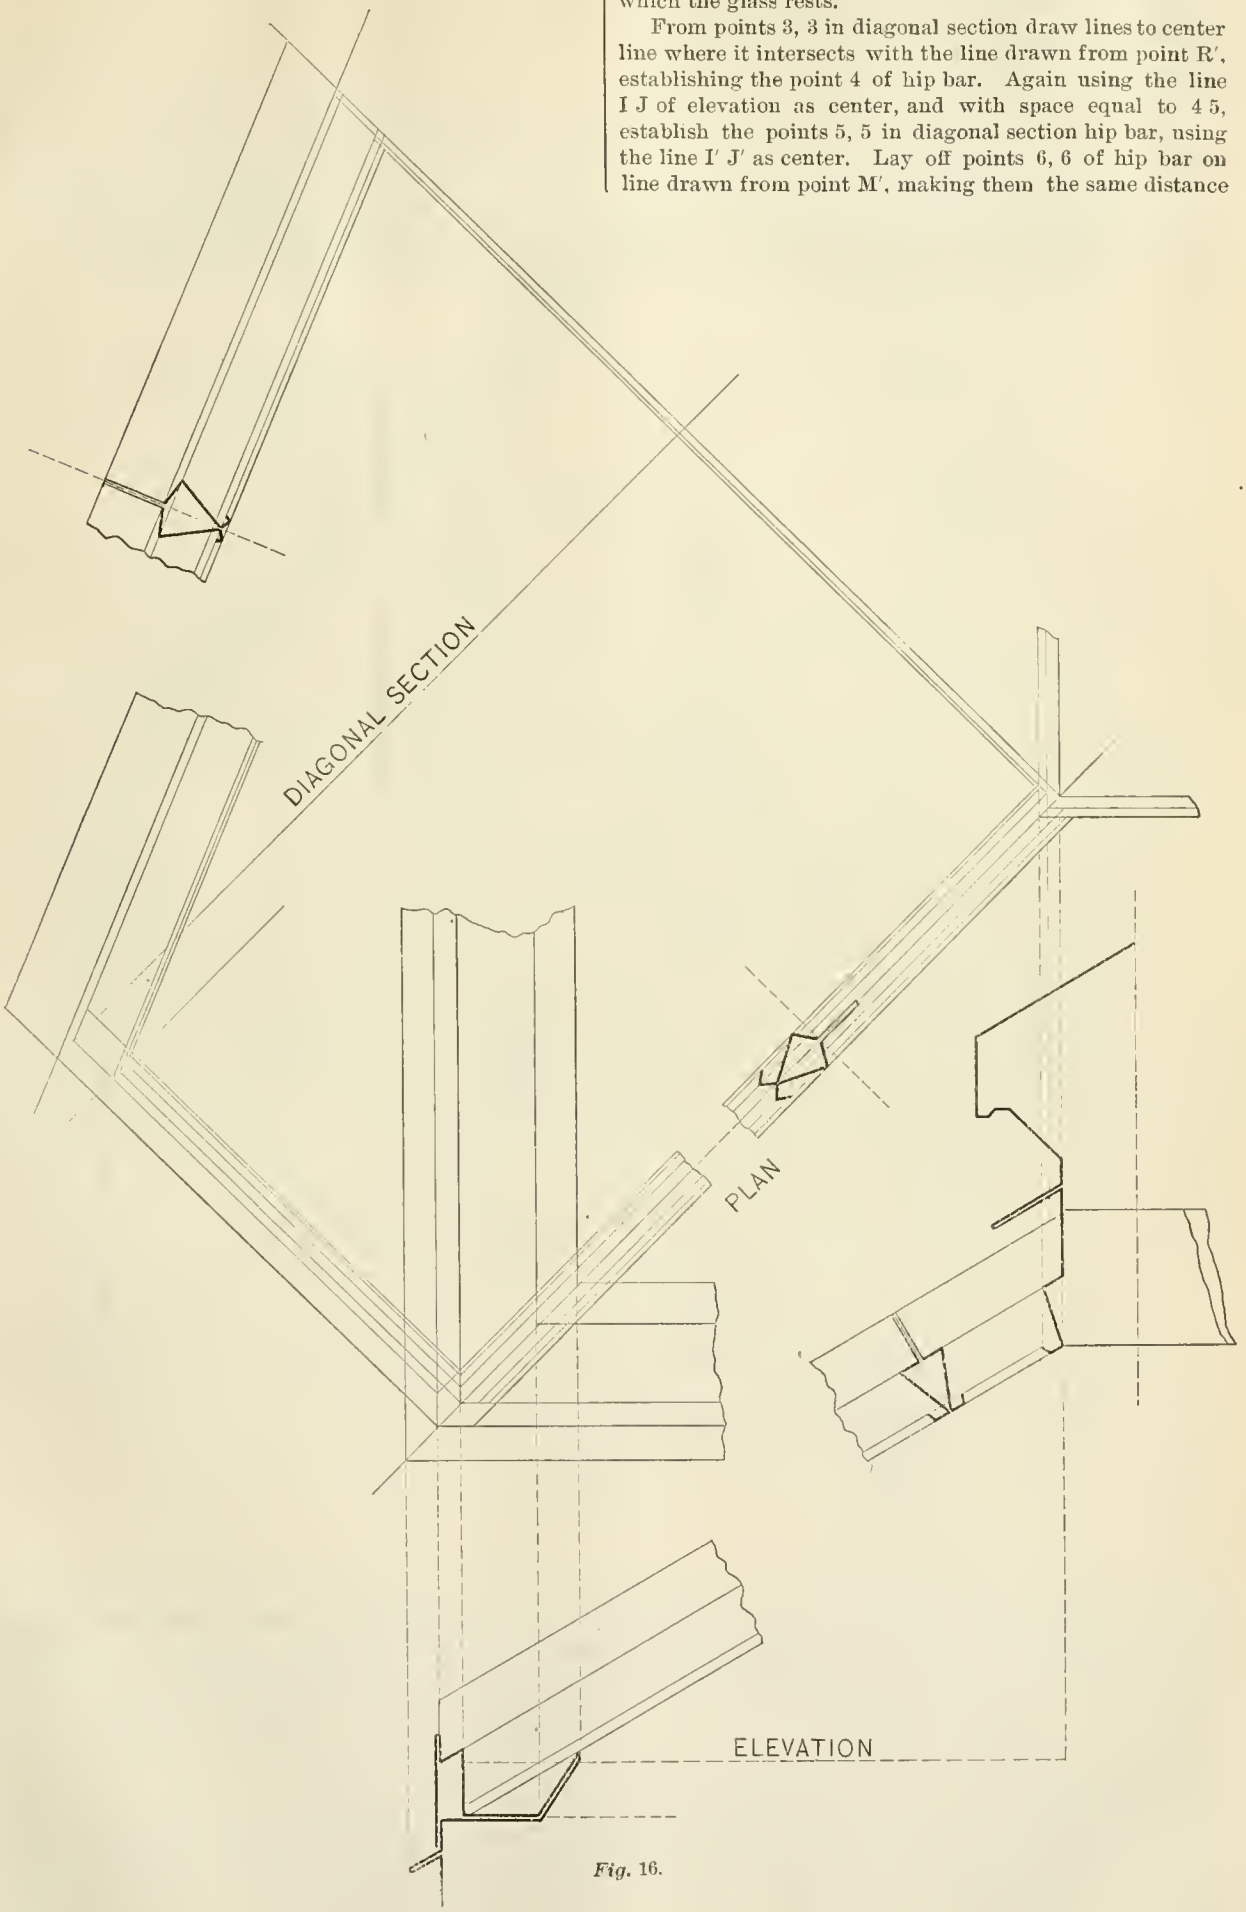

Fig. 16.

bar, which may be transferred to plan, as shown. At right angles to G H of plan drop dotted line from point O until it cuts the line drawn from point N' of diagonal section, establishing the point O'. Also, drop dotted line from point P of plan until it cuts the line drawn from point M', diagonal section, establishing point P'.

Drop lines at right angles to G H from points V, W in ventilator plan to lines drawn from points N', M', diagonal section, establishing the points V', W'.

As S, O, R, Q, P in curb plan and T, U, V, W in ventilator plan are the miter points of hip bar as they would appear in plan, and S', O', R', Q', P' of curb and T_2, V', T_1, U', W' in ventilator of diagonal section are the miter points of hip bar as they would appear in a diagonal elevation of hip, therefore the miter points of diagonal section are the correct intersections of hip bar with the curb and ventilator.

PATTERN FOR HIP BAR.

We are now ready to proceed with the laying out of the pattern for the hip bar.

In Fig. 18, exteuding center line I' J' indefinitely, as shown, at right angles to D' S', lay off stretchout of hip bar on I' J', as shown by 1, 2 2, 3 3, &c. Through these points draw lines parallel to D' S' indefinitely, as shown. Then lines dropped from X, S', O', R', Q', P' and T_3, T_2, V', T_1, U', W', at right angles to D' S', diagonal section, of Fig. 17, and as indicated by dotted lines of Fig. 18, to corresponding numbers of hip bar in the stretchont will, after tracing a line through the points so obtained in stretchout, be the necessary pattern for the hip bar. Referring to Fig. 1, we find we need four hip bars.

PATTERN FOR JACK BARS.

We now have all patterns necessary for the skylight except the pattern for the jack bars. Again taking elevation and plan, as shown in Fig. 19, at right angles to curb line 11 12 lay off the line B until it intersects with the center line of hip bar in plan, the distance from the miter line 11 12 of curb (or one corner of skylight) to line B in this case being the distance that M is from D in Fig. 10. Place the profile of the common bar on line B, as shown.

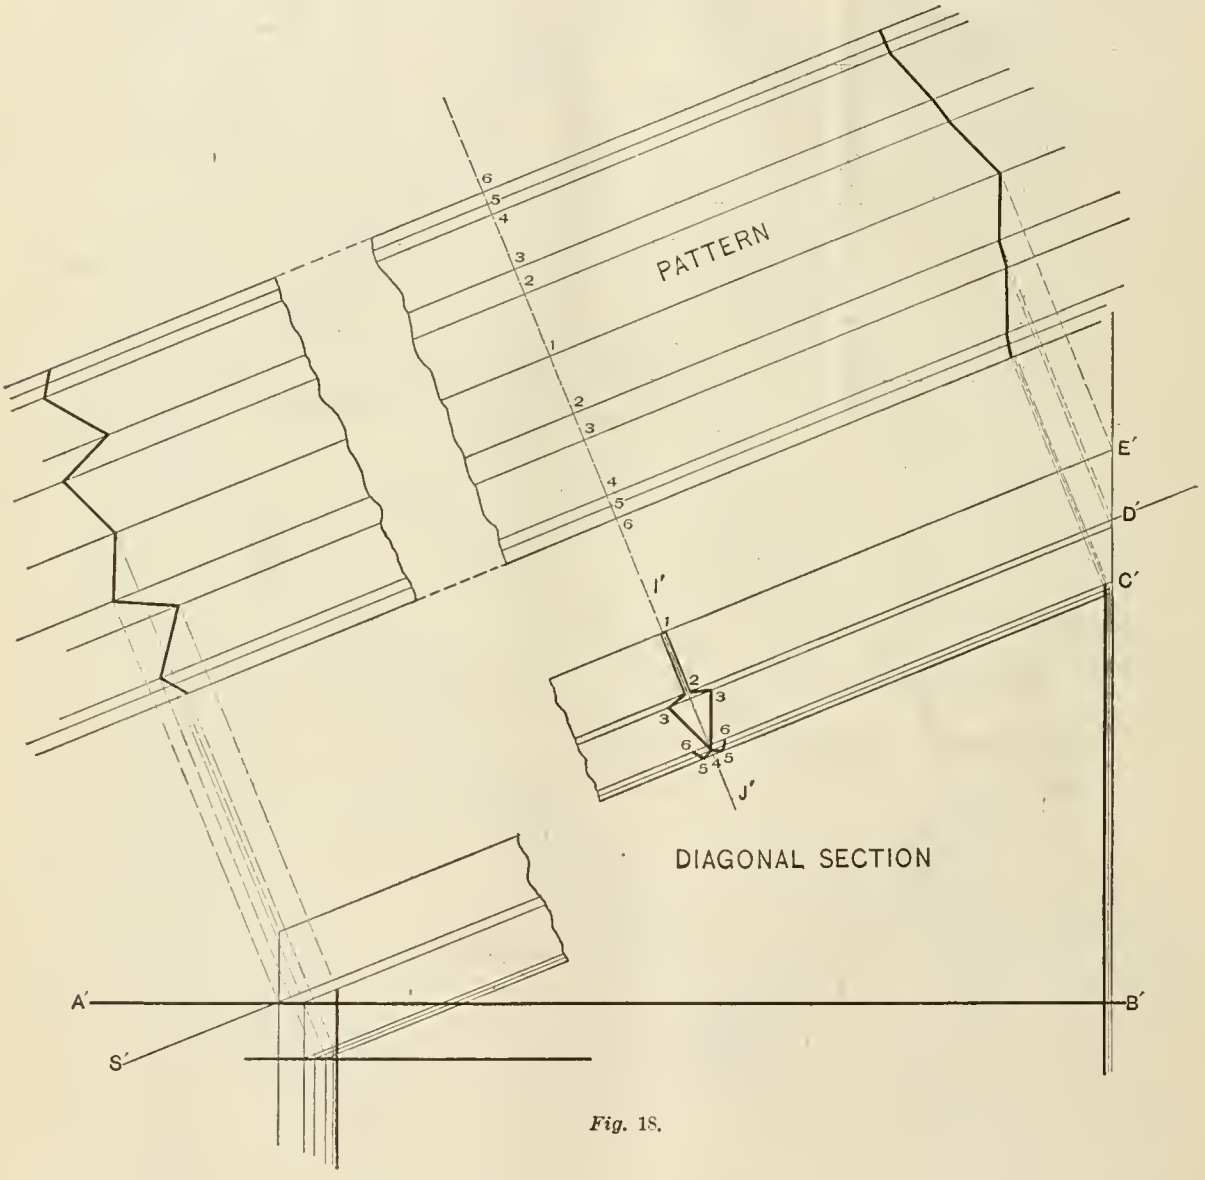

Fig. 18.

Parallel to line B drop lines through the varions points of profile of common bar until they intersect with corresponding lines of hip bar. From the points thus obtained and at right angles to liue B drop lines to corresponding lines of elevation bar—that is, line 1 of plan to intersect with line 1 of elevation, line 2 with line 2, &c., as indicated by dotted lines from plan to elevation. At right angles to elevation lay off stretchout 1, 2 2, 3 3, &c., as shown. Through these points and parallel to elevation bar draw lines indefinitely, as shown. Now from points obtained in elevation bar by lines dropped from plan and at right angles to elevation bar drop lines to corresponding lines in stretchout, as again indicated by dotted lines. Then a line traced through the points obtained in stretchout will be the desired pattern. It will be observed that the miter of the jack bar is the same

where it comes in contact with the curb as the miter of the common bars in Fig. 13. As the measuring line of the bars is on line 2, by referring to Fig. 10 (it being a quarter plan) we find we want four jack bars the length of each of the lines G I, J L, M O, and P R, 16 jack bars being required for the skylight in this case.

the right of the center line of pattern in Fig. 19 for the other side of bar.

I would suggest that laps be left on the various miters of the skylight wherever it is deemed advisable, for by so doing the maker may occasionally have an opportunity to put in a rivet and also do a much more secure job of

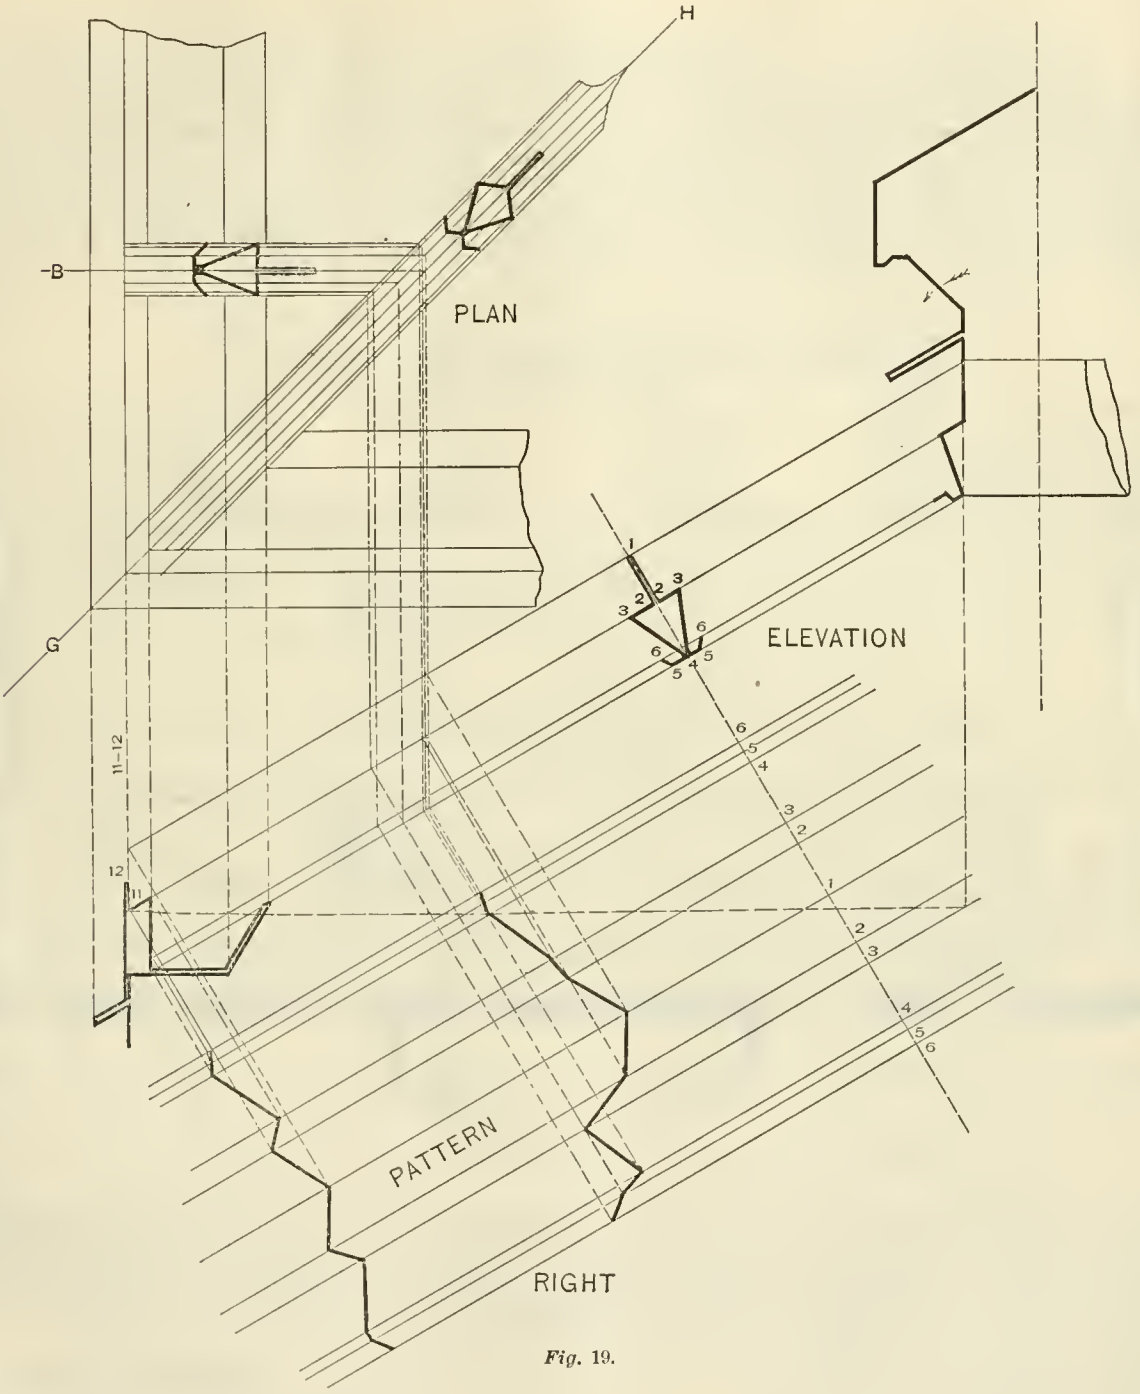

Fig. 19.

If it should so happen that a bar should intersect with the ventilator at the same point that the hip bar does, as at E, Fig. 10, one would simply have to use the half of pattern in Fig. 13 for one side of bar and the half of pattern to soldering. The bar profiles here submitted are, I think, the simplest kind in use, but it would be necessary to take the same steps as were pursued in this case to produce the patterns for any bar.

An Interesting Relic.

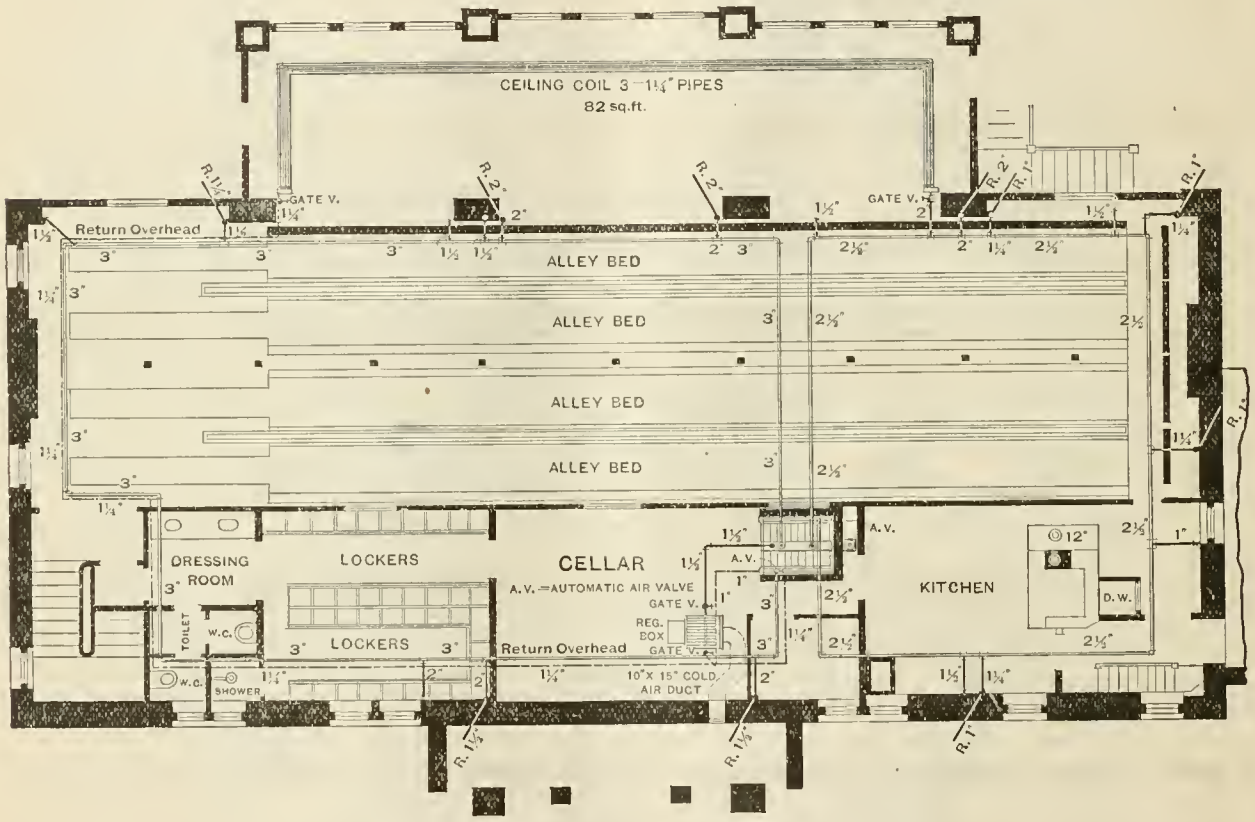
The attempt of some relic hunters to steal portions of an old boiler at Frederick, Md., has brought to light the claim of the owners and of Southern antiquarians that the boiler in question formed a part of the first boat actually propelled by steam. James Ramsey, a Maryland inventor, so runs the local statement, in 1785 conceived the idea of propelling a boat on water against the current. He devised and designed the machinery for applying steam power for this purpose, and had it forged at the old Cotoctin Furnace, near Frederick, owned and operated by Baker & Johnson. The boat was built at the Point of Rock, on the upper Potomac, and the machinery put in in the summer of 1785. The boat was worked up the Potomac to a place then called Bath, where General Washington was spending the summer. The experiment was successful, and General Washington certified that he had seen a boat actually propelled by steam at the rate of 4 or 5 miles an hour. The machinery was subsequently taken back to Cotoctin, and for two generations the boiler and the cylinder, the latter 4 inches in diameter, stood 3 feet above ground on one of the boundary marks of the Cotoctin property and Hayland, the extensive farm of William Johnson.

STEAM AND HOT WATER.

A Circuit System.

As a method of installing a steam heating plant the circuit system has grown in popularity, and as an example of such a system we show the plans, with the boiler and piping, of the club house of the Ridge Club, at Bay Ridge, Long Island. The plant was installed by W. F. Higgins & Co., 379 Lexington avenue, New York, using one of the new No. 327 Richmond sectional boilers with nine sections. The club house is situated on a slope of ground, so that the entrance to the porch and vestibule shown in Fig. 2 is from the ground level, and the floor of the basement shown in Fig. 1 is at the level of the ground at the back part. The back part of the club house faces New York Bay, and has a western exposure. The steam mains supplying the building are divided into two circuits. From the front of the boiler a 3-inch main runs to the back of the house and makes a circuit of one part of the building, and returning drops down and connects with the boiler at the right hand side at the bottom. Another main is 2½ inches in size, makes a circuit of the other part of the building, and returning connects at the bottom of the boiler on the left hand side, as shown in Fig. 1.

A third main, 1¼ inches in size, runs to an indirect radiator supplied with cold air from out of doors by means of a 10 x 15 inch air duct, and located beneath a 14 x 30 radiator in the main hall on the first floor, shown in Fig. 2. The return from this radiator is 1 inch in size, and connects at the bottom of the boiler. In the basement at the back of the building is an observation space overlooking the bowling alleys. This is heated by means of a ceiling coil composed of three 1¼-inch pipes, exposing about 80 feet of surface. A separate return is run from this coil to the boiler directly beneath the steam main, following it as it makes a circuit of the building. Risers are taken from the mains to the radiators on the first and second floors, located as shown in Figs. 2 and 3. In every case the branches or risers to the radiators are taken directly from the top of the main, as shown in Fig. 4. In running the steam mains after leaving the boiler, the pipes are so graded as to have a fall throughout the entire circuit back to the boiler, to return the condensation. Automatic air valves are placed at the boiler to relieve the circuit main of air that may accumulate. The circuit main in the basement is not covered, and serves as heating surface. Where a building is adapted for the use of the circuit system a considerable saving in pipe and labor is made, and there is little danger of trapping the pipes to interfere with satisfactory results. In this case, though the building is exposed to winds from the west after sweeping across the bay, there has been no difficulty in keeping the entire building at a comfortable temperature with the system in use.



A Circuit System.—Fig. 1.—Showing Basement, with Boiler and Piping.

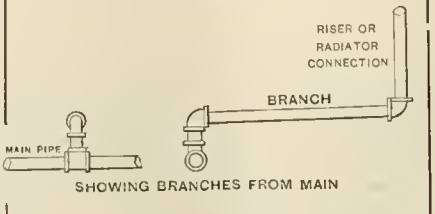


Fig. 4.—Showing Method of Connecting Branches.

HEATING NOTES.

D. F. Morgan has assumed the management of the Chicago branch of the D. F. Morgan Boiler Company, 23 and 25 West Lake street.

The monthly calendar for June distributed by M. Mahony, Troy, N.Y., is an attractive card, the central feature of which is a fishing scene. These are neat desk calendars, and will be welcomed by the trade.

The latest circulars received from the Richmond Stove Company, Norwich, Conn., are pamphlets of the Richmond steam and hot water heaters that have been issued in the interests of Davis, Wright & Co., Keene, N. H.; F. C. Weiant & Co., New Britain, Conn., and Henry Leitch, Hartford, Conn.

THE CARTON FURNACE COMPANY, Utica, N. Y., are about commencing additions to their plant to prepare for the manufacture of their line of Carton shipping room. They will also add to their foundry plant. Their first series of boilers, both steam and hot water, will be ready for the market by the middle of August, and we understand that they have already made several contracts in which these boilers will be used.

THE WILLIAMSPORT STEAM COMPANY of Williamsport, Pa., are now sending steam over all their lines except on Fourth street, from Hepburn street to Trinity Church. They cannot supply that section, as the steam pipes are under water which has not sufficiently receded.

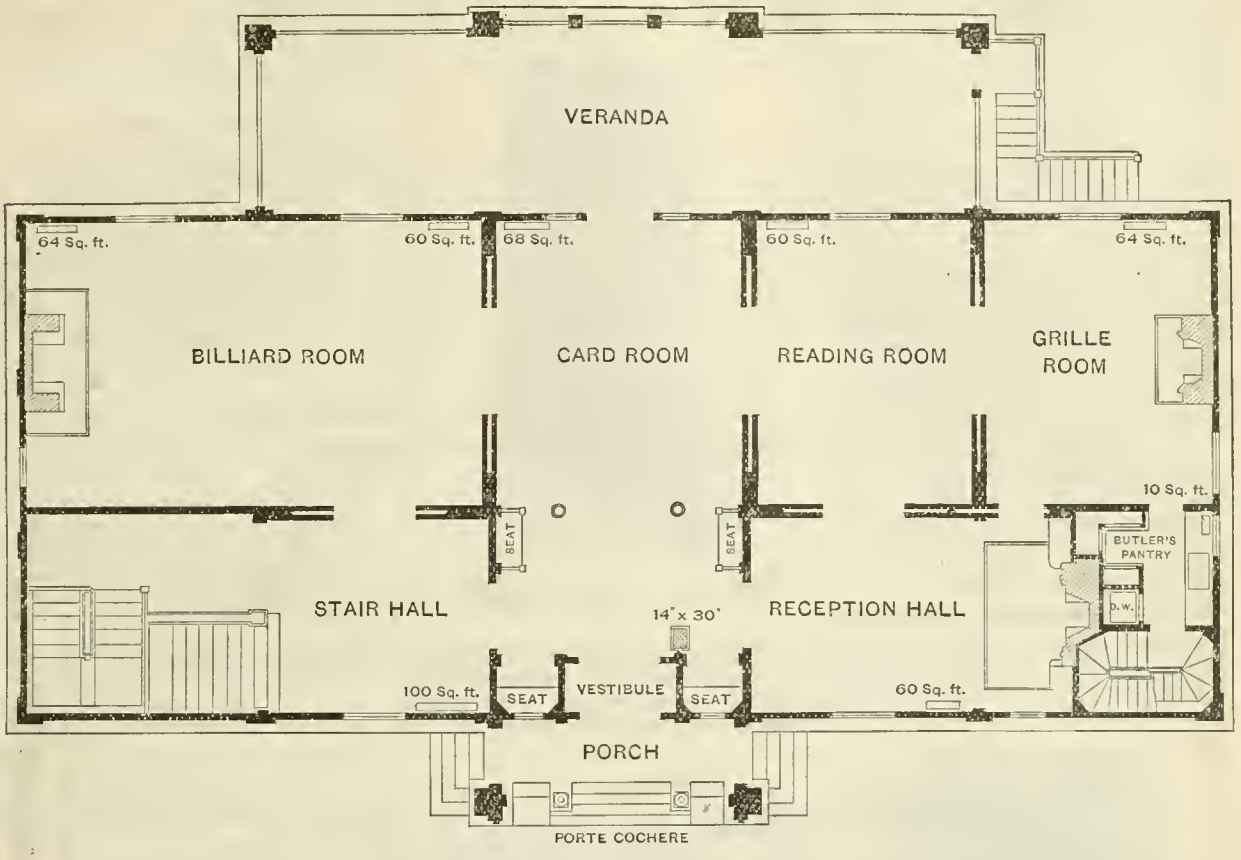

Fig. 2.—First Floor.

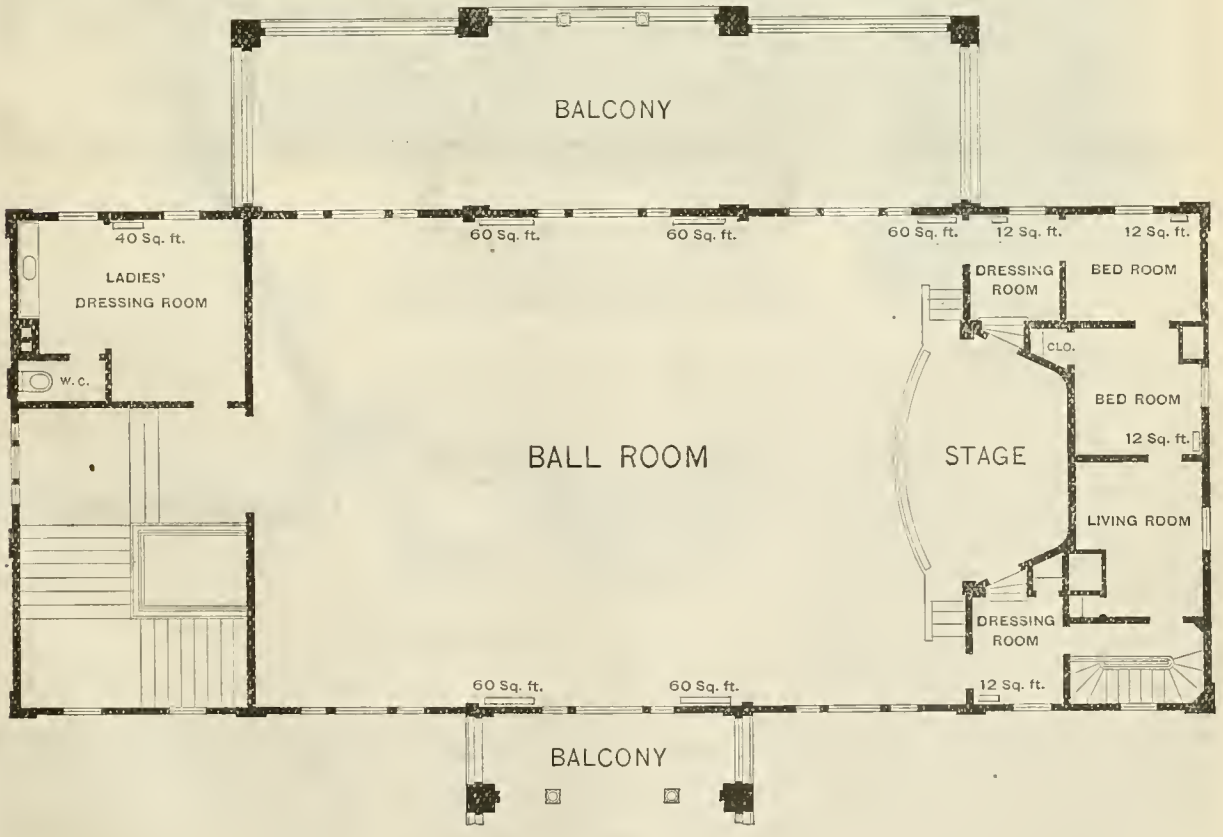

Fig. 3.—Second Floor.

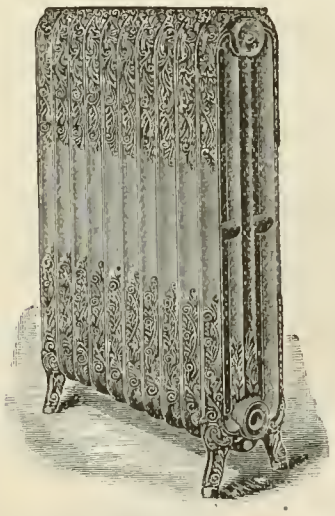
The A. A. Griffino Iron Company are now comfortably established in their new quarters at 34 Dearborn street, Chicago. Manager Frank W. Somers has fitted up the offices and wareroom very tastefully. They are located on the ground floor, as at the previous location, but enjoy an advantage in sole occupancy. Samples are shown of a considerable number of the leading styles of Bundy radiators, handsomely painted and decorated. A portion of the space is occupied by specimens of the Gurney steam and hot water heaters, for which Mr. Somers is also Western agent.

The American Radiator Company, 111 and 113 Lake street, Chicago, have issued a very fine hanger, showing no less than 46 patterns of steam and hot water radiators which they manufacture at their Detroit and Buffalo factories. They embrace a very great variety of kinds and styles, shapes and sizes. Two colors are used in printing the hanger, which is exceedingly tasteful and ornamental. It will be found very useful by steam and hot water fitters in making selections of radiators.

"New" Standard Radiators.

The accompanying illustrations show general views of two radiators lately brought out by the Standard Radiator



"New" Standard Radiators.—Fig. 1.—Regular Pattern.

Company, Buffalo, N. Y. Fig. 1 illustrates the "New" Standard radiator of regular loop. The appearance is indicated in the engraving, the radiator being a handsome article of neat and graceful form and pleasing decoration. These radiators are built in various sizes from 2 to 32 sections, and in six hights, from 18 to 44 inches high. The 32-inch loop of two sections has 9 square feet. Each section is 9 inches over all and hight from center of opening to floor is 5 inches. The manufacturers also furnish special hight leg sections, and tappings ranging from 4 to 10 inches from center of opening to floor, as required. These radiators are made for both steam and hot water.

Fig. 2 is a perspective view of the "New" Standard radiator single loop, which are made in sizes from 2 to 32 sections, six hights from 18 to 44 inches, the surface of two-section radiator of 32 inches hight being 5 square feet. Each section is 5½ inches over all, and hight from center of opening to floor is 5 inches. As in the case of the regular pattern, special hight leg sections can be furnished if desired. The manufacturers particularly point out that these radiators have top and bottom connection, which they say insures rapid and

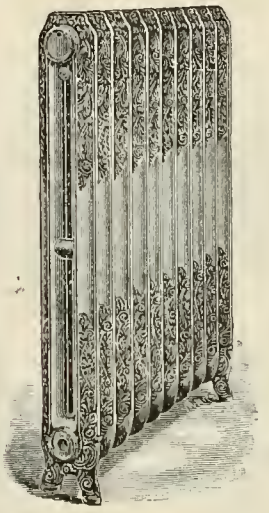


Fig. 2.—Single Loop.

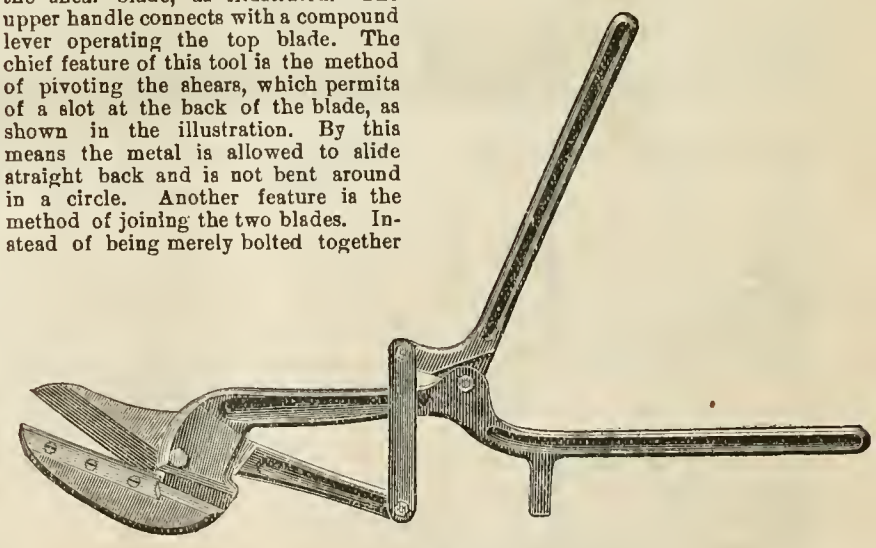
positive circulation. They mention that they have decided to make all their radiators in this way, as they are firmly convinced of its superiority.

The Lobl Sheet Metal Shears.

We show in the accompanying illustration a general view of the Lobl sheet metal shears, manufactured by Eugene Kulinski & Co., 91–93 Thompson street, New York. Referring to the illustration, it will be seen that the lower shear is a single piece, to which is attached the shear blade, as illustrated. The upper handle connects with a compound lever operating the top blade. The chief feature of this tool is the method of pivoting the shears, which permits of a slot at the back of the blade, as shown in the illustration. By this means the metal is allowed to slide straight back and is not bent around in a circle. Another feature is the method of joining the two blades. Instead of being merely bolted together



The Lobl Sheet Metal Shears.

the main joint runs in a turned socket, which, it is pointed out, takes the strain off the screw. The compound lever, of course, gives great power to the shears. The shears are made of cast steel, the jaws being of hardened Carpenter & Jessop steel, and it is mentioned are easily replaced. The upper jaw is rounded so as to reduce the cutting point to a minimum. The No. 3 shears are 36 inches long with 6½-inch jaws, weigh 20 pounds, and will cut metal as heavy as No. 10 brass and No. 12 iron.

Australian Tin.

Australia, as is well known, is one of the tin bearing countries, from which supplies of the metal find their way to the United States. The principal stanniferous deposits of that country are found in the colony of New South Wales, where they were discovered as far back as 1853. It was not, however, until 1872 that they began to be systematically worked. From recent statistics of the mineral production of New South Wales, furnished by the Colonial Department of Mines, the quantity of tin raised and exported during the 21 years ending December 31, 1892, was 121,912 tons, valued at $31,236,368. This includes tin in the shape both of ore and of ingots. The *Iron and Steel Trades Journal* of London observes that the production of the metal is now one of the settled industries of the country, and, as the supply is practically unlimited, the quantity raised depends almost entirely upon the price realized. There are no tin manufacturers in New South Wales, and although the mineral is so plentiful in the colony, the whole of the manufactured tin used for canning meat and fruit and other purposes has to be imported. The quantity of tin plates so imported during 1892 amounted to 62,078 packages, of the estimated value of $237,875. There were also 19,033 packages of tinware, valued at $80,613. Practically the supply of tin in the colony is inexhaustible. Up to the present time the deep deposits and lodes have scarcely been touched, the bulk of the metal obtained being in the form of stream tin.

The latest addition to the American Line's transatlantic fleet is the "Kensington," which made a most successful trial trip on the Clyde last week. The vessel was built by J. & G. Thompson of Clydebank, Scotland, the builders of the "New York" and "Paris." She is 480 feet long, 57 feet beam and 40 feet deep, with gross tonnage of 10,500 tons, and a measured cargo capacity of 11,500 tons. The "Kensington" is fitted with quadruple expansion engines of 8000 horse-power, and is expected to attain a working speed of 15 knots per hour. While primarily a cargo and steerage steamship she will have accommodations for 200 cabin passengers.

PLUMBING and GAS FITTING.

William C. Macdonald.

The plumbing trade will learn with regret of the death of William C. Macdonald, who was drowned in the Passaic River, near Nutley, N. J., while heroically endeavoring to save the life of a young lady who had fallen from his naphtha launch, "The Martha," last Saturday afternoon. Mr. Macdonald was a member of the plumbing firm of Macdonald & Co., 296 Sixth avenue, New York, being associated with Alexander Bryant and W. J. Crow. Mr. Macdonald is a son of the late Joseph A. Macdonald, who organized the firm in 1861, and who was well known to the plumbing trade, having been identified with the great progress which it has made during the past ten years, serving as president of the New York Association of Master Plumbers as well as president of the National Association of Master Plumbers. The young man was 22 years of age, and his death was a severe blow to his mother and two brothers, who live at the Chelsea apartment house in New York.

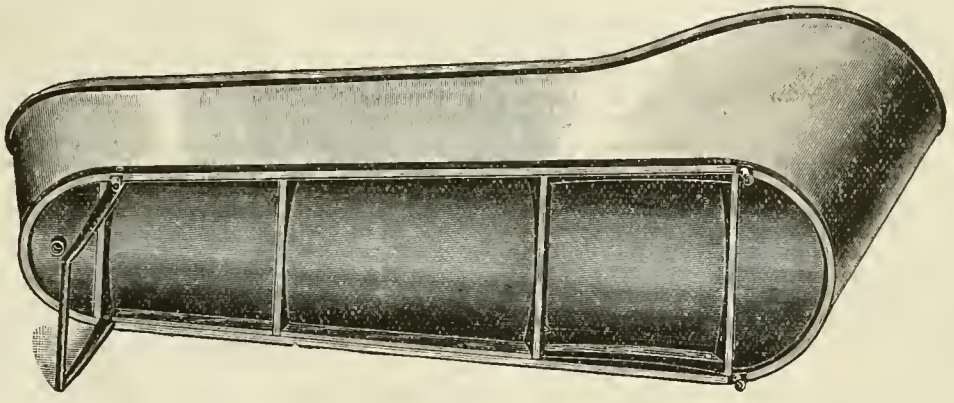
A Worthy Plumber.

The following letter to a Bridgeport, Conn., daily paper from Daniel G. Finnerty, president of the National Association of Master Plumbers, expresses the opinion held by all of Mr. Goodsell's friends:

I notice in your issue of May 21 the New York *Tribune* sneers at the proposition of elevating a common plumber to the high station of Governor of your State. I should like very much for the New York *Tribune* to send one of its representatives to one of the Master Plumbers' State or National conventions that he might see and learn that the plumbers of the United States compare favorably with any class of business men, both in ability and integrity, for the welfare of the citizens and public at large. There can be found men among the plumbers who are competent and capable, not only to fulfill the high position of Governor, but also any office in the gift of the people, and Zalmon Goodsell is one of those men, and whom I have had the pleasure of knowing for a number of years, and the citizens of Connecticut would be the gainers by electing a thorough business man to the very important position of Governor. Therefore let your citizens nominate and elect Zalmon Goodsell Governor of your State and the citizens will have a man who will administer its affairs with both intelligence and honesty and in a business-like manner, and that is what is wanted by all good citizens. Hundreds of business friends of Mr. Goodsell throughout the country know full well that if elected Governor the people of Connecticut will never regret that they cast their votes for the Bridgeport master plumber.

Economy Bathing Tub.

The accompanying illustration shows a general view of the Economy bathing tub, manufactured by Forest Druken brod, New Berlin, Ohio. It is a portable bathtub, made of zinc, with top and bottom rims of well seasoned bent hardwood. The advantages of this form of bathtub are alluded to by the manufacturer. The tub can be transported wherever it is desired to have it, and when not in use can be hung against the wall or placed in a vacant corner or closet. It has plug and chain attachment, the waste being at the lower end, as shown in the illustration. The bottom is concave or rounding, so that it does away with the necessity of much water and at the same time fits the body. The tub can be elevated at the foot end so as to raise the level of the water and completely cover the body. It is painted on the outside and enameled within.



Economy Bathing Tub.

A NOVEL METHOD of bringing an apparatus that is very essential in high buildings in the large cities to the notice of the public is adopted by the National Meter Company, 287 Broadway, New York. An attractively painted open wagon bearing their name and address, with the words, "Water Meters and Gas Engines," is being driven around the city, stopping occasionally at different points on the streets, which shows a Nash pump operated by a gas engine adapted for the use of gasoline. The pump is connected with a tank about 3½ feet in diameter and the same hight, and in operation a steady stream of water is continually thrown into the tank by the pump. The tank bears the lettering: "Capacity, 750 gallons per hour to a hight of 50 feet."

Trade School Exhibits at the Pratt Institute.

The annual exhibition of the work of the students during the academical year 1893–94 was held at the Pratt Institute, Brooklyn, on May 31 and June 1 and 2. Among the most interesting exhibits were those of the Trade School classes of the institute, which included plumbing, carpentry, house, sign and fresco painting and machine work. Each department made a remarkably creditable showing, and none more so than the plumbing class. The work of the pupils of the class—about 50 in number—was displayed in their own class room. Specimens of the handiwork of each student being attached to the wall opposite his particular bench. On one side of a large show board in the center of the room was a complete system of piping for a kitchen boiler connection and lavatory. The other side displayed a fine collection of fancy plumbing work, all being the work of the pupils. In addition, two handsome panel specimens, the work of the 1892–93 class, were on exhibition. These panels formed part of the Pratt Institute educational exhibit at the World's Fair.

The examples of the skill and efficiency of the pupils of the plumbing class drew for the same hearty words of commendation from the visiting plumbers who viewed them. They reflect great credit on Instructors Todd and Heath, under whose management and care the necessary knowledge has been imparted. A marked feature of the present year's exhibition was the lively interest shown in it by the various trade associations. Large delegations of artisans attended and carefully inspected the work on view.

Already many applications have been received from young tradesmen desirous of joining next season's plumbing class, and it is expected that, as usual, the candidates for instruction will far exceed the accommodation. The managers of the Trade School take a pardonable pride in the unqualified success of the institution, which is progressing annually to greater importance and usefulness.

Missouri Master Plumbers.

The following was sent by State President L. B. Cross, 1212 Main street, Kansas City, Mo., under date of June 1 to the plumbers of Missouri:

The Missouri State Association of Master Plumbers will meet in St. Louis on Friday, June 15, at 10.30 a.m., at the hall of the St. Louis Master Plumbers' Association, Hagan Building, S. E. corner Tenth and Pine streets. The object of the meeting is the election of delegates to the National Convention in Detroit, on June 19, and for the transaction of such other business as may come before the meeting. We congratulate our brother plumbers on the good spirit and unanimity shown since the organization of the State Association in Kansas City last December, and we hope to see every city and town in our State represented at this meeting. Delegates on arriving will please immediately report themselves at the headquarters, Lindell Hotel, Sixth street and Washington avenue, where the Reception Committee will be in continual session o tender them a cordial and hearty welcome.

TRAPS AND VENTS.

A. S. Chipman of the firm of A. S. Chipman & Co., manufacturers' agents and dealers in plumbers' supplies at 69 Pearl street, Boston, was married to Miss Nellie Jubell of Winooski, Vt., on Wednesday evening, May 31. After a tour the couple will settle down in Wellington, Mass.

John Shine, plumber, has moved his material from Elm street to the building in the rear of the Trenton National Bank, Trenton, Mo.

G. A. Stanfield, who for the past two and one-half years has been in the employ of the Marietta Plumbing Company, Marietta, Ohio, has established himself in the plumbing and gas fitting business at 411 Second street.

George M. O'Connor, 156 Fulton avenue, Long Island City, N. Y., has just started in the plumbing business.

Robert Handyside has purchased the plumbing business formerly conducted by A. Handyside at 120 Worthington street, Springfield, Mass.

T. C. Waters, who has been in the plumbing business at Shenandoah, Pa., for the last 22 years, has opened a store at Pleasantville, Pa., or Eureka post office, as it is called, where he will carry on plumbing, tinsmithing and also carry a full line of stoves, heaters, &c.

Isaac H. Voorhis has succeeded his brother, the late Garret D. Voorhis, in the stove and plumbing business, at 11 Fair street, Paterson, N. J.

A Washington (D. C.) plumber has been brought before a justice for violating the plumbing regulations, having pursued his occupation without a license.

W. E. Everitt, 336 Hamburg street, Buffalo, N. Y., is using in the city of Buffalo a machine for boring holes through the earth under street pavements for tapping water and gas mains without disturbing the pavement. The local plumbers, it is reported, have witnessed its operation and are pleased with the result.

Some of the plumbers of Omaha, Neb., were recently brought before the Board of Public Works and admonished that if they did not cease to transgress the rules of the Board their licenses would be revoked. Some of the plumbers in the city have chosen to run the risk of doing business without a license, and when their work required a permit this portion of it was sublet to a licensed plumber. The board has decided that such practice is illegal and has served notice that the next time a licensed plumber is found doing such work his license would be revoked.

The City Council of Pueblo, Col., have revised one of the clauses of their plumbing ordinances as follows: "No person shall carry on or contract the business of plumbing or drain laying or engage in the business of plumbing or house drainage or connect house drains with city sewerage until he or they shall have first obtained a license from the city clerk; provided, no license shall be granted any applicant or applicants until he or they shall first have given the plumbing inspector, city engineer or Sewer Committee satisfactory oral or documentary evidence of their ability as a practical plumber or plumbers or drain layers, and they shall have a regularly established plumbing business and place of business in the city. They shall have a properly executed bond in the sum of $1000, and pay an annual license fee of $10."

The Davis Creswell Mfg. Company of Denver, Col., met with a serious loss on the 28th ult. in the almost complete destruction by fire of their foundry and machine shop, used in the manufacture of plumbers' and steam fitters' supplies.

H. E. McKechney, formerly of Rochester, N. Y., has opened a plumbing shop in the Waverly Block, Newark, N. Y., as his headquarters for plumbing, steam and hot water heating.

The Smith & Anthony Company of Boston, New York and Chicago have issued a circular announcing that on June 1, 1894, they transferred the plumbing specialty business carried on in their name at 217 Lake street, Chicago, to the Alberene Stone Company, who will act as Western agents for the Sanitas plumbing appliances. They state that the wide acquaintance and popularity of the Alberene Stone Company are guarantees that their patrons will receive prompt and satisfactory service in all future dealings. J. A. Cunningham, Jr., who has been their Western manager for the past four years, becomes associated with the Alberene Stone Company in a responsible capacity, and with the added facilities at his disposal will be able to represent the Sanitas specialties more acceptably to the trade than ever before. The Alberene Stone Company notify the trade that, having assumed the agency in Chicago for the sale of the plumbing specialties manufactured by the Sanitas Mfg. Company, they have removed their office and warerooms to 217 Lake street, where they will continue to sell their Alberene stone specialties in connection with the Sanitas appliances. C. C. Todd retains the management.

The monthly report of the Building Inspector of Cincinnati, Ohio, will show that during the last month 163 plumbing permits were issued. This is the largest number in the history of the office for that period.

James Gray, plumber and manufacturer of plumbers' specialties, East Albany, N. Y., took a steamer this week for a trip abroad. He will visit England, Ireland and Scotland and will make a short trip on the Continent.

The Chicago Plumbers' Arrangements.

The Chicago Master Plumbers are arranging for a pleasant excursion to Detroit on the occasion of the approaching national convention. They have issued the following circular:

Chicago, Ill., June 5, 1894.

To Delegates and Members of the Master Plumbers' Association who will attend the Twelfth Annual National Convention, to be held at Detroit, Mich., June 19–21, 1894:

The Chicago Master Plumbers' delegates, alternates and members have arranged their transportation to Detroit and return via the Wabash Railroad. A special train has been chartered and will leave Chicago at 10 a.m., June 18, from depot, Dearborn station, and arrive at Detroit not later than 5 30 p.m. Train will consist of the following first-class vestibuled equipment: Baggage car, with commissary, ladies' coach and Wagner palace sleeping cars and private dining car, which will be stocked with the choicest delicacies of the season. The cost of the railroad ticket in the Central Traffic Association will be one and one-third fare for the round trip—namely, when purchasing your ticket request certificate of railroad agents, which certificate, when signed by the secretary of the Master Plumbers' National Association, at Detroit, will entitle you to return to starting point in the Central Traffic Association at one-third the regular one way rate. The fare from Chicago to Detroit, one way, is $7.75.

The round trip on this plan will be $10.35. Dinner in dining car will be only $1. The committee have chartered the very best Wagner sleeping cars in special service, direct from the Wagner Sleeping Car Company. Seats in the sleepers can be had on the train at a minimum of expense. The Committee of Arrangements have carefully considered the question of comfort and economy, and trust their efforts, which have been directed toward the immediate benefit of the members, will be appreciated.

An invitation is hereby extended to all delegates, alternates, members and their families, who can arrange conveniently to come via Chicago, to join our special train party. The trip will be a delightful one. Up to the present time the Western Passenger Association have failed to give reduced rates in their territory. We are hopeful, however, of securing some reduction for any who may apply to us, from points tributary to Chicago. The committee would like to hear from all who have in contemplation the trip to Detroit, so that ample accommodations can be provided and unnecessary crowding of special train be avoided. Tickets and certificates can be had on application to undersigned,

or ticket offices of Wabash Railroad, 201 Clark street, Chicago, at depot office and also on the special train.

PAUL REDIESKE, President.
ALEX. M. MURRAY, Secretary.

J. G. ROLAND, Ch.,
P. M. MURPHY,
T. P. CULLOTON,
P. SANDERS,
} Transportation Committee.

HEATING ⁂ PLUMBING.

NEW WORK AND CONTRACTS.

HUNT & CONNELL COMPANY, Scranton, Pa., have contract for placing a No. 310 Low Down steam and air combination in the residence of Geo. Hughes of Luzerne, Pa. The same firm also have contract for placing a No. 218 Economy steam boiler in the building owned by James Hughes of Luzerne, Pa.

DAVID HORN, of York, Pa., has contract for installing one Economy combination steam and air heater in the residence of David Strickler of that town.

THE CONTRACT for the heating apparatus for the new Industrial School at Newport, R. I., has been awarded to Philip F. Conroy.

AT THE LAST MEETING of the Executive Committee of the Board of Trustees of the Winthrop Normal and Industrial College, Rock Hill, S. C., the following contracts were given out: For heating apparatus to main building and one dormitory, to Hunnicutt & Bellingrath, Atlanta, Ga., plant to cost $10,000; for slate roof for main building, one dormitory, kitchen and heating plant, to Jones & Co., Atlanta, Ga., price $6300.

THE S. WILKS MFG. COMPANY, 113 to 123 Clinton street, Chicago, are to furnish a large heater for the residence of Mr. Cleveland, Englewood; a large heater and tank for the apartment building of H. Konoke, Dunning and Sheffield streets; Wilks heater and radiator for heating and supplying hot water for the depot of Swift & Co., Port Huron, Mich.; heater for greenhouse at Stillwell, Mich. The company have also received orders for their heaters from Macon, Mo., Romeo, Mich., and other points.

EVERY ONE RECOGNIZES the supreme importance of first-class plumbing, says a writer in one of the Boston dailies, speaking of their recently completed $3,000,000 court house. The plumbing work in this building was installed bp George A. Wilson of 73 Esaex street. The fixtures include 215 water closets, 75 lavatories and 60 urinals. The latest and most improved materials were used throughout in fitting it up. The hot and cold water pipes are of extra heavy brass. This plumbing contract was one of the largest ever given in New England. The heating of the building was designed by Bartlett, Hayward & Co., Baltimore, and the contract, which amounted to $125,000, was awarded to Samuel I. Pope & Co. of Chicago. The work of installation was supervised by J. E. Lynch, now of the firm of Lynch & Woodward, of 26 Beech street, Boston.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until June 29, for work including the plumbing for the United States Post Office, Custom House, &c., Building at Jacksonville, Fla.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until June 30, for a low pressure return steam heating and ventilating apparatus for the United States Court House and Post Office Building at Tallahassee, Fla.

THE BOARD OF SUPERVISORS of Schuyler County, N. Y., met at Watkins last Saturday to award the contracts for the repairs to the county buildings. The contract for the steam heating and plumbing was awarded to R. H. Walker of Elmira, N. Y., for $2857.

HIGGINS & Co, 379 Lexington avenue, New York, have the contract for heating a four-story stone dwelling at 310 West Eighty-ninth street, using a No. 124 Richmond hot water heater; also a hotel, 270 Bowery, owned by Gary & Lowless, using a No. 313 Richmond hot water heater.

JAMES A. TRANE, La Crosse, Wis., has been awarded the contract for furnishing the heating apparatus for the new addition to the Logan Street School.

THE SCHOOL BOARD OF INDIANAPOLIS, IND., have passed an appropriation of $1800 for the repairs to the heating boilers and construction of new flues in School No. 2.

AMONG THE CONTRACTS taken recently for steam heating by Cook & Chick, 253 and 255 Kinzie street, Chicago, can be mentioned the following: Store and apartment building of Hynes Bros., 3641 and 3643 State street, and the store and apartment building of Lewis Bates, 3637 and 3639 same street.

MRS. A. J. NYE is having placed in her frame dwelling a No. 418 Richmond steam heater, by C. B. Jackman & Son, Nashua, N. H., who are also installing Richmond hot water heaters in the residences of George B. and D. J. Cone.

THE THEO. JACOBS COMPANY, 72 and 74 Market street, Chicago, have secured the contract for steam heating in the Marquette Building, Dearborn and Adams streets. There will be 50,000 feet of the American Radiator Company's radiators used in the building.

KEHM & MERTZ, 289 East Kinzie street, Chicago, are to install a steam heating plant in the residence of C. E. Kohle, 2826 Michigan avenue.

THE WELLS & NEWTON COMPANY, 274 Dearborn street, Chicago, are to install a steam heating plant in the Wellington Apartment Building, Thirty-fifth street and Wabash avenue.

THE KELLY & JONES COMPANY, 48 to 52 North Clinton street, Chicago, have the contract for steam heating in the Winston Apartment Building, East Superior street.

MARVIN & DEBOOY of Orange City, Iowa, are using a No. 121 Richmond hot water heater to heat the dwelling owned by Charles Lewis of that city.

THE WALCOTT-HURLBUT COMPANY, 175 and 177 Lake street, Chicago are to furnish two Siphon Eduction closet ranges of seven sections each for the Crain Street School at Evanston, Ill.

THE WELLS & NEWTON COMPANY, 274 Dearborn street, Chicago, have the contracts for plumbing in the Marquette Building, Adams and Dearborn streets; residence of C. E. Johnston, 4442 Forestville avenue, and are to overhaul the plumbing in the residence of C. E. Kohle, 2826 Michigan avenue.

RICHMOND STEAM AND HOT WATER HEATERS are being used in heating contracts secured by J. H. Cogan & Co., Augusta, Maine, for the residence of the Hon. Benj. F. Parrot. At Boston Isaac Coffin & Co. are using them in the residences of C. A. Pierce, C. W. Mason and N. E. Chase. At Lowell, Mass., the H. R. Barker Mfg. Company are using one in the residence of Willard A. Brown, and F. A. Bates has the contract to use one in the Lyceum Building, at Braintree, Mass.

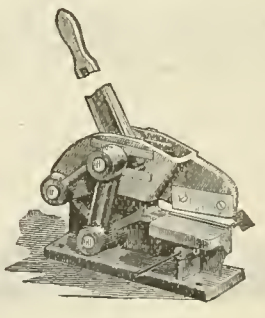
BIDS will be received up to June 24 for furnishing hot air furnace to heat the school building at Milford, Ohio. The bids should be addressed to Dr. Con. Gatch and should be inclosed in an envelope marked "Bids for furnace."

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until July 6, for steam heating and ventilating apparatus for the United States Post Office Building, Fort Dodge, Iowa Drawings and specifications may be obtained at the office of the superintendent at Fort Dodge, or from the Supervising Architect at Washington.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until July 3, for the hot water heating and ventilating apparatus for the United States Post Office Building, Lowell, Mass. Drawings and specifications may be obtained at the office of the superintendent at Lowell or from the Supervising Architect at Washington.

Core Rod Cutter and Shear.

The engraving represents a tool designed by the S. Obermayer Company of Cincinnati, Ohio, for the foundry core room or where a miscellaneous amount of cutting off and light shearing is done. It will cut round iron up to ⅝ inch in diameter, and with the gauge attached, which can be set to any



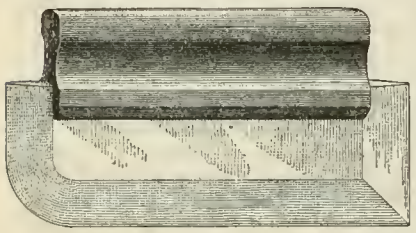
Core Rod Cutter and Shear.

length up to 15 inches, rapid work is possible. The shears are of tool steel 4 inches in length and can be readily removed for sharpening. The handle is of malleable iron 15 inches long. By reference to the engraving it will be seen that the rear ends of the two jaws are pivoted together, the upper jaw being slotted to admit the other. The two jaws are also connected by links whose lower ends are pivoted to the lower jaw and whose upper ends are provided with studs entering guides formed in the upper jaw, as shown. This arrangement gives great lever power and permits of the cutting of large pieces, considering the size of the machine, which weighs but 35 pounds.

THE RETAIL STORE.

The Boosinger Scraper.

Harris E. Thomas, Lansing, Mich., is offering the scraper herewith shown. It consists of a heavy piece of rubber 4½ inches long and 1¾ inches wide, with beveled edges, set in a wooden handle. The device is particularly adapted to scraping off dining room dishes of all shapes. The point is made that with the scraper this is done much quicker and neater



The Boosinger Scraper.

than with a knife, and that all danger of marring or scratching the finest of china or silver is obviated. It is explained that the rubber blade being thick, with beveled edges, it will not roll under, but clings to the dish, and so effectually cleans even one of irregular surface that little more than a thorough rinsing in water is required to make it perfectly clean. The scraper may be used for drying windows or other smooth surfaces; also for cleaning fry pans, kettles, pudding dishes, basins, &c., preparatory to washing them.

Ladder Skate.

Specialty Mfg. Company, Titusville, Pa., are offering a ladder skate, as here shown. The bottom of the skate is

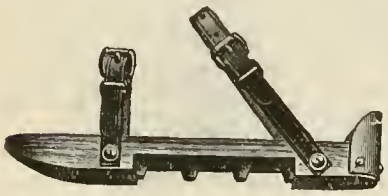


Fig. 1.—Ladder Skate.

provided with a three-loop casting to prevent slipping on the round of a ladder. The manufacturers state that the skates can be put on or taken off in an instant; that they do not have to be

Fig. 2.—Bottom of Ladder Skate.

taken off when walking on the ground; that by their use standing on the round of a ladder is made as comfortable as standing on the ground, and that the skates are so made that the foot can be moved on a ladder to any desired position. The skates are designed for the use of tinners, painters, fruit growers and others who use ladders. The point is made that the skates are great savers of shoes.

Double Tank Thermometer Churn.

R. M. Ball, Muncie, Ind., is offering the double tank churn shown in the accompanying illustrations. The churn consists of a vertical dasher with a rotary reciprocating motion and two detachable cylindrical tanks, one of

Fig. 1.—Double Tank Thermometer Churn.

heavy cross tin inserted inside of and resting with its upper rim or flange upon the wooden tank, the inner one of which forms the cream containing vessel, as shown in Fig. 2. The space between the tanks is filled with water, allowing the operator to control the temperature of the cream by pouring either hot or cold water into the tube

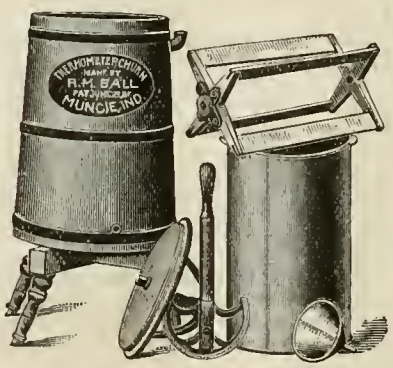

Fig. 2.—Parts of Double Tank Churn.

near the top of the outer tank by the aid of the funnel. Thus the temperature of the cream can be changed in a moment without adulterating it with water. The churn has an indicator in the cover to enable the operator to tell when butter comes, and also to give perfect ventilation. The manufacturer claims that with the churn butter can be made out of any cream, sweet or sour, in from 2 to 20 minutes; that the churn is easily taken apart and cleaned; that there is nothing about it to wear out or to get out of repair: that 1 quart of cream can be churned as well as 4 gallons, and that there is no slopping or dripping of the cream.

The Peerless No. 2 Telephone Outfit.

Robert H. Ingersoll & Brothers, 65 Cortlandt street, New York, are offering the telephone outfit as here shown The parts illustrated in Fig. 1, and the battery in Fig. 3, are furnished in duplicate, providing a call bell, receiver-transmitter, and battery at each end of the line. The receiver transmitter,

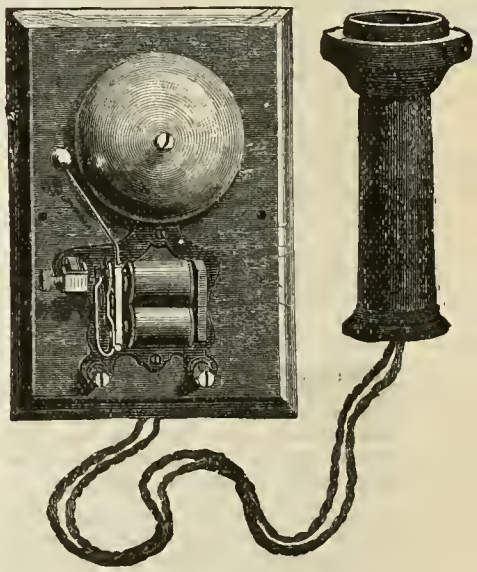

Fig. 1.—Call Bell and Receiver-Transmitter.

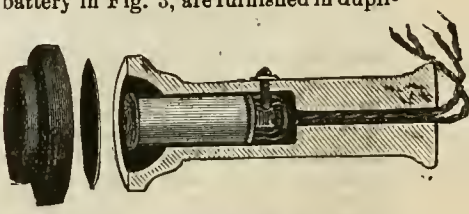

Fig. 2.—Receiver-Transmitter in Detail.

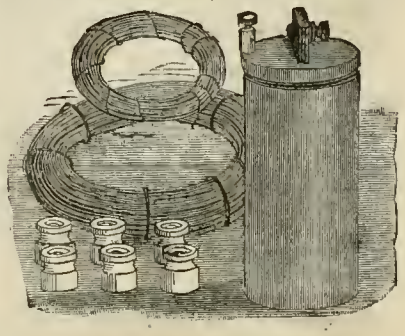

Fig. 3.—Battery and Accessories.

Fig. 2, is a combined instrument which is alternately placed to the mouth to deliver the message, and then to the ear

to receive the answer. It is stated that this will carry sound with the same distinctness on all lines of any length. The call bell, Fig. 1, ordinarily furnished with the outfit is constructed to ring for a distance of 1 mile and under. Bells of greater capability are furnished with outfits for long distances. The bell is mounted on a polished hardwood backboard, from which the receiver-transmitter is suspended by a telephone cord. At the back of the board, concealed from view, are the switches and connections, which are automatically operated by two push buttons at the side of the board, one to ring up and the other to connect the phone with the line wire and battery. The outfit here represented is sold at $7.50, and is guaranteed by the makers to work perfectly over 1500 feet of No. 18 copper or No. 10 iron wire. By adding a battery to each end—making two batteries at each end of the line—the outfit will work to half a mile, and by the addition of another battery to each end it is made to work up to 1 mile. If proper calculation is made in ordering, enough wire, &c., may be shipped to cover all requirements. The manufacturers suggest that where distance will add largely to the cost of shipping the batteries be bought near at hand, if good batteries can be so secured.

Electrical Goods in the Hardware Store.

BY W. P. STEWART.

In considering the advisability of handling Electrical Goods in connection with the Hardware business, the first question is, Does it pay? The experience of the writer is that it does pay in more ways than one.

In the first place, there is a good percentage of profit on the amount invested; in fact, as good as on any line of special or fancy goods usually handled.

In the next place, it evinces the spirit of enterprise and progress that should obtain in every modern Hardware establishment, and shows that it is up with the times.

NO ONE QUESTIONS

the value of this reputation in a business house. Energy, a complete stock and a comprehensive knowledge of the business are sometimes more profitable in the long run than cutting prices.

Provided the stock is not too large and varied, the labor attendant upon handling Electrical Goods is imperceptible, and is not worth considering in the discussion. As to space required, a case less than 3 feet square or a small wall space is ample to display as large a variety of Electrical Goods as it is desirable for a retail house to handle. Several of the manufacturers in this line have prepared at moderate cost just such

A DISPLAY BOARD

as is desirable. Electricity is something understood by few, but of interest to all, and such a display always attracts attention. Many persons who perhaps had no idea of purchasing anything of the sort, or, if they had thought of it, were deterred by the impression that such things cost a great deal, upon learning that, say, $3 or less would pay for a complete electric bell outfit they will invest.

The remark is often made that such things will do for people of means. In point of fact it is to persons of moderate means and with few servants that such conveniences are of the greatest value, while the amount of bother avoided by the use of a simple system of electric bells and speaking tubes has to be known to be appreciated. Of course electrical goods will not

SELL THEMSELVES

any more than other goods will, so it rests with the salesman to appropriately and in a pleasing and interesting manner call attention to the desirability of such appliances. It is not necessary that he be an electrician in even a very limited sense of the term, although some knowledge of the subject is of value, and can be very easily acquired in this electrical age.

It is of great importance in offering such goods not to claim too much. Do not let the desire to make a sale lead you to convey the impression that there is no danger of a bell getting out of order, or of a battery getting weak or giving out. Such things will happen, and it is well to call attention to the fact that the necessary material for maintenance can be easily and cheaply procured.

DIRECTIONS

frequently accompany the outfits furnished by manufacturers, and any person of average intelligence can put them in operation.

In regard to installation, if there is an available man in the house who can be intrusted with the work it would add to the profits, but except in large cities it would hardly pay to keep a man for such work alone. In every community, however small, there is generally some handy man who can do such jobs for a moderate consideration. There are two technical points which it will not be out of place to mention in this connection, a neglect of which has given more trouble than anything else in ordinary domestic work. These are neglect in

SPLICING AND TACKING

up wires. Insist upon long, clean bright and tightly twisted splices, covered with insulating tape, and never under any circumstances let one staple or tack be driven over two wires. Good outfits have often worked for months and then refused to respond to the strongest battery power simply because corrosion had ruined a loose or uncovered splice, or crossed a current where one tack held two wires. Sometimes plastering has to be torn out to get at such work or new wires run outside. Such carelessness does much to hurt the sale of electrical appliances.

In the opinion of the writer the Hardware dealer who can in a moderate way handle these goods to advantage will do well to confine himself to

DOMESTIC APPLIANCES,

which may almost be classed as House Furnishing Goods. The heavier articles in this line, such as are used by street railways and electric lighting stations, can be left to houses which handle such goods exclusively. Call Bells in sets, ready packed and complete, are the best sellers. These can be had with various styles of Bells and pushes or pulls. A neat and familiar device, and one which appeals strongly to every lady, is the floor push to be used under the dining table for communicating with the kitchen. A simple code of signals makes this a great convenience.

The ordinary annunciator, for indicating the source of the call, is a familiar appliance, and is so moderate in price that it can be advantageously handled. A careful examination of the catalogues of several large manufacturers in this line would convey very clear ideas of the many domestic uses to which this great servant of man can be applied.

One of the simplest methods of illustrating the operation of ordinary Bells is to have a push button at the front part of a store and a Bell at the rear or some distance away. This conveys a much better idea of its uses than when the button and bell are both attached to the same small box.

A small stock is all that is needed, as it is so easy in these days of rapid transportation to replenish.

A GOOD ASSORTMENT,

although perhaps not complete, would include the following:

One-half dozen assorted Bell Sets in boxes.

One-half dozen assorted Box Bells, 2½ to 4 inches.

One-half dozen extra Cells Leclanche or other good battery of the same class.

One dozen assorted Wood Pushes.

One dining room Floor Push.

One Floor Push with 6 feet of extension cord and Push for table.

One Circuit Closer to use in connection with an old style door bell pull.

Two dozen extra Zincs.

Two dozen bags Sal Ammoniac.

Ten pounds No. 20 Annunciator Wire.

One two-point Annunciator.

One four-point Annunciator.

One pound package ½-inch Adhesive Tape.

One bronze Door Pull.

One 24-inch bell hanger's Gimlet.

Burglar alarms and gas lighting may be attempted, but as they require a greater amount of labor and technical knowledge, and are more liable to get out of order, had perhaps better be omitted by the average Hardware man.

MEMORANDA.

THE SHOW WINDOW of the hardware store of Weber & Brother, 2209-2211 North Front street, Philadelphia, Pa., is one of more than ordinary beauty and attractiveness, it not being too crowded with display material, and that which is displayed is arranged with excellent taste. The window has another feature which will be more than ordinarily interesting, in that the cutlery and polished steel goods shown have been on display since the window was trimmed for last Christmas, and yet show no marks of tarnishing or dust. The window is made practically air tight, the doors shutting against felt and secured by a tight drawing refrigerator door latch. This window occupies the center of the front and is very wide. Doors enter the store on each side of it and smaller windows are at the sides of both of the doors. These windows show attractive seasonable articles in the house furnishing line.

ON JUNE 1 Louis S. Coe retired from the firm of Edward P. Haff & Co. of this city, manufacturers of Hardware specialties, and will continue in the same business as president of a corporation styled Coe Mfg. Company, 98 Duane street, New York. This concern will manufacture a complete line of specialties in Cork Screws, Tape Measures, Tweezers, Key Chains, Hair Curlers, &c., as well as a large assortment of House Furnishing Hardware. Mr. Coe, who is well known to the Hardware and specialty trade in this city and vicinity, is preparing to bring out a number of useful and attractive articles for the fall trade.

The County Council of London, England, has ordered that all signboards be made of metal, much to the disgust of the carpenters.

STOVE TRADE NOTES.

The Chicago Stove Trade.

The Chicago stove houses are not overrun with business at present. It is usually dull at this time, however, being between seasons. The spring trade is over and fall trade has hardly opened up. Travelers are out pretty generally, but have thus far covered only a small portion of their territory. Here and there some fairly prosperous localities have been struck and satisfactory orders obtained, but between them too often intervenes a wide gap. While manufacturers would like to see a much larger trade in progress, it is a question whether they would not still more increase their anxiety over the probable outcome. As general business conditions are enforcing economy among the people, retail merchants must necessarily be careful in laying in stocks of any kind of goods. But if they were to purchase stoves heavily, in apparent defiance of a day of reckoning, there would be a much closer scrutiny of credits and orders would perhaps be curtailed at the factory end. It is better for stoves to move slowly from warehouses and be paid for promptly than to be rushed into merchants' hands and finally settled for on the basis of so many cents per dollar. Under existing conditions, therefore, business is about as good as can or should be expected.

In reviewing the spring trade, one is struck with a rather remarkable fact. It would be supposed that high grade goods would suffer more seriously than cheaper ones, with the known curtailment in the purchasing power of the people. While this has been the experience of some manufacturers, it was by no means general. Many of them report a less per cent. of shrinkage on their business in first-class ranges, for instance, than in cheap ranges and cooks. Certain styles are growing in favor, notwithstandsng their higher price, and the smaller falling off in their sales indicates a positive gain, which will, of course, show up handsomely when times improve and the masses can again consult their tastes without such close reference to their pocketbooks. They are being educated to the use of better articles in their kitchens as well as neater furniture in their parlors; and as a stove or range is expected to last a great many years, the additional price for a high grade stove is not a serious matter if the time has come when one must be bought.

This naturally brings up the question of prices. No weakness in price has yet developed among manufacturers. They state that their customers are making no demand for better rates. If they wish to buy stoves they are apparently satisfied to pay the price asked when assured that it is an unvarying price to all. Merchants as well as manufacturers realize that no more stoves would be sold even if the price were cut in two, and as long as prices are fair and not so high as to be prohibitory they are not disposed to press vigorously for a reduction. The action taken by the manufacturers at their recent convention thus seems to be well sustained. It would be very unwise to abandon such a conservative policy in the hope of increasing business. Demoralization would inevitably ensue and merchants would reap no benefit from it, while manufacturers would be greatly injured.

Looking to the future, ground for considerable encouragement can be seen. Last year witnessed the culmination of a series of depressing influences such as this country never before experienced. As "the mill can never grind again with the water that has passed," so business cannot again suffer from the misfortunes it has once passed through. The panic is over, the currency question has been settled, liquidation has run its course, the banks are loaded with money and the work of relaying the foundations of business prosperity is well under way. Labor troubles are disturbing us at present to some extent, but they must soon be ended in the nature of things. The number of persons finding employment will continue to increase. From this time forth we may expect to show a steady advance in the direction of better trade and an enlarged spirit of enterprise among the people. Orders for stoves placed during the next two or three months will not be canceled as they were last year, but will be duly filled and more stoves will be ordered after they are sold.

ADVICES from Sioux City, Iowa, indicate that slight hopes exist of the resumption of business by the Sioux City Stove Works, whose plant is in the manufacturing suburb of Leeds. An attempt is being made to locate a number of small manufacturing establishments from other points in the buildings formerly used by the stove works. Should this be accomplished it will of course settle the future of the plant with regard to making stoves. All the other manufacturing concerns at Leeds are now in operation, those which were carried down last year having been reorganized.

Sport Among Stove Men.

The Saturday half holiday last week was made good use of by the employees of the Union Stove Works of this city, when 38 of their number repaired to the spacious grounds belonging to Alfred Semler, keeper of the hotel at Grant City, Staten Island. The boys had prepared an elaborate programme to keep them busy until 10 o'clock that night, and had a most enjoyable time.

Among the many events arranged for the day's outing was a match game of base ball in which part of the store force, known as the "Paragon B's," was pitted against the tin shop boys, who called themselves the "Flirt B.'s," resulting in a victory for the latter by a score of 34 to 19. The trophy, a beautiful stove offered by the firm, was carried off by the victors, who also secured an appropriate medal, for which they contested. The umpire, Mr. Tilson, in this game fared much better than some of the players, who, being rusty for such violent exercise, came out of the game rather sore, to say the least, three of the number, Messrs. Schuler, Pennell and James Myers, sustaining many scratches in their endeavors to extricate themselves from the meshes of a barb wire fence, in which they became entangled after chasing the ball outside the grounds. The teams lined up in the following order:

Flirt B.	Paragon B.
T. Tilson, P.	R. L. Myers, C. and
J. Dougherty, C.	Captain.
J. Gould, 1st B.	L. Hatfield, P.
P. Hammill, 2d B.	R. Smith, 1st B.
H. Young, 3d B.	H. Davis, 2d B.
A. Van Sise, S. S.	H. E Sherwood, 3d B
E. Schuler, R. F.	W. T. Edwards, S. S.
C. Reick, L F.	J. H. Myers, L. F.
J. Worster, Captain, C. F.	W. Froel, C. F.
	G. C. Pennell, R. F.

Umpire—John Tilson.

The second event was a 130 yards dash, in which Mr. Worster of the shop outran by two seconds the dignified bookkeeper of the company, P. J. O'Hanlon; but the laurels of the store were retrieved in a like event between Master D. Strade the tinshop apprentice and Master James Dowling, errand boy, who outran the former by four seconds. The fourth event was a running race between E. Suarez and R. Arguiello, two invited guests, in which the latter was best man. The fifth event, a 130 yards dash between Louis Hatfield and Henry Specht, two of the drivers, was won by Mr. Specht, who was two seconds ahead of his rival at the finish. The sixth event, a penny pitching contest between John Dukes of the shop and Harry Chapman of the store, was won by two pennies by Dukes after a close and exciting contest. One of the most laughter provoking events of the day, and which called forth bursts of applause and vociferous urgings on the part of the respective admirers of the contestants, was a jig contest between Mr. Chapman of the store and Mr. Klug of the shop. Under the spur of continued shouts of encouragement they kept up the dancing for 15 minutes, when the onlookers called it a draw, out of pure sympathy for the principals. In a lot

drawing afterward the conteat was decided in favor of Mr. Chapman.

After supper, to which all sat down at 6 o'clock, and for which all had most voracious appetites, ten pins was indulged in. The following is the *menu* of the supper:

Soup à la Revertible Flue.

Clam Fritters with Fancy Nickel Skirt and Legs.

Roast Beef with Low Hot Closet and Reservoir.

Roast Veal with Asparagus and Lettuce elaborately trimmed with Tile.

Roast Chicken with Burnished Edges.

Cream Cakes with Duplex Grate.

Coffee and Direct Draft Segars.

The bowling contest was participated in by the following:

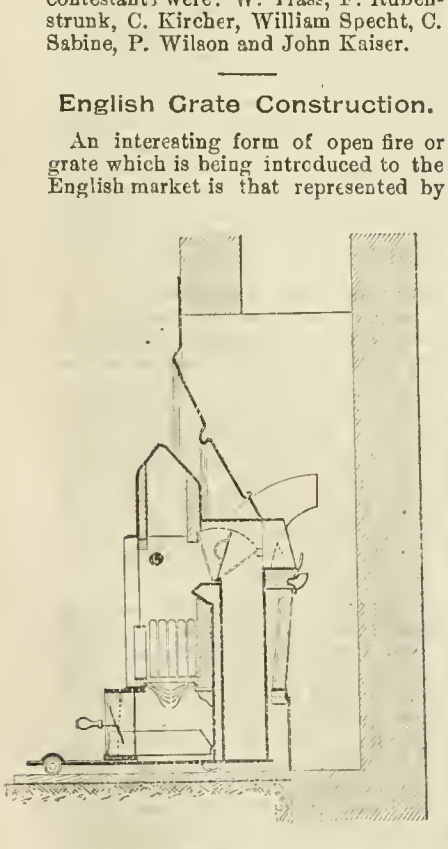
Store.	Shop.
G. C. Pennell,	J. H. Pratt,
J. H. Myers,	John Edwards,
H. E. Sherwood,	E. Jacoby,
R. L. Myers,	E. Schuler,
W. T. Edwards,	C. Reick,
P. J. O'Hanlon.	J. Worster.

It resulted in a victory for the shop hands by a score of 529 to 522.

Charles Specht, a former employee, furnished the music for the occasion on an accordeon, of which he is certainly a master, playing as he does with his nose, ears and chin, and imitated various musical instruments, such as bagpipes, violin, banjo and piano. It was 10 o'clock when the boys boarded the train for home, singing "Two Little Girls in Blue," "Playmates," and several other songs of a *passé* character, and at the imminent risk of being sat upon by other inmates of the car, or of being ejected by the conductor. All, however, voted it one of the grandest outings, marred only by occasional showers, they ever had. Among those present whose names do not appear among the contestants were: W. Trass, F. Rubenstrunk, C. Kircher, William Specht, C. Sabine, P. Wilson and John Kaiser.

English Grate Construction.

An interesting form of open fire or grate which is being introduced to the English market is that represented by



Vertical Section through an English Open Grate.

the sectional view in the accompanying illustration. The arrangement of parts is such, the manufacturers claim, as to result in economy of fuel combined with great efficiency. The device is so made that it may be easily inserted in a fire place, and is furnished with or without a front. The body of the apparatus surrounding the grate is divided by means of fire brick into several chambers, the fire itself constituting the middle division. Above this there is an air flue, for the purpose of carrying the heated air to the fire in order to promote combustion. In the air flue is a register, for the purpose of either allowing a direct draft into the chimney, as in the case of an ordinary grate, or to discharge the products of combustion through the flues at each side of the grate. The arrangement is such that the flues can easily be cleaned by removing covers provided for the purpose, which, in turn, may also be used as ventilators. Where a front is provided there are two sliding mica doors, through the panels of which the light from the glowing coals may stream into the room, thus adding to the cheerful effects produced. The front may be made entirely of cast iron or fitted with tile panels, behind which the mica doors slide when opened. Some of the fronts have perforated borders, through which cold air from the room enters at the bottom, and after circulating about the body of the grate issues at the top in a highly heated condition, thus maintaining a rapid circulation and creating a uniform temperature throughout the apartment. We understand that a room may be warmed in three ways. If the mica doors and register at the back are closed, the fire burns in accordance with the position of the lower sliding door, and the grate yields the largest amount of heat. In the second place, if the mica doors are closed and the register at the back left open, the fire still burns in the manner indicated above, but as there is a direct draft into the chimney only a small quantity of the heat developed is discharged into the room. In the third place, if the mica doors are opened together with the register the fire burns as in the ordinary grate, and, while assisting ventilation, gives very little heat to the room. Ventilation can be secured in the manner indicated by opening a valve in the cleaning covers at the bottom of the side flues. This causes the air from the room to at once be drawn into the flues, and while reducing the draft for the fire gives ample ventilation.

ODD PLATES.

The Excelsior Steel Furnace Company, 38 and 40 West Monroe street, Chicago, have just brought out a new list of furnace fittings. It is printed on a large sheet, 15 x 27 inches, giving illustrations of the various kinds of fittings made by the company. A large addition has been made to the line of stacks and branches. These are now furnished in lengths from 19⅝ inches to 13 feet 6 inches, and can be placed in position without patching or soldering. No solder is used on the hot air pipe, but the joints are double seamed together, while the swedging on the last joint of a length is done with the ridge entirely above the surface, leaving the inside perfectly smooth. This pipe is made up in sections from 14 inches to 5 feet 8 inches in length, each section being complete. Other goods shown are elbows, angles, collars, boots, register boxes, casings, bonnets, and miscellaneous fittings. The price-lists published are very comprehensive, covering all sizes, styles and descriptions of regular and special fittings.

The foundry of Burdett, Smith & Co., at Troy, N. Y., will not resume operations until after July 4. For several weeks the resumption of business has been anticipated by the employees. The foundry has been closed since early last December.

Operations were resumed at the stove plant of Bussey & McLeod, Troy, N. Y., last Monday. The usual force of men was put at work.

Gen. Robert Shaw Oliver, superintendent of the Albany plant of Rathbone, Sard & Co., has been appointed a member of the Civil Service Commission of the city of Albany by Mayor Wilson.

The latest catalogue issued by the Fuller & Warren Warming & Ventilating Company, 43 Milk street, Boston, Mass., is an exceptionally handsome publication. It is of oblong shape, bound in silk, with a finish of gold, while the back is of white with graceful gilt design and the words "Warming and Ventilation" printed in red. The inside of the catalogue is in perfect keeping with the handsome binding. The pages are faintly tinted with white and cream, alternately paneled, the typographical work being done on a paneling of cream color, while the engravings, of which there are many handsome ones, are on a white panel surrounded by a border of the latter color. Large engravings show many school houses and halls and other important buildings in which the Fuller & Warren Warming & Ventilating Company have installed the heating apparatus. Vignettes of some detail of architecture or ornamentation of buildings add much to the charm of the engravings. Of course, the important feature of the work is the description of the warming system that they apply, many interesting diagrams being presented, and full accounts given of the apparatus itself. At the close of the book are many references.

The Southern Stove Works, of which Kiechle, Brentano & Oberdorfer are proprietors, Evansville, Ind., issue an attractive pamphlet, handsomely printed on delicately tinted paper, illustrating the new patterns for 1894 of Our Leader specialties. These include four and six hole wood ranges, embodying the latest improvements and ornamented in a rich and effective manner; a soft coal heater, which is claimed to be mounted absolutely air tight and capable of holding fire 24 hours with soft coal; an attractive Franklin, made in three sizes and having large sliding mica feed doors, capacious ash pan, heavy sheet steel back, iron linings, draw center shaking grate and fire pot, removable through the feed door, and Our Leader four-hole cook stove, made in five sizes for coal and wood. The front cover of the pamphlet is ornamented with a picture of the train containing the company's large shipment of stoves on September 10 of last year, the contents of the train weighing 462,300 pounds, the freight charges being $3107.25.

The Art Stove Company of Detroit, Mich., last week made two shipments of oil heaters to Antwerp and Brussels. The company expect to do considerable business with European countries and are in receipt of numerous inquiries from abroad. They are running their factory with a full force, ten hours a day and six days in the

week. The outlook for a large trade is considered good.

The Joliet Stove Works of Joliet, Ill., are favoring their customers with sheets of blotting paper, one side of which carries a calendar for the month of June and an illustration of Moore's Air-Tight heaters shown with and without casing.

The Sill Stove Works of Rochester, N. Y., issue an attractive folder giving some interesting information relative to the Sterling range, which they manufacture in the usual modifications. This stove is one of the latest additions to the company's already extensive assortment, and is ornamented in a style to please the most fastidious. The effects are rich and artistic and the stove as a whole has a substantial, well made appearance. Particular attention is invited to the fire box, which is extra large, oval in form and has an extra heavy brick lining; also to the company's patent lift-out hearth, which rises up instead of sliding out or swinging to one side, and to the square full size oven which is fitted with patent transparent ventilating double door. By means of the latter fresh air is continually introduced into the oven, while the transparent inner door, fitted with two clear sheets of best India mica, enables the contents of the oven to be seen from any point in the kitchen, while at the same time no risk is run of having a delicate piece of baking spoiled by settling, through the opening of the door. The flues, which are claimed to embody the advantages of both the two-flue and sheet flue systems, without the faults of either, are deep and can be cleaned from the front of the range.

William W. Cornell, who recently died at Poughkeepsie, N. Y., was a native of Troy, N. Y., where he was born 73 years ago. He was a son of the late Latham Cornell and with his father was for many years in the stove business at Troy. The deceased removed from Troy to Poughkeepsie 35 years ago.

The new office building of Cribben, Sexton & Co., adjoining their stove foundry on Erie street, Chicago, is now nearly completed and will shortly be occupied by the firm.

The Peninsular Stove Company, Detroit, Mich., favor us with samples of lithographed hangers with which they are this season supplying their customers for advertising purposes. These are of the usual style and make up, being provided with metal bands at the top and bottom and an eye for hanging upon the wall. The design in each case, however, is far in advance of the general run of advertising hangers, and is of a character to warrant its preservation rather than find a place in the waste basket of the dealer receiving it. In each case the design is different, so as to lend a pleasing variety to the collection. As hangers are issued for advertising purposes it is natural to find some reference to the company's goods printed upon them. The upper left hand corner bears a *fac-simile* of the company's trade-mark, while in the opposite corner is a picture of some one of their leading specialties. The lithograph work is beautifully executed in colors and the designs exceedingly rich and effective.

We have received from the Michigan Stove Company a sample of the patent Schafer lamp shade which they are now furnishing their agents as an advertising device. It consists of a tin holder or spreader to fit on the chimney and a decorated paper shade which folds flat. The *Garland Magazine*, which has also been received, is a 16-page publication, filled with literary miscellany and occasional allusions to Garland stoves and ranges. It is intended to be furnished to dealers for distribution in their immediate vicinity. In such cases the dealer's name is printed on the magazine and copies are furnished him at a very low rate. Circulars are also inclosed giving practical hints in advertising Garland stoves and ranges.

Isaac A. Sheppard & Co. of Philadelphia have been busily engaged in extending their lines of goods, particularly as regards furnaces. Their heating stoves this season will embody some important modifications and improvements, and their line of Fidelity ranges has been enlarged and improved. They are about to place on the market a new four and six hole range in three sizes, bearing the name Royal Excelsior. The range has an end ash pit, high hot closet and reservoir, and will doubtless be in good demand when the season opens.

The Mount Penn Stove Works of Reading, Pa., have issued an eight-page catalogue under the heading "Cellar Furnaces." In it are described and illustrated the Radiant hot air portable furnace, steel drum and crab construction, with single or double casing; the Model portable hot air tubular furnace, and the Palace, a new furnace just introduced as a very cheap and effective cellar furnace. The latter is a steel drum furnace with horizontal air flues and made in three sizes. The last page of the catalogue is devoted to dampers and trimmings.

The Excelsior Steel Furnace Company of 38 and 40 West Monroe street, Chicago, are filling their warehouse at above numbers with furnaces, boilers, heaters, furnace fittings and supplies in anticipation of an active fall trade. At the opening of the shipping season they expect to have on hand fully 1000 furnaces and boilers.

The Front Rank Steel Furnace Company, St. Louis, Mo., have moved from 713 North Main street to larger and more commodious quarters at 705–707 North Main street. In their new location they will occupy two buildings, each four stories in hight. The first floor will be utilized as an office and showroom. Particular attention will be paid the latter. It will be inclosed by partitions of finished white pine, the upper portion being of glass, arranged so as to swing outward, thus obtaining all the necessary ventilation. Arrangements regarding the decoration of the sample room and office are not as yet completed, although it is expected that ornamental sheet iron ceilings and side walls will be used. The sample room will contain a full line of their Front Rank steel furnaces, which will be displayed with and without casing, and also in sections. They will also show their Front Rank water heater, which is just now creating quite a stir in the trade. This water heater was not completed until the latter part of the winter season and their trade was naturally limited. They have completed a number of contracts, however, and those that have been used have given entire satisfaction. The second floor of their new plant will be used as a sheet iron and sheet steel shop, the third floor as tin shop, while the fourth floor will be utilized as a pattern shop. The change made in the location of their plant will enable them to increase their capacity by at least 50 per cent. The two buildings occupy ground 50 x 180 feet.

Buck's Stove & Range Company of St. Louis, Mo., are directing the attention of the trade to the iron clad guarantee which they give in connection with their line of Buck's stoves and ranges They are distributing *fac-similes* of the warranty which they give with every stove made, and point out that the reason their stoves are more durable than others is because no scrap or old iron is used in their construction. Accompanying the warranty is a neat folder entitled "Health and Economy," which deals with the merits of Buck's stoves.

The Rapid Transit Stove & Furnace Company of Baltimore, Md., have issued an illustrated catalogue of their specialties made under the patents of J. B. Oldershaw. Attention is invited to an interesting assortment of heating stoves, furnaces, fire place heaters, &c., the illustrations being accompanied by descriptive letterpress. Instructions are given for setting the Grand Rapid and Rapid Transit fire place heaters, as well as for the Resplendent heater. Some of the goods are made as double heaters, these including the Delta, Diffusive and Rapid Transit.

Hess, Snyder & Co., Massillon, Ohio, are distributing to friends in the trade copies of their 1894 furnace catalogue. It is a book of 84 pages bound in board covers and gives a detailed description of the Boomer furnace, which the makers state has been thoroughly tried and tested. They refer especially to its durability, economy and cleanliness. The illustrations show the furnace in sections and general views and adapted for high and low cellars, Ample descriptive letterpress accompanies the illustrations, and the matter is presented in such shape as to prove interesting and valuable to dealers handling these goods. Not the least important feature of the publication is a partial list of churches and schools in which the Boomer furnace is used, as well as a long list of testimonial letters from those who have practically demonstrated the merits of the heater.

Advices from Phillipsburg, N. J., are to the effect that the Phillipsburg Stove Works will operate their plant three days a week until further notice.

We are indebted to the Carton Furnace Company, Utica, N. Y., for a copy of a circular which they have received from Stearns Brothers, Detroit agents for the Carton furnaces. The circular gives a list of names of some of the dealers who handle the goods named and who have been using them from one to ten years.

Hansell & Belson have now arranged their showrooms, at 144 North Second street, Philadelphia, with the different lines of goods they will handle. They will make a specialty of the stoves of Charles Noble & Co. The second floor front will be entirely devoted to the display of their new Liberty steel ranges and the Dazzle cooker, made by the Philadelphia Stove & Iron Foundry Company. They are selling four grades of oil stoves, of which the Game and Enterprise are leaders. They also handle five grades of gas stoves and ranges, the Enterprise line of Luther & Lederhos occupying the leading position. Their gasoline leader is the Aurora Process, and they sell Moon's

patent flame spreader oven for all their oil, gas and gasoline goods. They also have the agency for their section of the Grinberg Star elbow. They have adopted a trade-mark in which Iron King and Liberty stoves and ranges are the features.

The Reading Stove Works, Reading, Pa., propose starting up in a few days their Millmont plant, with a full force of workmen in all departments. The reason for this is that their warehouse at Foundry No. 2, which with Foundry No. 1 has been running full thus far the present year, is filled with goods, and as the future production must be stored at Millmont, it is much more convenient for the company to make the stoves there than it is to turn them out in Reading and haul them ¾ mile to the warehouse at Millmont. As soon as operations are resumed at the Millmont plant Foundry No. 2 will be closed, for the reason that present trade conditions do not warrant operating more than two-thirds of the company's full capacity. Business is very quiet just now, but the outlook for the fall trade is regarded as favorable. From the above it will appear that the starting of the company's Millmont plant is not due to the receipt of "a large order for heaters of a special size" which cannot be made at their plant in Reading, as some of the newspapers have stated.

The Pittston Steel Range Company, Pittston, Pa., with a capital stock of $10,000, were chartered on Friday, May 25, with the following directors: George B. Reap, M. N. Donnolly, James Kennedy, John Brown and Dr. Joseph Reap.

The Denver, Col., newspapers state that on the 28th ult. the Kibler Stove Works met with an annoying loss in the destruction of a portion of their patterns by a fire which originated in an adjacent plumbers' supply foundry.

The Dippo Mfg. Company of Cleveland and Chagrin Falls, Ohio, have issued an illustrated catalogue of three specialties in their line of Ferrosteel ranges. These goods are made from original patterns and are constructed in the company's works located at Chagrin Falls, about 10 miles out of Cleveland. The ornamentation is of a pleasing character and the constructive features such as to command favorable attention at the hands of the trade. The catalogue consists of 16 pages, presenting half-tone illustrations of several varieties of the Ferrosteel ranges. Accompanying the engravings we find descriptive letterpress together with tables giving the sizes in which the stoves are made, the dimensions of the ovens' code words and prices.

We are indebted to Louis L. Tribus, C.E., 84 Warren street, New York, for a pamphlet copy of a paper read by him last February before the American Society of Civil Engineers, of which he is an associate member, on the subject of driven wells of the Plainfield, N. J., water supply system. The paper gives a very clear and concise account of the water supply system adopted at Plainfield, and numerous engravings make plain all the essential features of it. The wells have been in operation for over two years with the most satisfactory results as to the quality and quantity of water, and are but one of the many examples of the efficiency of the driven well system of supply. In the discussion following the paper reference was made to the similar systems at Natchez, Miss., Topeka, Kan., Dayton, Ohio, and other cities. Mr. Tribus was resident engineer during the construction of the work and is well qualified to express opinions on the important matter of water supply.

SCRAP.

According to the monthly Treasury statement of imports and exports for April, the amount of tin and terne plates held in bond in the United States on April 30, 1894, was 49,246,079 pounds, valued at $1,240,992, as compared with 25,114,881 pounds, of the value of $681,071, held on April 30, 1893, showing an increase of nearly 100 per cent. This increase has become still larger during the month of May and is attributable entirely to uncertainty in regard to the tariff.

The Baltimore Iron, Steel & Tin Plate Company are moving their plant from Clinton and Second streets, Canton, to Locust Point, Md. The firm have secured a lease for three years on the property and plant of the old Coates Rolling Mills, at Locust Point, with the option of purchase.

Bruce & Cook, 186–190 Water street and 248 and 250 Pearl street, New York, are offering to the trade a new brand of American roofing tin named Petrel, which is being made especially for them. It is described as a highly finished bright coated terne plate equal to P. T. L. Another specialty of the firm in American roofing plates is W. T. R., a dark finish terne of Worcester grade. Messrs. Bruce & Cook report a large and growing demand for these domestic plates.

A member of the New York metal trade, who has recently returned from a Western tour, in the course of which he visited a number of the American tin plate works established west of the Alleghanies, describes their importance and activity as astonishing. Leaving the city in the character of a skeptic open to conviction, he has returned an enthusiastic convert. The progress of the large tin plate concerns established in Indiana, Western Pennsylvania, Ohio and Missouri he found to be remarkable. All were filled up with orders and only feared the effects of the coal strike. The magnitude of the works of the St. Louis Stamping Company at St. Louis, Mo., appears to have produced a particular impression on this individual's mind. That tin plate manufacturing is already an established and important industry in this country is, he says, not in the least doubted in the West.

Laufman Tin Plate Company, whose works are located at Butler Junction, on the West Penn Railroad, with post office address at Freeport, Pa., issue a neat circular calling attention to their brands of American roofing tin, and giving a number of flattering testimonials from metal roofers in various parts of the country in regard to their plates. In addition to their well-known brand of guaranteed roofing tin—Laufman's Apollo, the firm are making and offering to the trade the following roofing plates: Tip Top, described as a machine made, full coated and squared terne; Allegheny, machine made and squared, and Freeport, a hand redipped and resquared plate. The last named is the latest addition to the firm's products. All these plates are made with a palm oil finish. The Laufman Tin Plate Company roll their own black sheets from best decarbonized steel, and all their plates are guaranteed to double seam.

N. & G. Taylor Company, Philadelphia, Pa., report that the output of tin plates for the week ending May 26 was the largest since they started their works some two years since. They are enjoying an excellent demand for their bright and roofing tins.

Estimates and plans are being prepared for a tin plate plant to be added to the Lalance & Grosjean Mfg. Company's rolling mills, at Harrisburg, Pa. The company's mill in that city has a large capacity in the production of black sheets for tinning purposes. Most of this product is used in the firm's own tinware factory on Long Island, and the balance has been in great request by tin plate makers.

A fire was discovered on the morning of June 2 on the fourth floor of N. & G. Taylor Company's store, at 395 Branch street, Philadelphia. The flames, which were sufficiently fierce to melt the pig tin stored there, were fortunately confined to that one section of the building by means of the iron fire proof doors, and the fire was quickly subdued. The loss is estimated at about $2000, and is fully covered by insurance. The origin of the fire is unknown.

In the burning, last month, of the Clyde Line wharf, on the East River, New York, a considerable number of boxes of imported tin plates were destroyed or damaged.

A London cable dispatch reports that the works of the Pontymister Tin Plate Company, Newport, and of the Maesteg Tin Plate Company, Llwydarth, two of the most important tin plate works in South Wales, started into operation again this week.

New Publications.

Directory of the Iron and Steel Works of the United States, Canada and Mexico. Compiled and published by the American Iron & Steel Association, Philadelphia.

James M. Swank's directory of the iron and steel works has always been the closest approach to the ideal of such a publication with which we are acquainted, and is thoroughly appreciated in the trade, by which it is regarded as a standard work. With the growth of the industry the difficulties attending its compilation are growing steadily. It is so thoroughly known that it requires little more than the announcement that a new edition has been issued to commend it to those interested. It contains as usual a full list of the blast furnaces, rolling mills, Bessemer steel works, open hearth steel works, crucible steel works, plate and sheet mills, cut nail factories, stamping works, forges and bloomaries, wire rod and wire mills, wire nail factories, bridge building works, iron and steel shipbuilders, horse nail works, locomotive works, cast iron pipe shops, wrought iron pipe works, car axle makers, car wheel foundries, and car builders. Similar information is furnished for Canada and Mexico.

The Tin Mill Ready Reckoner. By Ambrose Beard, New Philadelphia, Ohio. Price, 75 cents.

Mr. Beard's "Tin Mill Ready Reckoner" is a handy little pamphlet which contains a series of tables of calculations for quickly computing the wages of tin mill rollers, doublers, heaters and shearmen under the Western scale.

TRADE REPORT.

The Iron Market.

Pig Iron. — In the New York market, although some of the Southern furnace companies have advanced their asking prices, there is no evidence that buyers are paying more. There is some scarcity, however, in Soft grades. While the threatened advance in freight rates has stimulated shipments the fact remains that the current demand is not heavy. We quote standard brands $12.50 @ $13 for No. 1; $11.25 @ $12 for No. 2, at tidewater. Southern Iron, same delivery, $11.50 @ $12.25 for No. 1; $10.50 @ $11 for No. 2; $10 @ $10.25 for No. 3; $10.25 @ $10.75 for No. 2 Soft, and $10.50 @ $11 for No. 1 Soft. Foundry No 4 (Foundry Forge) is $9.75 @ $10.25.

There is more doing in Pig Iron, and prices, if not fractionally higher, are certainly well maintained in the Philadelphia market. There is no very strongly defined increase in the demand, but with so many furnaces banked, and the prospect of higher freights from the South and West, holders are less urgent in making sales, unless at figures that come pretty close to $11.75 for No. 2 X, and $10.50 @ $10.75 for ordinary to good mill Irons. Several sales of 1000 tons each and upward have been made of the ast mentioned at $10.50, which appears to be an inside quotation for that class of Iron, although there are full supplies at that figure for Philadelphia deliveries and at 25¢ @ 30¢ less at points such as Harrisburg and York. General quotations for Philadelphia and equivalent points are about as follows :

andard No. 1 Foundry X....	$12.50 @ $12.75
Standard No. 2 Foundry X....	11.50 @ 11.75
No. 2 Plain.....	10.75 @ 11.00
No. 1 Soft.....	11.50 @ 11.75
No. 2 Soft.....	10.75 @ 11.00

Advices from Chicago indicate that the market is hardening. Large sales of local Coke Iron have been made at firm prices and offers are refused which would have been accepted only two weeks since. Manufacturers again appear to be in command of the situation and consumers are gradually recognizing this fact. Southern Coke is quiet. Such Iron as is now selling is on the basis of a price at the furnace, and not delivered, as makers will not take chances of an advance in freight rates. Sales of Lake Superior Charcoal Iron are reported in somewhat larger quantity than for several weeks past. Bankrupt stocks are now disappearing and the market is working into better shape. Quotations are given as follows for cash:

Lake Superior Charcoal.....	$15.00 @ $15.50
Local Coke Foundry, No. 1...	11.25 @ 11.50
Local Coke Foundry, No. 2...	10.50 @ 11.00
Local Coke Foundry, No. 3...	10.00 @ 10.50
Local Scotch.....	11.50 @ 11.75
Ohio Strong Softeners No. 1..	13.00 @ 13.50
Southern Silvery, No. 1.	..... @ .....
Southern Silvery, No. 2.....	..... @ .....
Southern Coke, No. 2..... ...	10.00 @ 10.35
Southern Coke, No. 3.....	9.75 @ 10.00
Southern, No. 1, Soft.....	10.25 @ 10.50
Southern. No. 2, Soft.....	10.00 @ 10.25
Tennessee Charcoal, No. 1...	. ...@ .....
Tennessee Charcoal, No. 2....	..... @ .....
Alabama Car Wheel.....	17.50 @ 18.00
Jackson County Silvery.....	15.00 @ 16.00

The Pittsburgh market is reported bare of sales and of material as well. Mill Iron is stiffening in price, and $9.75, Pittsburgh, is the minimum price to-day, a sale of 500 tons having been made at that figure last week. There is little or no demand for Foundry Iron, but in spite of this furnaces are asking more money, and it is doubtful if $10.75, Pittsburgh, for No. 2 could be shaded. A sale is noted of 300 tons No. 1 Foundry last week, at a price equal to $11.20, Pittsburgh. In the present situation with no transactions occurring, quotations are merely nominal. For spot deliveries the following prices are quoted:

No. 1 Foundry..	$11.50 @ $11.75 Cash.
No. 2 Foundry.....	10.75 @ 11.00 "

The situation in the Cincinnati Pig Iron market has been much the same as the previous week. Some furnaces with Pig Iron to sell have met the demand quite freely, but there were no large transactions, and yet the aggregate of the jobbing sales was considerable, and while the bulk of trade was for Foundry Coke Iron, there were larger proportionate sales of Southern Charcoal Iron. There are comparatively few Southern furnaces that have Iron to sell, and they are talking higher prices, but the scarcity of fuel is decreasing the demand as well as the supply, for many of the jobbing foundries in the district are closing because they cannot get Coke or Coal. The market closed strong. Quotations are unchanged, but are scarcely more than nominal, as follows:

Southern Coke, No. 1.....	$10.25 @ $10.50
Southern Coke, No. 2.....	9.25 @ 9.50
Southern Coke, No. 3.....	8.75 @ 9.00
Ohio Soft Stone Coal, No. 1....	14.50 @ 15.50
Ohio Soft Stone Coal, No. 2....	14.00 @ 14.50
Lake Superior Coke, No. 1.....	12.50 @ 13.00
Lake Superior Coke, No. 2.	11.50 @ 12.00
Hanging Rock Charcoal, No. 1..	17.00 @ 17.50
Hanging Rock Charcoal, No. 2..	16.50 @ 17.00
Tennessee Charcoal, No. 1.....	13.00 @ 13.50
Tennessee Charcoal, No. 2.....	12.00 @ 12.50
Standard Southern Car Wheel	16.25 @ 17.00
Lake Superior Car Wheel and Malleable.....	16.25 @ 16.75

The only feature of interest in the St. Louis market is the scarcity of No. 1 Foundry. The output of this grade of Iron is very limited, and $8.25 @ $8.50 is now quoted for prompt shipment. The consumption of Iron is limited, which is, however, offset by the limited production. Consumers being unable to obtain their usual supply of Coal, Coke, &c., are also reducing their shipments of Iron, and furnaces have no alternative but to hold the Iron for further instructions. Prices are firmer all along the line, but are not as yet quotably higher. We quote as follows for cash, f.o.b. cars St. Louis:

Southern Coke, No. 1 Foundry	$11.00 @ $11.25
Southern Coke, No. 2 Foundry	10.00 @ 10.25
Southern Coke, No. 3 Foundry	9.75 @ 10.00
Southern Car Wheel.....	17.00 @ 18.00
Lake Superior Car Wheel..	16.25 @ 16.50
Ohio Softeners.....	14.25 @ 14.50

The past season has been a hard one for lake marine insurance companies, owing to the unusually large number of vessels lost on the lakes. The companies are advancing their rates from 50 to 150 per cent.

Metal Market.

Pig Tin.—Wholesale prices have moved slowly but steadily downward, and show for the week a decline of about 0.20¢. The fall is due in part to lower London market, but increasing supplies and dull general trade have helped in some degree. Spot stocks increased last month to the extent of about 305 tons. Thus far this month 225 tons have arrived. There are now afloat 1900 tons. The available supply for early delivery is about 3000 tons, or 750 tons larger than a month ago. European and American visible supply combined was 18,983 tons June 1, showing an increase of 2593 tons since January 1. The demand for Pig Tin for consumption is referred to as commonplace in the extreme. The jobbing price for small lots of Straits Pig is 21¢ @ 21¼¢ ℔ lb for small lots.

Copper.—The market is somewhat unsettled and weak, owing to the placing of orders for a large quantity of Lake Superior Ingot for delivery several months ahead at a very low figure. The amount is understood to be about 10,000,000 lb. Cheap grades of Copper for prompt delivery are rather scarce, but the present requirements of consumers are moderate and business limited in volume. Prices for small lots are unchanged at former quotations.

Sheet Copper.—No improvement worth mentioning has developed in the demand for Sheet Copper. Purchasing by consumers continues on a cautious, narrow scale. Prices are unchanged and firmly held. For small lots from store a 15¢ ℔ lb, net, basis is the rule.

Pig Lead.—A more active general market has been experienced, and at the close it showed a better tone than has been the case of late. Some good sized transactions are reported to have passed, but the current jobbing demand for both Pig and Manufactured Lead presents no new features, either in the way of improvement or the reverse. For American Pig, in moderate quantities, 3⅞¢ @ 4¢ is the ruling price.

Spelter.—There is little business doing in Spelter in this market, which remains dull and somewhat weak. Prices are not, however, any lower. Small lots of Western fetch about 4¼¢ ℔ lb.

Sheet Zinc.—Another sharp advance has occurred in the price of this material during the past week, and it is expected that quotations will go still higher, owing to the closing down of the works, following on the scarcity of fuel. Meanwhile the demand is tame, but enough to cause a steady shrinkage in stocks. Current quotations are 5½¢ ℔ lb for 600-lb casks, and 6¢ for smaller quantities.

Antimony —Only a routine business is doing, yet enough to keep prices steady. Quotations are unchanged.

Nickel.—About 45¢ @ 50¢ is quoted for fair sized lots, with the usual premium in smaller quantities.

Tin Plates.—The condition of the Tin Plate market is one of uncertainty

and suspense. Business is irregular, being good one day and flat the next, while the general policy continues to be to proceed cautiously with both spot purchases and orders for forward shipment. In the early days of the week some little impetus was given to trade by the placing of a few good sized orders by Southern Can makers, but inquiries from this class of consumers slacked off toward the close of the week. The cold and stormy weather experienced of late has given a set back to canning operations for the present, but requirements from this quarter may again revive with the advent of more seasonable weather. There is a fairly active demand for Roofing Ternes, especially those of domestic manufacture, prices for which are well maintained. General Tin Plate quotations show no radical change. Concessions are, however, less easy to obtain, owing to decreased importations and gradually lessening stocks on this side.

A special cable dispatch from London to *The Iron Age*, dated June 6, describes the British Tin Plate market as firmer. There is more inquiry for forward deliveries, but sellers are asking a large premium and that checks business. Prompt shipments are in poor request, however, with Bessemer Cokes at 10/. Ternes are stiffer on better demand. Swansea quotations are as follows:

Bessemer Cokes, 14 x 20..... .. 10/	@ 10/1½
Siemens Cokes, 14 x 20. ...10/4½	@ 10/6
Ternes, double box. 18/6	@ ..
Charcoals..... .....13/	@ 15/

Sheet Iron.—Black Sheets for tinning are in particularly good demand, and some heavy sales have been made. Manufacturers' books are well filled with orders, and Tin Plate works are experiencing some difficulty in obtaining a sufficient stock of plates for the purposes of their busines. Other qualities of Black Sheets are in moderate demand, and prices display a firmer tendency. Galvanized Iron is rather more active, with prices firm at 75 % @ 75 and 5 % off for small lots from store.

MATTHAI, INGRAM & Co., Baltimore, Md., issue a supplementary catalogue showing the recent additions to their line. It is to be used in connection with their general catalogue No. 20 or No. 21. They announce also that they have new goods in contemplation and will be glad to receive inquiries from the trade. The present supplementary volume contains 25 pages with illustrations and prices and relates to Dippers, Ladles, Skimmers, Coffee Pots, Tea Kettles, Pails, Buckets, Ash Pans, Oil Cans, &c. A second catalogue that they are distributing is a neat little pamphlet bound in gray with silver lettering, devoted entirely to what they term "Old Time" Tinware, which is the name they use as a trade-mark. Old Time Tinware is wrapped, tagged and labeled, and it is specified that the best care is bestowed upon the packing and shipping. They also emphasize the high grade of the articles. The Ware includes a large assortment of Kitchen Utensils, such as Tea Pots, Coffee Pots, Boilers, Saucepans, Sauce Pots, Cups, Dippers, Bowls, Baking Pans, &c. Among the other articles enumerated are Dinner Kettles, Funnels, Scoops and Wash Boilers. All the goods are illustrated and full price lists are given.

Reports from the Northwestern States point to excellent crop prospects in nearly every district. The promise of a large yield was never better at this season of the year.

Chicago Report.

Scrap.—No change has been made in the following list of buying prices, Chicago delivery:

	Per net ton.	Per lb
No. 1 Wrought Scrap.....	$7.00	....
Machinery Cast.....	6.00	....
Malleable Cast...	5.00	....
Stove Plate (free of burnt)..	4.00	....

According to a recent opinion rendered by Attorney-General Olney, merchandise that has been in bond for the full limit of time may be exported and brought back again as an original importation entitled to another three years in bond. This opinion traverses a recent decision of the Solicitor of the Treasury that such goods could not legally be reimported with the privileges of an original importation. In view of prospective tariff reductions, the Attorney-General's decision will have a considerable interest for the owners of some classes of goods now lying in bond which have nearly reached their limit.

The official Treasury statement places the stock of gold, gold coin and gold certificates in the United States, on June 1, at $665,000,000. Of this amount the national banks of New York State hold $85,700,000, Illinois coming next with $26,000,000 and Pennsylvania third with $20,650,000.

May's fire losses in the United States, according to the lists published by the *Journal of Commerce*, reached a total of $10,777,800, compared with $11,540,000 in the previous month and $10,427,100 in May, 1893.

CONDITION OF THE

Hardware Trade.

CAREFULLY assorted orders for small quantities of goods have characterized the trade for the past month, though the opinion is generally expressed that the volume of business for May compares favorably with the preceding months of the year. The market on Wire Nails shows considerable strength at the recent advance in price, though there is a disposition on the part of buyers to purchase only for immediate requirements in anticipation of lower prices. The unfavorable weather for the past two weeks has added to the sluggishness of trade, diminishing the demand for such seasonable goods as Lawn Mowers, Freezers, Hose, &c., while restricted building operations limit the demand for Builders' Hardware. There is, however, every reason to expect a continuance of the present volume of business, except perhaps such a falling off as may naturally be attributed to the ordinary dull summer months upon which the trade is about entering.

Advices from Chicago.—The Shelf Hardware jobbers are enjoying a somewhat better trade than had been expected after the advance in Western freight rates last week. Orders have kept up from the various parts of their territory in good shape. They are not large, but fairly numerous, and the influx is steady. Very little buying is being done for stocking up, but the demand seems to be continuous for assorting. Even the trade in seasonable goods continues along in about the same way with a regular demand for small lots, showing that the trade is being kept well in hand and that the future has not been anticipated to any extent. For this reason jobbers are inclined now to believe that trade may continue steady for another month at least. A disposition is noted in some directions to increase orders for staple goods, probably owing to the strength of raw materials, which is perceived by all who are in touch with the iron trade. Wire Cloth is firm at $1.60, with an unusual demand recently for large quantities from unexpected sources. House Furnishing Goods and Tinware are dull and are expected to continue so until workingmen are better employed. Roofing Plates are scarce and firm. Heavy Hardware jobbers have had much better trade during the past two weeks, which is largely in consequence of the closing down of so many mills, thus throwing business into jobbers' hands which usually goes to the manufacturers. This is a trade which is liable to be cut off soon by resumption of mills, but in the present uncertain condition of labor troubles may last for some weeks.

Notes on Prices.

Wire Nails—The Wire Nail market still shows an upward tendency and continues strong at the advance noted last week of $1 15 in car lots at mill. Owing to the higher price of raw material manufacturers show no disposition to shade these figures, although buyers are ordering in limited quantities to meet present requirements. Small lots from store in New York are held at $1.25 to $1.30

Advices from Chicago.—The advance in freight rates from the East on the 15th is mentioned by manufacturers as an additional element of strength in the Wire Nail market, which will fortify the position they have taken for advanced prices in consequence of dearer raw material. Some large sales have

recently been made to jobbers in the Northwest, but orders in this immediate vicinity have been comparatively small, as large stocks are still held here which are offered at prices a little below those made by manufacturers. Quotations on factory lots are still about $1.20, Chicago, but manufacturers talk of advancing this week. Small lots from stock are selling at $1.20 to $1.25, and jobbers report an increasing inquiry from the retail trade.

Cut Nails.—There is no change in the condition of the Cut Nail market, while the same conditions which prevailed last week continue to strengthen prices. Quotations remain unchanged and only a fair demand is reported. Eastern mills are quoting 95 cents to $1 for Nails delivered on dock in New York. Small lots from store are held at $1.10 to $1.15.

Chicago, by Telegraph.—Local manufacturers of Steel Cut Nails have had a good trade and report specifications coming in freely on orders they have booked. Prices on factory lots are continued at 90 to 95 cents on 55-cent average. Jobbers have had a somewhat lighter trade in Cut Nails recently, but quote prices at $1.10 to $1.15 from stock.

Barb Wire.—The demand for Barb Wire is only moderate, with no change in the condition of the market. Prices continue firm, the market being represented by the following quotations for Four-Point Galvanized, delivered at the points named: Pittsburgh, $2.05 to $2.15; Cleveland, $2.10 to $2.20; Cincinnati or Allentown, $2.15 to $2.25; Chicago or New York, $2.20 to $2.30.

Chicago, by Telegraph.—Manufacturers state that while shipments of Barb Wire are not so heavy as before the recent advance in freight rates to the West, yet they are keeping up better than had been expected. The advancing tendency in the price of Iron and Steel seems to be stimulating buyers to take in larger stocks of Barb Wire and for this reason trade continues in fair condition. Prices are very firm, in some cases an advance being asked, but for the present prices of Galvanized may be quoted at $2.30 to $2.35 in small lots, with 10 cents off for carloads.

Chain.—The Chain market continues without important change in its general features. The demand is referred to as small, but the manufacturers have avoided accumulating heavy stocks, so that the amount of Chain on hand at present is unusually light. Prices have been somewhat unsettled and lower figures are named, but there is at present a disposition to refuse to make further concessions. Jobbers have, with very few exceptions, been buying from hand to mouth and their stocks are unusually light.

Boss Instantaneous Mending Cone.—P. D. Murphy, Lockport, N. Y., is putting on the market this article. The Cones are sold to the trade at the following net prices:

One box	$0.25
One dozen boxes	2.00
Three dozen boxes	5.25
Six dozen boxes	9.00
One gross	15.00

Glass.—Little of interest has transpired during the past week in the Glass market, while the demand continues restricted. The rainy weather of the past two weeks has retarded building operations throughout the country, and has to a large extent affected the distribution of Glass. Prices, as a rule are well maintained, although under some conditions quotations have been shaded. The New York market is represented by quotations on American Window Glass of 85 per cent. discount for single and double strength Glass in car lots, and 80 and 20 per cent. discount in smaller quantities. Plate Glass is in fairly good demand, with prices firm at 70 and 5 per cent. discount.

Old Metals. — Business is quiet. Some comparatively large sales of Scrap Iron have been made during the week, but generally at prices which touched bottom figures. The following quotations represent about the dealers' prices paid in this city for Old Metals:

Heavy Copper	₩ lb	6¾¢
Light and Tinned Copper	₩ lb	6 ¢
Heavy Brass	₩ lb	4½¢
Light Brass	₩ lb	3¾¢
Lead	₩ lb	2½¢
Tea Lead	₩ lb	2¼¢
Zinc	₩ lb	2 ¢

Manila Rope	₩ lb	2⅛ @	2¼¢
Jute Rope	₩ lb	1½ @	1¾¢
Mixed Rope	₩ lb	¾ @	1⅛¢

Old Rubber.—The following are about the prices for Old Rubber, delivered in New York, except where otherwise stated:

Car Springs, ton lots, ₩ lb.	@	$0.03½
Rubber Shoes, carloads, delivered at factory, ₩ lb.	@	.03½
Rubber shoes, less than carloads, ₩ lb.	@	.03¼
Large Hose, ₩ ton	@	12.00
White Wringer Rolls, ₩ lb.	@	.03¾
White Syringes, ₩ lb	@	.03¾

Trade Notes.

"Poison in the Pot" is the startling title of a little circular issued by Manning, Bowman & Co., 57 Beekman street, New York. The meaning of this frightening title is explained in the inner page of the circular, where it is pointed out that cheap copper Pots, nickel plated, are often dangerous vessels to use. Lead is apt to be present, and verdigris forms from the copper. At the close the merits of the white porcelain lined Agate Ware are touched upon.

The New Era Iron Works, Dayton, Ohio, issue a pretty little circular relating to the New Era Gas and Gasoline Engines of their manufacture. A general description is given of Gas Engines, and it is pointed out that they are very convenient and economical for many purposes. Particular emphasis is laid upon their desirability for electric lighting.

B. F. Perkins & Son, Holyoke, Mass., publish a neat illustrated catalogue and price-list of their manufactures. Their specialty is the Perkins Improved Ventilating and Exhaust Fan, which is made for vertical and horizontal setting; also Wall Fans, Mill Ventilators, Blower Fans, &c. They also make a Fan with high speed engine connected with it. All these Fans and Blowers are illustrated in the catalogue, and descriptive particulars tell of their important features. Their improved Fan Box is the subject of a special notice. An interesting feature of the circular is the account of their method of testing Fans. Following the notice of the Fans is a long list of testimonial letters and references. Special machines and fittings for paper makers are noted at the end of the pamphlet.

The New Era Iron Works have been incorporated at Dayton, Ohio, with a capital of $50,000, to manufacture Gas Engines and iron specialties. Their Engine, the New Era, which, we understand, has been in successful operation for nearly two years, will be built principally in the larger sizes, and especial attention given to its construction for private electric light plants.

The Excelsior Steel Furnace Company, 38 West Monroe street, Chicago, in their advertisement in this issue give an illustration on a large scale of one of their complete double Stacks. These are made 10 feet 6 inches long, with heads and nailing straps attached, ready to put in without piecing or soldering. The company manufacture and carry in stock nearly 400 different sizes and lengths of double and single Stacks.

The advertisement elsewhere of the Bolgiano Mfg. Company, 415 Water street, Baltimore, Md., will be of interest to many readers. The two specialties alluded to are the Little Giant Water Motor and the Perfection Gas Iron.

R. E. Dietz Company, 60 Laight street, New York, advise us that they are doing a very good export trade, mentioning one order for over 1800 Street Lamps for the city of Para.

The Hartman Mfg. Company of Elwood City, Pa., manufacturers of Hartman Wire specialties, have recently made shipments of Fencing to France, South America and Japan. Last week this concern prepared two shipments, aggregating 5 tons of Wire, for export to Argentine Republic, South America.

The New Castle Galvanizing & Chemical Company, Newcastle, Pa., have been chartered, with a capital stock of $10,000. The directors are A. Johnston, D. R. Jenkins and H. Copewell, all of New Castle.

For the accommodation of their patrons in the East the Geuder & Paeschke Mfg. Company of Milwaukee, Wis., have established an agency with the Central Stamping Company of New York, for the sale and distribution of their Cream City Flour Bins and Sifters in the New England, Eastern and Southeastern States. The Central Stamping Company will carry a full stock of bins and all orders intrusted to them will be promptly filled.

S. B. Corby, 31 South Canal street, Chicago, Western manager for the Huyett & Smith Mfg. Company, issues a neat illustrated circular calling attention to the Smith Patent Ventilating Fan as a seasonable requirement with

the approach of the heated term. These Fans are furnished with and without electric motors.

FLASHINGS.

Geo. A. Katz, for a number of years with Edward Kirk, Jr., has purchased W. B. White's factory, 62 and 64 Pacific avenue, Chicago, and will continue manufacturing copper and galvanized iron cornices, skylights, tin, slate and iron roofing at the same place.

The American Roofing Company, St. Louis and Cincinnati, report their business for the month of May as being in excess of the corresponding month of last year. With factories located in both St. Louis and Cincinnati, they are in position to take advantage of any cut in freight rates either East or West. They advise us that their June business is excellent so far as it has gone, and they look for a continued good demand during the entire month.

The Knisely & Yeldham Company, 68 to 74 West Monroe street, Chicago, are to do the slating, galvanized iron cornices, gutters, &c., for the new school building, South Evanston. Also the slate roofing for the new building of the Famous Mfg. Company, East Chicago, Ind.

Shop Nomenclature.

Every trade is prone to develop a distinct dialect or set of technical terms and phrases—as a rule, most appropriate to its character but likewise almost unintelligible to the outsider. The machinist can talk a language that is no clearer to the uninitiated than that of the abstruse scientist, except, perhaps, because of a certain symbolic meaning to be found in many of the technical terms. In fact, one cannot fail to be impressed with this spirit of symbolism as he hears the familiar names of parts of the human body applied to inanimate tools and machines. The character and use of the lower portion of a machine is vividly presented to the mind when it is called a leg or a foot: the terms "body," "head" and "back," mechanically applied, are immediately clear to us, while there appears at once a fitness in the "arms" of a pulley, the "hands" of a watch or the "fingers" of a clutch. "Eyes" and "ears" are certainly suggestive terms when they refer to objects with which the machinist has to do, and so we find both similarity of form and use existing between the human jaw and teeth and the "jaw" of a vise or the "teeth" of a saw. Seemingly, having exhausted the body as a source, the versatile mechanic has turned to the clothing we wear. He can show one either a "shoe" or a "cap;" will place a "button" where it will do its duty as a knob or will hold two pieces together; he will even fit a "collar" or a "sleeve" over a shaft. All this in the way of curious terms and striking resemblances, but there is withal an important side to this matter of technology, or rather technical dialect. As it is well to-day that all men of science and letters can communicate through one language, the Latin (although it be dead to the world at large), so it is desirable that, at least within the limits of our own English tongue, there should be agreement among technologists, professors and artisans as regards technical terms and their definitions. For this dialect changes with the locality. Words that are familiar to us upon this side of the Atlantic are simply unintelligible to the English mechanic, and perhaps even more generally the reverse is the case. Thus the pitman of the Englishman or of our own old millwrights becomes the connecting rod of to-day and of this country. The punching bear is almost unknown to us by name, but the term screw punch is at once suggestive and explanatory of a common tool. The tap bolt of one locality is the cap screw of another, and so on. Mechanical and technical dictionaries of course serve to clear up some of the difficulties, but nothing is truer than that the lexicographer records but does not originate the terms or their definitions. In many a shop the origin of certain accepted titles can be traced back to the facetiousness of some workman who in the spirit of humorous comparison gave a symbolic name with such fitness that moral suasion could not overcome it. In fact, things must have a name, and if not well christened they are sure to be badly nicknamed. Indeed, it is common to find an article known by one name in the office and drafting room and by another entirely different in the shop. Thus the simple and explanatory title "bed" (of an engine) was found in one case to have been turned into "bullhead" by the molders, notwithstanding that there appeared neither symbolic nor sentimental reason therefor. The draftsman is often much troubled by this action on the part of the workmen. He gives his drawing a certain title or makes an itemized list of the parts, giving to each a name, but finds subsequently that his terms and titles when expressed in shop orders are not perfectly intelligible. His titles are likely to be long, but intentionally comprehensive, nevertheless his "regenerator spring rod clamp" is likely to be christened by the workman with a name perhaps less explanatory, but assuredly simpler and shorter. In this matter there should certainly exist the spirit of co-operation. There is no use in trying to make a bird sing that won't sing, and therefore there should be such agreement upon terms and titles that no misunderstanding can possibly arise.

Waste of Natural Gas.

Only the other day, in conversation with a well-known manufacturer, says a writer in the Pittsburgh *Dispatch*, I mentioned that the system of burning gas which he employed in his work was most extravagant and wasteful. I detailed to him some of the latest improvements which had come to my notice, when he turned around in his chair and remarked: "You don't seem to understand that we have our own well. What is the use of economizing? If we don't get the gas, Mr. —— will," mentioning the name of a gentleman who had wells close by him. Here was an instance of utter disregard for economy in the use of a good thing. It is so all over the country. Why, if all the gas burned and wasted in Pittsburgh were made out of oil, the entire output of the country would not produce it. There will have to be some material changes in the methods of burning gas before manufactured fuel can take the place of natural gas and make a profit for the gas companies. Theoretically, gas making is about perfect in its process, 90 per cent. of the coal being saved, but the most troublesome and as yet unsolved problem is how to handle it. If the supply required was always uniform there would be no trouble, but as the demand might fall from several million feet in the morning to several thousand feet in the afternoon, the gas maker who would supply the general trade has a problem which is indeed difficult to solve.

Vagaries of Weather.

A subject in which everybody is interested, without distinction of station or occupation, is *the weather*. Upon this, each day, all persons make some reflection. Like food, it is a fundamental factor of human existence, for even the supply of food is largely dependent upon its conditions. Thus it is that the weather reports and predictions now form an important and staple item of daily news. The uncertainties and vagaries of weather have become proverbial. Yet there is nothing more sure than that all its varieties, of which this country has had a rather unusual experience, result from the action of natural laws. As the word "law" implies regularity and uniformity in mode of action, and can mean nothing else, it has puzzled many to understand how such action can result in apparent irregularity. This spring we had first a continued period of dry weather, followed by heavy storms of wind with protracted rainfall, succeeded by late frosts, doing much damage to crops at various points. In these respects the season is regarded as exceptional, yet, in the action of natural laws how can uniformity permit exceptions?

A Puzzling Question Explained.

The answer to the question just put is that in nature all that seems irregular is only so in appearance. If one should trace with a pencil a mark say ½ inch long, making it as irregular as possible, and then exactly reproduce this mark, connecting it with the first, and so on with the third and fourth mark, that which at first seemed entirely irregular will soon appear to obey a law of uniformity. A regular recurrence of anything, considered as part of a whole, establishes a law of repetition. There are many reasons to believe that if observation of weather could be extended over sufficiently long periods a law of repetition could be deduced from systematic records of such observation. If such a law could be established, conditions of weather might be predicted with as great certainty as the return of a comet moving in a regular orbit. But it remains possible that such a law of recurrence, if it exist, may comprise cycles of time so great as to be comparable only with geological periods, lapses of time so vast that human records could not be preserved from their beginning to their termination. If this be true, while it does not conflict with the proposition that a law of uniformity governs weather, like everything else in nature, it implies that the law can never be definitely stated and will forever remain hidden from human intelligence.

The Anarchistic Strikers

Insurrections of more or less magnitude have broken out in 12 States. If they were due to political causes the whole country would be in a ferment. As they are merely demonstrations by striking workingmen, excitement runs high in the immediate localities affected and diminishes rapidly as the distance increases. Yet in nearly all these States it has been found necessary to call out the militia to check the commission of unlawful acts by bodies of men too large to be successfully handled by local authorities. The reports printed in the daily press read like bulletins from battle fields. Bloody engagements take place, lives are sacrificed, property is destroyed and the "horrid front" of war has become a vivid reality in too many places. Strikers defy the law and resort to the most desperate deeds of violence in a mad fury. They seem to have broken loose from all restraints and cannot be controlled by their leaders. These labor officials in their public utterances counsel peaceful methods, but they have evoked a demon who refuses to be confined and mocks their feeble efforts at restraint. In the wide organization of labor unions a new species of government has been formed, which is in direct antagonism to the form of government established by the people, and the conflict now precipitated must decide who shall hereafter be our rulers.

Enforcement of Law.

When the coal miners' strike began the sympathy of the public was overwhelmingly in their favor. The advantages of cheap fuel were scorned when it was found that such cheapness was the result of scanty wages paid to miners. Even coal operators themselves conceded the justice of miners' claims and professed their willingness to advance wages in quite a number of localities if competing operators would do the same. Enough of them at one time were ready to settle the dispute to have given the miners a great victory, which could then probably have been extended over the entire coal country. But the obstinacy of the leaders in refusing partial settlements and demanding a national adjustment changed the whole aspect of affairs. To hasten a coal famine desperate means were adopted by the miners. And now public sympathy has changed. The friends of the miners are deserting them. The press, without regard to politics, demands that the law shall be respected, that the movement of coal trains shall not be interfered with, that coal property shall not be destroyed, that miners who desire to work shall not be molested and that those who are in arms against the constituted authorities shall be treated as rebels. There is no longer any question of high or low wages for miners. The only question to be settled now is whether any body of men are to be permitted to establish a government of force in this land of liberty.

The Fire Island Light, one of the most important beacons on the coast, is about to be improved by the substitution of electricity for oil in its illumination. The new light that is to be installed is said to have the power of 25,000,000 candles. It was exhibited at the World's Fair, where it was known as the "lightning light." It has a bivalve lens. The two sides are about 9 feet in diameter. Each lens is made up of many crystal prisms set in a network of brass, the prisms concentrating the light on a crystal disk in the center. The lighthouse on Fire Island is 168 feet high, and it is estimated that the new light will be seen for 25 miles. It will be the greatest light on the coast of this continent.

In describing the present industrial situation in New England, the Boston *Transcript* says that a number of the mills are now being run not for the profit there is in the business nor simply to keep the men at work, but because the managers find there is a slight difference in expense account between running them at a loss and letting them remain idle. The manager of the Manchester Print Works, for example, believes in running the mills so long as the loss is less than 25 per cent. In other words, the expense of maintenance of idle mills is 25 per cent. of the actual cost of running, and as long as the loss in manufacturing goods falls below this 25 per cent. the mills will be run.

The Massachusetts Legislature has passed a bill authorizing the increase of the stock of the Bell Telephone Company to $50,000,000, with an amendment that the capital stock shall be paid for in cash.

THE LETTER BOX.

Marine Bicycle.

From R. B., *Lynn Valley, Ont.*—I am working on a water bicycle and have been referred to you for information about the valves. I intend having two tin tubes, tapering at both ends like a round bottom boat, with the top flat enough to fasten the boards to, for holding them together. The length of tubes is to be between 8 and 10 feet. The machine, 3 feet 6 inches in width, will be run by two paddle wheels, one ahead and the other in the center. I want the floats to hold from 200 to 225 pounds, to allow for the rider and the fixings. What should be the circumference of the floats?

Answer.—The floating part of the bicycle is in reality a catamaran, and we presume our correspondent expects to have the floats about half submerged. In other words, the two cylinders would then, if submerged half their depth, support the same quantity as one of the cylinders completely submerged. Assuming the length of cylinders to be 10 feet, and not making allowance for the taper of the ends, since we do not know exactly what the shape will be, it remains to find what diameter of cylinder 10 feet in length would hold 225 pounds of water. Consulting the tables, we find that a pipe 8¼ inches in diameter, 1 foot long, contains 23.1 pounds of water, so that a pipe 10 feet long contains 231 pounds of water. According to this figuring, therefore, if our correspondent makes his cylinders 8¼ inches in diameter and 10 feet long they will support 231 pounds when submerged half way. This, it must be remembered, makes no allowance for the weight of the cylinders, but we presume that was figured in the 225 pounds. It further assumes that the ends of the cylinders are square, so that it would be well to make the diameter a trifle larger to allow for the pointing at the end of the cylinders, if we are to assume that 10 feet is the length over all. If our correspondent is interested in figuring it out in another way it can be done in this fashion: A cubic foot of water weighs 62¼ pounds. Therefore he will have to displace 3.61 cubic feet of water to support 225 pounds. That assumes the length of the cylinder to be 10 feet totally submerged. For 1 foot of length, therefore, the cylinder will have to contain 0.361 cubic foot. We don't suppose our correspondent is specially interested in the successive steps of this calculation. Suffice it to say, therefore, that from these figures we deduce that a cylinder should be 8.14 inches in diameter to support the proposed weight. This is a little less than the 8¼ inches above given, but the latter figure, as stated, was for a weight of 231 pounds. We give the second calculation to show how it checked the first. We presume if our correspondent makes his cylinders 8¼ inches in diameter they will prove suitable for his purpose.

Proposed Package for Tin Plates.

From L. B. D., *Spring Hill, N. S.*—I notice in *The Metal Worker* of May 26 a communication from A. L. Burtis, Lockport, N. Y., relating to an improved package for tin plates. The idea of circular package is to my mind an improvement, but I fear that sheet iron for a covering is objectionable for the reason that a blow or fall upon the casing would dent it and leave an impression on the tin, which would thus be damaged. If the sheet iron casings were lined with wood of some light strong quality it would be better; or, why not have boxes similar to cheese boxes or something of that general kind? Then the box might be packed in the same way that zinc is packed in casks, the space being all utilized so that there would be no hollow core. I hope to see Mr. Burtis' plan for improved package carried out.

Steel Furnace Dome.

From R BIGLEY, 96 *Queen street, Toronto, Canada.*—Will *The Metal Worker* give me the address of some manufacturer of steel domes for hot air furnaces? I have looked for advertisements of these goods, but have found none.

Note.—We have given the full address of this correspondent in order that manufacturers of such goods may communicate direct. Hepe, Koven & Co., 18 Spruce street, New York, make a specialty of goods of this character.

Coppersmiths' Tools Wanted.

From JOHN FULLER, SR., *Seneca, Kan.*—Since my articles on coppersmithing appeared in *The Metal Worker*, and their republication in book form, I have received a number of letters from different parts of the country inquiring where the tools illustrated are made or can be bought. I have exhausted all the means at my command endeavoring to supply the information sought, but without success. Now, it would seem there is demand enough for these tools to warrant those manufacturing similar goods to make an effort to supply them, particularly hammers. I had a few brought from England a short time ago for my own use, because I could find none in America, but they were poor things, and not to be compared with those usually found in the old shops I have worked in. We ought to be able to get these things somewhere in America. If this should catch the eye of any one in the trade who can and will kindly give us the address of some maker or dealer in these tools, they would confer a great favor on many readers interested. It would be well, however, to say here that the ordinary method of making and hardening hammers is not suitable or satisfactory for braziers' or coppersmiths' tools. I mention this by way of caution, so that those who might be inclined to make an attempt may avoid failure at the outset and be reasonably successful from the beginning; ordinary tinners' tools, or tools made in the same way, are no use to us.

Boiler Surface and Radiation.

From C. W., *Paterson, N. J.*—Will *The Metal Worker* please inform me how many square feet of radiation can be carried by 1 square foot of heating surface in a horizontal tubular boiler?

Answer.—Our correspondent does not state whether the boiler is to be used for steam or hot water heating, and without more details only an approximation can be given. A conservative estimate that will probably give the desired information is that 1 square foot of boiler surface will carry from 8 to 12 square feet of hot water radiation and from 4 to 6 square feet of steam radiation. As a horizontal tubular boiler is generally considered a good type of boiler for heating, it is quite possible that it would carry the larger amount given.

Problem in Drainage.

From S. H., *Union Hill, N. J.*—In response to the query of "M. J. F." of Minersville, Pa., in *The Metal Worker* of June 9, in regard to the draining of his cellar into a creek, if the creek be a tidal stream I would suggest that he put in a back water valve, which would prevent the water from backing up at high tide and allow it to pass off at low tide. But if the creek be an inland stream, the rise of 2 feet which he mentions would no doubt be caused by the spring freshets and last some time, giving the water a chance to accumulate in the cellar. The valve alone therefore would not do. In that case he might put in an automatic cellar drainer, worked by water pressure, connecting the discharge from same on the further side of the back water valve. This would insure him a dry cellar. He certainly cannot depend on the velocity of the current to siphon out his cellar.

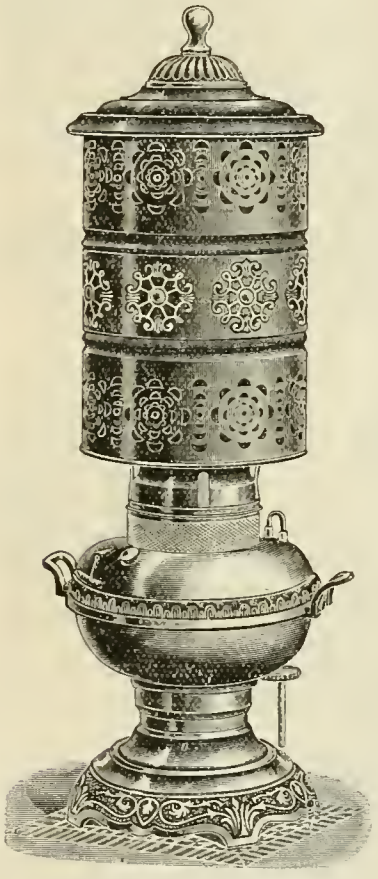
Capacity of Square Cans.

From J. H., *Baltimore, Md.*—Please inform me what size of square tin cans will it take to hold about 100 gallons each? They are to put in a wagon about 4 feet wide, and I would not want them more than 2 feet high.

Answer.—Starting with the basis of 2 feet hight, the size of the cans to hold exactly 100 gallons would be 31.02 inches on the side. Cans 31¼ inches square and 2 feet high will hold 101.4 gallons, which will probably be near enough for our correspondent's purpose.

New Process Oil Heater.

The Standard Lighting Company of Cleveland, Ohio, have placed upon the market a heater known as the New Process, and intended for burning coal oil as a fuel. It is constructed with a brass font, nickel trimmed, and a Russia iron drum with ornamental top, which can be removed in order to use the grate for cooking purposes. The accompanying illustration represents a general view of the heater with the top in position. The manufacturers refer to the



New Process Oil Heater.

construction of parts as simple and as easy to keep clean. The company make use of their Mammoth Globe incandescent lamp with a special attachment on the spreader, which, with the drum, can be readily removed, the spreader changed, a glass chimney placed in position and the heater is at once converted into a 300 candle power Globe incandescent lamp. This heater is intended more especially for use in bedrooms, bathrooms, offices and other places where a moderate heat is required without a flue connection.

The Cowper-Coles Cold Galvanizing Process.

The electro deposition of zinc has been the subject of many patents, but the process was found to be too slow and costly, and the deposit obtained porous. Mr. Cowper-Coles claims that his method of deposition entirely overcomes these difficulties. The engravings, which are from the *Engineer* of London, show the arrangement of a plant recently erected by Watson, Laidlaw & Co., at Glasgow. The articles to be zincked, if thickly coated with grease, are passed through the "potash boil," which is kept at a temperature of about 200° F. by means of a copper steam coil, the solution consisting of 1 pound of American potash to the gallon of water. The articles are then placed in the pickling tank, which contains a weak solution of sulphuric acid and water, kept circulating by a steam jacketed pipe outside the tank, as shown on the plan. The articles are then placed in the washing tank and allowed to remain there until they are required for zincking.

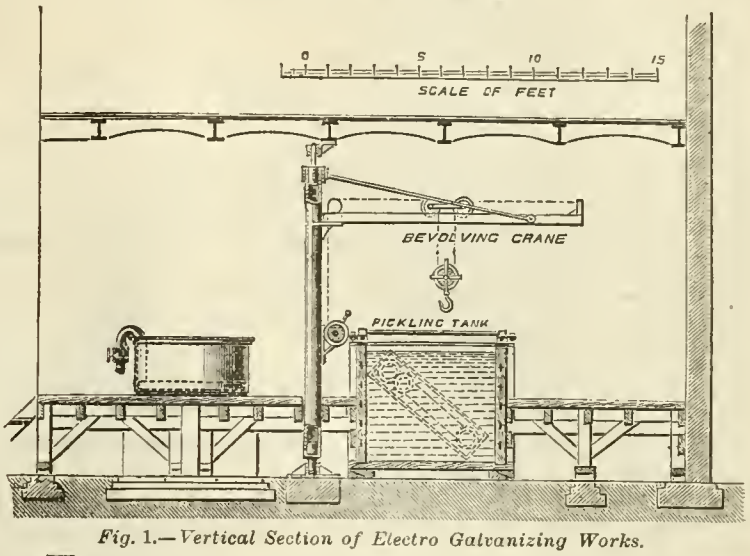


Fig. 1.—Vertical Section of Electro Galvanizing Works.

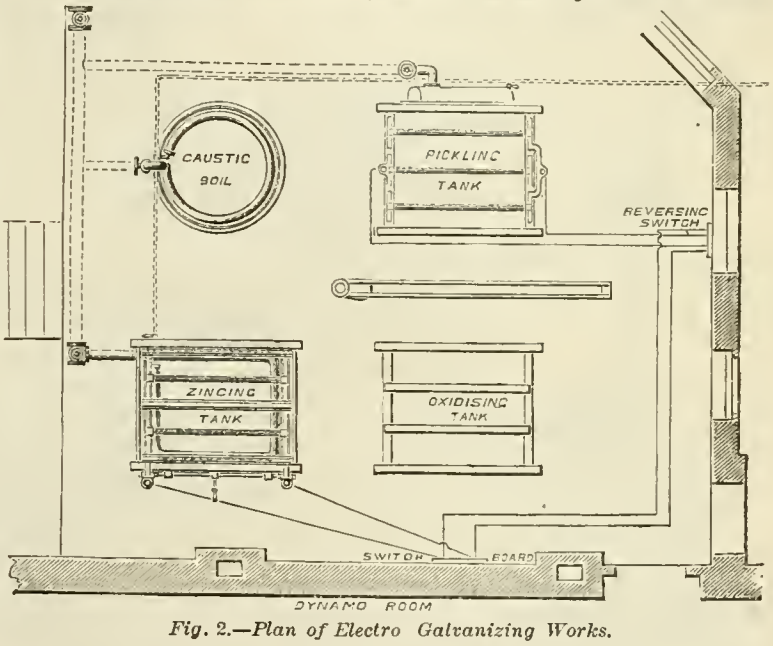

Fig. 2.—Plan of Electro Galvanizing Works.

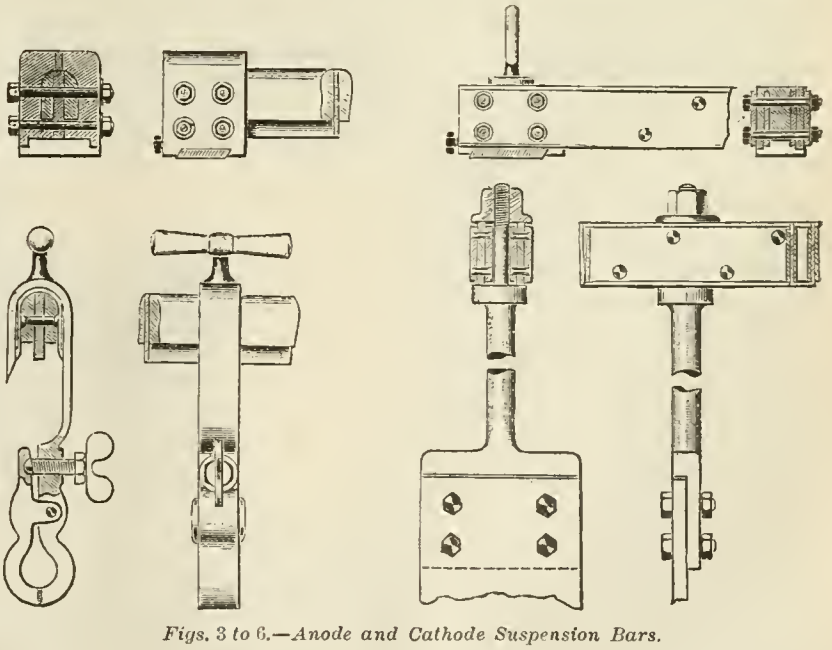


Figs. 3 to 6.—Anode and Cathode Suspension Bars.

THE COWPER-COLES COLD GALVANIZING PROCESS.

Figs. 3 to 6 illustrate the arrangements of the anode and cathode suspension bars, which are designed to carry 800 ampères each, the total output of

the dynamo being 2500 at 5 volts. A current density of 50 ampères per square foot is employed at the electrodes. The current is conveyed from the dynamo to the zincking bath by two cotton covered cables, having a total sectional area of 2½ inches. Each cable contains 16,800 No. 33 S.W.G. wires made up into 20 strands. The cathodes —that is, the articles being zincked—are suspended on compound copper and steel suspension bars, which rest on a rocking frame to which is imparted a horizontal and vertical motion by means of a hand lever and roller paths, as shown below; the roller paths have a rise of 1 inch in 3 inches. The structure of the compound conductor suspending bars is shown clearly in Figs. 3 to 6 above, and the arrangements for connecting up and for limiting the rocking are shown below. One of the special features of Cowper-Coles' process is the addition of zinc fume or powder to the electrolyte. The zinc dust is readily kept in suspension, as the solution employed is very dense. The addition of the zinc fume enables more than the theoretical deposit to be obtained under favorable conditions, and overcomes almost all the difficulties appertaining to the electro deposition of zinc. The zinc powder employed is obtained direct by the process of distillation from the ore.

The thickness of the zinc cost, says *Industries* of London, applied by dipping the articles to be galvanized in a bath of molten zinc can be varied only within very narrow limits, except in the case of thin plates, which can have the excess of zinc squeezed off by rollers when leaving the bath. The cold galvanizing process allows of the thickness of zinc coat being readily varied from a few grains per square foot to 1½ ounces, which is a matter of some importance, as for many classes of work it is not desirable to have more than ½ ounce of zinc to the square foot. Another advantage of the cold process is that a much smoother surface and a more equal distribution of the zinc is obtained than is possible by the ordinary hot galvanizing. This renders the new process especially suitable for coating the plates of the hulls of fast vessels, such as torpedo boat destroyers. As pointed out by Sir Gabriel Stokes, in addition to the element of resistance depending on the formation of waves continually propagated away from the ship, there is the effect of retardation due to the roughness of a ship's bottom out of all proportions to the mere increase of virtual dimensions, which is explained by the consideration that the little roughnesses form the birthplace of eddies.

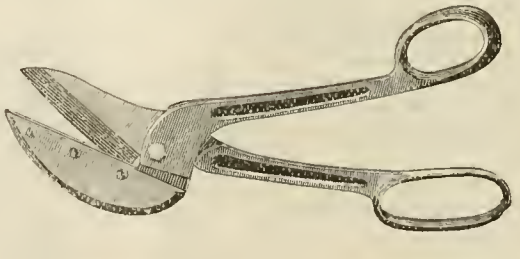
The time in the zinc plating bath is as follows :

Table of Time.

Weight of zinc required.		Thickness of coating.	Time of immersion in bath.
Per superficial foot.	Per superficial yard.		
Ounces.	Ounces.	Inch.	Minutes.
½	4½	0.000861	5
¾	6¾	0.001291	7
1	9	0.001722	8
1¼	11¼	0.002152	10
1½	13½	0.002583	13
1¾	15¾	0.003013	17
2	18	0.003444	20

The Lobl Tinners' Shears.

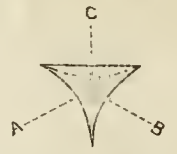
We show in the accompanying illustration a general view of the Lobl shears, a tool intended for roofers, tinners, cornice makers, &c., and made by Eugene Kulinski & Co., 91-93 Thompson street, New York. The peculiar shape of the blades will be noticed, and the special feature of the shears is the method of pivoting them, so that a slot permits the metal to be run straight back as it is cut, and thus the metal does not require straightening after cutting. It is further pointed out that these shears will cut corner shaped strips or leaders, &c., of metal as heavy as No. 24 iron or soft steel. The shears are made of steel throughout, with removable blades, so that they are easily sharpened. The Lobl shears are made in two sizes, No. 14 being 14 inches long, with jaws 4 inches in length, and weighs 2 pounds. No. 2 is 15½ inches long, 4½-inch jaws and 2½ pounds in weight.



The Lobl Tinners' Shears.

Molders' Leather Fillet.

The engraving here presented represents a new form of leather fillet made by the Diamond Clamp & Flask Works of Richmond, Ind. The sides of A B are cut curving, as shown, instead of straight. When the point at the intersection of the lines A B is forced into a square corner the side C assumes a curve, as indicated by the dotted line. This construction saves the time of cutting and preserves the surface of the leather, the exposed side C being the hair side.



Molders' Leather Fillet.

Because some imported Italian marble mantelpieces had been received for the new mansion of Elbridge T. Gerry in this city, all the workmen employed in the building, including plasterers, carpenters, plumbers, tile layers, electric wire men and iron workers, quit work recently, by order of the Building Trades Union. The unreasonable tyranny of organized labor was never more strikingly exemplified. More than $10,000 have been already paid to American workmen employed on the building for interior decorations alone. The union puts its case on the ground of objection to "the use of the products of foreign labor," and the Gerry house has been selected as a test case.

The New York and New Jersey Bridge bill was signed by the President on June 8.

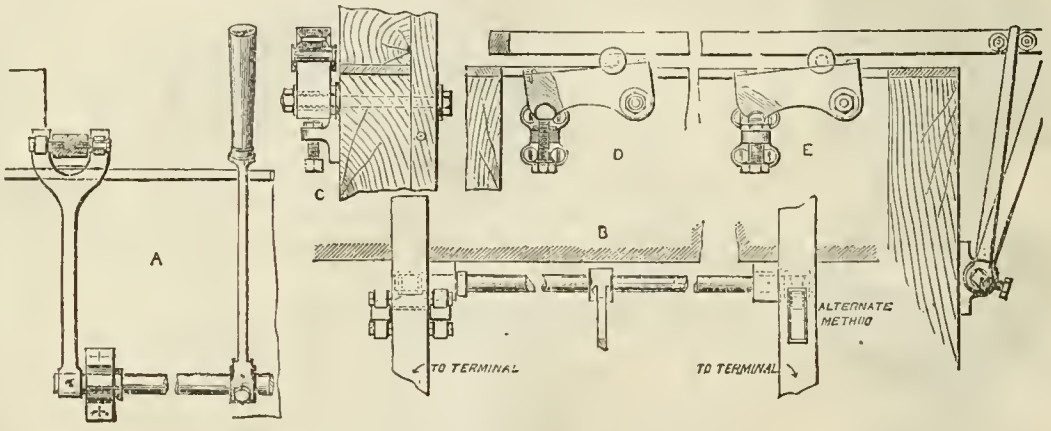


Fig. 7.—Cathode Bar Suspenders and Rocking Frame.

THE COWPER-COLES COLD GALVANIZING PROCESS.

THE RETAIL STORE.

The Dempsey Cutlery Display Case.

The Union Show Case Company, 167 and 169 Randolph street, Chicago, Ill., are manufacturing and placing on the market the Dempsey patent cutlery display cases. These cases contain many features which are unique, novel and withal intensely practical, as shown in the accompanying cuts. The design of the case, the inventor states, is to furnish the trade with a case that meets all requirements with no disadvantages. As seen in Fig. 1, pocket knives to be displayed are arranged in parallel corrugations at an angle of 30° and in three separate horizontal tiers rising one above the other. The larger patterns occupy the base or lower tier, while the smaller and more expensive are placed in the second and third tiers. Rising above the third tier at an angle of 10° and running parallel with the lower tiers is a board for razors, shears or scissors. The background is of blue, red, green or old gold plush. To add still further to the embellishments as well as conveniences, below each tier of patterns displayed and running horizontally is a strip of burnished and lacquered brass, perforated in such a manner as to hold tags on which are printed the number and price of the article immediately above. These price tags are easily detached and can be quickly changed so as to meet all the conditions of the trade. By means of these tags the attention of the purchaser is called not only to an array of glittering blades and handles in a general way, but his attention is directed to individual and particular patterns. They also enable cutlery to be easily marked without marring or soiling.

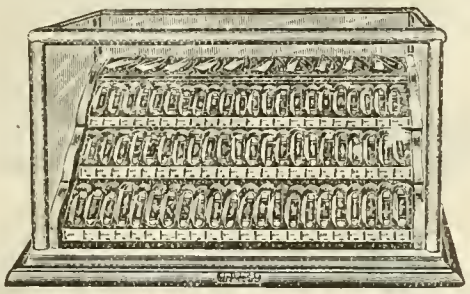

Fig. 1.—The Dempsey Cutlery Display Case.

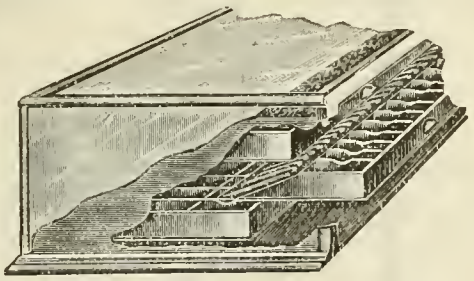

Fig. 2.—Sectional View of the Dempsey Case.

The internal construction of the case will be understood by reference to Fig. 2, which gives a sectional view. Each display tier has compartments for stock which are concealed from view in front, but can be drawn out in the rear like a drawer. By this arrangement the capacity of the case is exactly double that of an ordinary show case. A case 30 inches long carries the stock and displays 66 patterns of pocket knives and one dozen patterns of razors, shears or scissors. The display boards, as seen on the front of the case in Fig. 1, are detachable and may be placed on top of the counter or show case, as shown in Fig. 3, for the closer inspection of the customer. When stock is low, by placing two or more of each kind of knives on the display rack the stock can be made to appear to the purchaser to be quite large, while, on the other hand, if the stock is very large and the dealer is crowded for space it can be contracted by displaying only one of each pattern. Another feature of this case which recommends it to the trade is the fact that it is practically impossible for careless clerks to disarrange the display, or for it ever to appear otherwise than in the best possible condition. Although this case was only patented October 3, 1893, it has been adopted by leading jobbers of cutlery throughout the entire country.

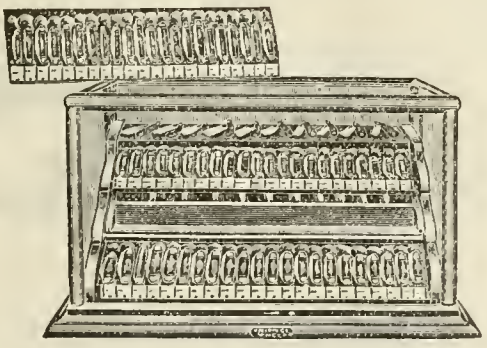

Fig. 3.—Detachable Display Boards.

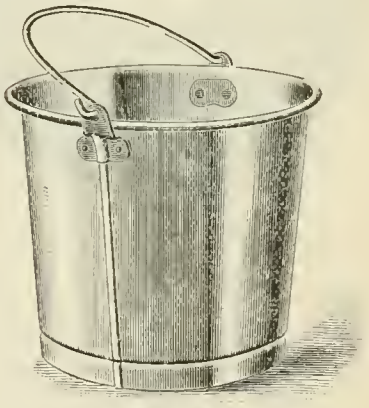
A New Dairy Pail.

We show in the accompanying illustrations a general view, Fig. 1, of a new dairy pail brought out by the Rochester Stamping Works, Rochester, N. Y.; also, Fig. 2, section through bale ear. The patented feature of the pail is the reinforcement of the ear, as shown in Fig. 2, which consists of a small piece of tin set into a countersink on the inside of the pail directly behind the ear, and all firmly riveted together and securely soldered on the inside, making in



New Dairy Pail.—Fig. 1.—General View of Pail.

Fig. 2.—Section through Ear.

this way an extra strong attachment, perfectly water tight. It is furthermore pointed out that it is impossible for the rivets to work loose or rust out. The patent covering this feature was granted to M. F. Robeson May 15 of this year. The special points of superiority claimed for this pail by the manufacturers are extra heavy wire around the top edge, heavy ears of steel and reinforcement of the ears by extra piece of metal countersunk as described. We understand that these goods are meeting with much success with the trade.

The Ideal Damper.

Stover Mfg. Company, Freeport, Ill., have just taken up the manufacture of dampers, and are introducing the one

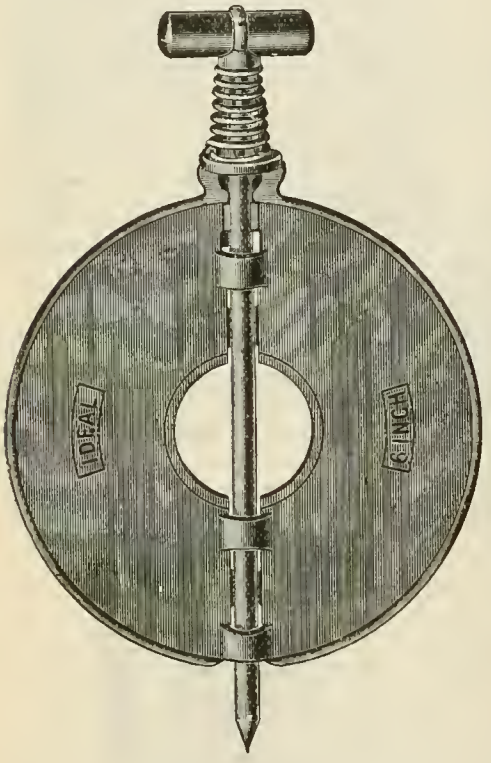


Fig. 1.—The Ideal Damper.

Fig. 2.—Damper Spindle.

shown in the accompanying cut. It is explained that the spindle goes in straight, having proper guides, so that it cannot go wrong, and that with a quarter turn it is in place; that the collar is secured to lugs on the spindle, so it cannot slide off when the spindle is taken from the blade, thus saving much annoyance, and that the wooden handle is securely held in place by means of a wire wrapped around the center in a groove, one end of the wire being cast into the head of the spindle, thus becoming a part of it. The point is made that there is a small amount of metal about the handle, and that the handle is securely held and is kept cool. The makers claim that the spindle is sharp pointed and makes its own hole; that the spring and collar are securely attached to the spindle; that no punch or tools are required to put it in place; that it requires but a quarter turn of the spindle to lock or unlock it; that the spindle enters the blade with the handle turned either way, and that the locking lugs on the spindle are sharp and cut their way through the pipe. The dampers are made in regular sizes from 4 to 7 inches.

Great American Fish Scaler.

Covert's Saddlery Works, Farmer, N. Y., are offering a fish scaler, as shown herewith. The scaler is made of heavy

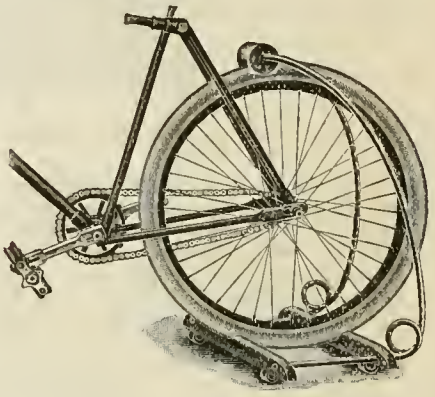
Great American Fish Scaler.

sheet steel, attached to a steel shank, and is nicely finished by being C plated with a non-corrosive metal; it weighs about 3 ounces. The point is made that the rapidity and ease with which scales can be removed with the tool make it a very desirable device for the fish market and the family. Samples are sent by the makers by mail upon receipt of 15 cents.

THE JOHN TOBIN MFG. COMPANY, Newark, N. J., are just sending out a 56-page catalogue the front cover of which proclaims them as manufacturers of nickeled and copper urns, planished tin, copper and nickel plated tea and coffee pots, spun goods and sheet metal specialties. A note to the trade states "we are direct producers of every article in this list" and that "several new and useful articles have been added to our assortment." Several pages are devoted to urns, which are made either porcelain or tin lined and in various sizes and shapes or to special order. These are followed by planished soup tureens, farina and rice boilers, tea kettles, chafing dishes and nickeled and copper beer and ale measures, funnels and mixers. Then several pages are devoted to coffee and tea pots and urns, among which are the Best, with textile filter; the Aroma, Superior and Boss, and Boss urns. These are followed by butter kettles, jelly molds, saucepans, dippers, coffee flasks, gravy strainers and brass, copper, tin and zinc oilers. They also make a line of trimmings, breasts, covers, handles and spouts of tin and copper for tea and coffee pots, and a line of animal, leaf and other cake and biscuit cutters.

The Bridgeport Bicycle Stand.

Lyon & Grumman, Bridgeport, Conn., are putting on the market a bicycle stand, as here shown. The device consists of two cross bars of wood, which may lie flat on the floor or be mounted on casters, through which run ⅜-inch steel wire. This is coiled to form a spring and then carried up to the hight of the bicycle wheel and across and down on the other side. The bottom of the wheel rests in grooves in the wood cross pieces and the top is held by a grooved spool through which the wire runs. This arrangement, it is stated, holds the bicycle upright and firm even when mounted, and permits



The Bridgeport Bicycle Stand.

easy movement of the machine either together with the stand or alone. The manufacturers claim that the stand is simple in construction, manufactured in the best manner and that it weighs but 4 pounds.

Improved Sad Iron Handle.

The Cleveland Wood Turning Company, 710 to 726 Scranton avenue, Cleveland, Ohio, are manufacturing an improved Mrs. Potts' sad iron handle. The improvement relates to the metallic part of the handle which is called the stretcher. This is now made of steel, nickel plated or tinned, instead of cast iron. It combines lightness and strength without the breakage attend-

Improved Sad Iron Handle.

ing the iron stretcher handles. The ends of the stretcher are turned up, as shown in the illustration herewith, for the same reason that the iron stretcher has hollow lugs at each end—namely, to keep the screw heads as far as possible from the hot iron, and thus avoid unduly scorching or burning the wood. The wooden circles used in the manufacture of these handles are of exactly the same dimensions as used on the regularly made handles, but are only of hazel.

PLUMBING and GAS FITTING.

Illinois State Convention.

The first annual convention of the Illinois Master Plumbers' Association was held in Peoria June 7. W. T. Geary of Chicago, State vice-president of the National Association, opened the meeting. An address of welcome was delivered by Mayor Miles. The following officers appointed at the May session in Chicago were in attendance: Robert Loudon, president, Bloomington; W. T. Geary, vice-president, Chicago; J. R. Scanlon, treasurer, Elgin; B. B. Breen, secretary, Chicago. Executive Committee: Robert Loudon, Bloomington; J. R. Scanlon, Elgin; W. E. Goodman, South Evanston; William H. Durham, Rockford; David Whiteford, Chicago; T. P. Cullon, Chicago; P. Sanders, Chicago; W. T. Geary, Chicago; A. W. Murray, Chicago. The purpose of the meeting was to form a more perfect organization for the advancement of the plumbing business of the State and to procure, if possible, proper legislation leading to more perfect sanitary plumbing and a better class of work throughout the State. The association proposes to do this and asks for the appointment of inspectors for towns having water and sewerage systems and if possible for the examination by a competent board of applicants for plumbing licenses.

Entertainment at Detroit.

The Master Plumbers' Association of Detroit, Mich., held a meeting at the Builders and Traders' Exchange rooms last week, at which the programme for the annual convention of the National Master Plumbers' Association was adopted. The convention will be held in Detroit on Tuesday, Wednesday and Thursday, June 19, 20 and 21, and between 500 and 600 delegates, including the members of the local association, will attend.

There are 60 members in the city who, together with the delegates from the State, will form the Michigan delegation of about 100 men. They will meet at the Builders and Traders' Exchange on Tuesday, June 19, at 9 a.m. All will wear a uniform consisting of white Fedora hats, black suits and canes. Headed by a band, they will march to the Hotel Cadillac, where all the delegates from outside of the State will be assembled, having been escorted thither from the depots and other hotels by a committee.

Colonel McGurrin of Grand Rapids, chief marshal, and Colonel Wheeler of Kalamazoo, his aide, will take charge of the parade, which will move as follows: From the Cadillac Hotel down Michigan avenue to Woodward avenue, around the Campus Martius, back to Michigan avenue, and up Lafayette avenue to Philharmonic Hall, where the business session will be held.

Tuesday night the delegates will be given a moonlight excursion up and down the river on the new steamer "Pleasure."

While the delegates talk business on Wednesday afternoon, the lady guests will be given a ride around the city. At 4 p.m. all the gentlemen and ladies will be taken to Alexander's, above Walkerville, by steamer. After supper they will be given a short ride on the river and then return to the city.

The business sessions will close some time on Thursday evening. During the afternoon the lady visitors will be given another carriage ride around the city and to Belle Isle. On Friday morning at 8 o'clock the steamer "Pleasure" will leave the foot of Woodward avenue with all the delegates and their ladies on board and steam up to the Oakland on the St. Clair River, where dinner will be served. The party will return to Detroit at 6 p m.

James H. Crumley is president and Thomas F. Morris secretary of the local association. The entire association constitutes the Reception Committee, of which George Lane is chairman. The Committee of Arrangements consists of James Meathe, president of the State association; James W. Partlan and Benjamin Guiney. Benjamin F. Guiney will act as general utility man.

The Plumber of To-day.

The following is the address made by Zalmon Goodsell at the banquet tendered by S. E. Dibble to the New Haven, Conn., Master Plumbers' Association on retiring from the presidency:

During the past six years, a new order of things has come to pass. We formerly found that competition with the manufacturer and wholesale dealer was an impossibility; combination and organization were necessary before our just claims would be considered or listened to. The call was responded to by members of our trade joining from all over the country. The sequel has been wonderful in its far reaching results. To day, after six years of labor, we have local and State organizations everywhere. We have rights granted that we never dreamed of or dared ask for before. To-day, instead of botchy and slighted work being common, it is very uncommon Better work is done, more care is taken. The honor of our association is at stake. No member wants the reputation of doing an injury to his neighbor or to himself. To-day the industrious and ambitious plumber and apprentice are striving to be better educated and better acquainted with their adopted profession, hoping some day they may be able to have a business of their own and be competent to take charge of the same.

To day we are expected to know all about hydraulics, boilers, engines, pumps and connections and their uses; about gas fitting, steam heating, furnaces, stoves, tinning, drafting, shop work, sanitation, ventilation, drainage and many other branches of knowledge that enter into the construction of a building, from the smallest cottage to the largest edifice. To day there are thousands of goods of different varieties and sizes, of every conceivable shape manufactured for our use, giving employment and support to hundreds and thousands of men all over the country. How many of these working people would be homeless and in want if it were not for the thrift and enterprise of the plumbing trade that keeps them employed? To-day the different trades in unison, by furnishing employment to the skilled mechanic and the laboring people, enable them to build their homes, support and raise their families in comfort. This increases the population and wealth of all towns and cities. This fact proves that the trades lay the foundations of progress for all municipalities. To day we must for the good of our cause go forward, not backward. Our status will be made stronger; then new impulses will secure desired legislation for the protection of human life and more perfect work. Can we trust this duty to strangers that are not educated in our trades, or shall we by organization and devotion to our needs spare a part of our own time from business pursuits to certain public duties?

To day our trade does not hear the expressions and receive the unseemly ridicule from others nearly so much as formerly. We are deserving of more respect, and why should not this be so? None but the brightest minds can ever hope to half understand the large variety of knowledge and skill required to make a good workman and a competent master. Our practical experience, instead of theoretical, gained by years of time and application, demands superior intelligence to learn the trade's intricate requirements. To-day we are the equal of any profession. We hear words of wisdom at our different gatherings, of prominent members who a few years since did not know the latent powers of thought and speech they were endowed with, until the opportunity arose that developed their minds. Knowledge of our work is never ending, it will be continuous as long as the genius of man exists. To-day we have good fellowship and harmony among the craft instead of dickerings, bickerings and jealousy. We meet with one common interest, knowing by all experience that what benefits one member benefits all alike. To-day, would any member dare place himself on record as desiring to have the leaves in our book of progress torn out and go back to the old methods, of every man for himself, when the combined intellect of our members has brought forth so many new and needed inventions for the convenience and health of the people?

For six years we have been talking and telling over the same old story, of our hopes and fears, of our ambitions, singly and collectively, of how near to accomplishment we have come to their realization. To some this may seem dull music; still we should be more than willing to bear up under the old strains, as all objects desired are gained by persistency, and perfectness by continued repetition and practice. We cannot bring forth new thoughts and ideas without re-examinations of the old familiar ones. We each have our mission in life to fill, every one in his own peculiar sphere. Some will by

their energy make their years spent upon earth of great benefit to mankind, by being broad minded, charitable and helpful to their fellow beings. Others may come and go having gained a bare subsistence. They live in an atmosphere of egotism and small surroundings. They may have done some good and more of evil. These constitute a large majority of the atoms of humanity among the millions that inhabit this earth. We pray the time may come when every human being will be counted on the side of well doing. Let every person try to do one thing perfectly, have some object in life before death comes. A record of success in life's struggles lives after you are gone, and you will not have lived in vain.

Gas and Gas Fitting.—I.*

BY J. W. HUGHES.

Introductory.

It is my intention to write, under the title "Gas and Gas Fitting," a series of articles for *The Metal Worker* suitable to the requirements and understanding of the ordinary reader. It is my special desire to make the articles of use to those who may be called upon, from time to time, to execute in a practical way such work as may come to hand in the usual course of a small plumbing and gas fitting business conducted in a large city, or in the general tinsmithing, plumbing and gas fitting shop of the smaller towns. Little that is new will be advanced, and anything in the way of the higher science of the subject will be avoided. The first, because anything new on the subject of ordinary illuminating gas, speaking in a general way, is exceedingly hard to find; and secondly, because the higher scientific side of the question would, I take it, be of little practical interest to my readers. My authorities will be the encyclopedias, mechanical dictionaries and facts gleaned from writers of authority, supplemented by information gathered from practical gas fitters, whose life work has been the fitting up of the various pipes and fixtures. Finally, such knowledge on the subject as some 30 years' general practice in the art has given me, is at the disposal of the reader, provided I have the skill to put it within his reach.

When the ordinary person hears gas spoken of the conclusion is immediately come to that lighting gas is the subject under discussion. But the word "gas" covers a larger field. An old dictionary explains the word as follows: "Gas—a spirit not capable of being coagulated, the essential spirit into which all matter is resolvable; an inflammable vapor, which is obtainable from combustibles, and is used for lighting up; also obtainable by decomposition for all things, more or less." Rather a quaint definition, but in the main correct enough to suit the present purpose. The "obtainable from combustiblea" and "is used for lighting up" (part of the above quotation) is what is of particular interest in the present case. Such a person will also have in his mind the idea that gas is quite a modern discovery or invention. He is aware that the grandfathers of the present generation of mature years used whale oil and tallow candles when they did any lighting up. But there is nothing new under the sun, and natural gas has been used from remote times in China, Central Asia and near the Caspian Sea for purposes of heating, lighting and manufacture. It is undoubtedly true, furthermore, that the sacred and perpetual fires that received the adoration and worship of that very ancient religious sect, the Fire Worshippers, were gas fires fed by natural gas issuing from fissures in the earth.

The general introduction of gas as a lighting material is undoubtedly of modern origin. About 1786 Earl Dundonald made experiments on gas lighting at Culross Abbey, his search, however, not being for light but for the tar that resulted from the distillation of coal. The gas in the noble Earl's works was a by-product, being regarded as a very interesting curiosity. In modern gas works it is the gas that is sought for (the tar being one of the by-products), although the by-products of an up-to-date gas plant, consisting of coke, tar, ammonia, analine dyes, &c., &c., are more valuable than the gas. In fact, I have authority for saying that though not a foot of gas was used for ordinary lighting and heating purposes, the distillation of coal would still be a very profitable industry.

In 1792 William Murdock lighted his shop at Redruth, Cornwall, with coal gas. He afterward fitted up a more extensive plant near Birmingham, England, for lighting the workshops of the celebrated firm of Boulton & Watt, engine builders, and about 1803 he fitted up several cotton mills in Manchester. To him is generally given the credit of being the discoverer and introducer in a practical way of modern gas lighting, and not without right. However, as far back as 1667 the "Transactions" of the Royal Society gave an account of a burning spring in one of the coal districts of England, and alluded to the fact that Thomas Shirley traced its source to gas escaping from the underlying coal beds. It is not necessary to go further into the history of gas, but it is to be hoped that enough has been put before the reader to awaken an interest in the subject and prompt the reading necessary to fuller information.

Coal gas, which is most commonly and generally used through the world for lighting, heating and cooking, is obtained by a simple process of distillation, bituminous coals being selected as most likely to give the best results, although cannel coal holds a high place in the opinion of gas engineers.

* Copyrighted, 1894, by David Williams.

Banqueted by S. E. Dibble.

At the eleventh annual meeting of the Master Plumbers' Association of New Haven, Conn., after the report of the president, S. E. Dibble, which was the feature of the meeting, the following officers were elected. In spite of the efforts of the members to the contrary, Mr. Dibble insisted on the election of some other president, he having served four years. The officers for the ensuing year are: President, Franklin A. Curtiss; first vice-president, Edward A. Rourke; second vice president, Andrew J. Clerkin; recording and financial secretary, James M. English; corresponding secretary, F. A. Carleton; treasurer, W. H. Hazel; sergeant-at-arms, T. W. Corbett.

The delegates to the national convention at Detroit are: President Curtiss, A. J. Clerkin and S. E. Dibble.

The meeting adjourned to a banquet tendered by Mr. Dibble, served at the Republican League House, to which several guests from out of the city were invited. At a handsomely decorated table, with music by an orchestra, the following *menu* received universal attention:

Clams on Half Shell,
Sherry.
Consommé Puritanière,
Boiled Halibut, Hollandaise Sauce,
Sauterne.
Parisienne Potatoes,
Sliced Cucumbers,
Roast Spring Lamb, Mint Sauce,
Champagne.
Peas, Potatoes, Asparagus,
Lettuce, Tomatoes,
Chicken Salad.
Ice Cream
Assorted Cakes, Crackers and Cheese,
Fruit, Coffee, Cigars.

When the cigars made their appearance and the clouds of smoke put every one in a good humor, Mr. Dibble rose, but before he had time to speak A. J. Clerkin surprised him by the presentation of a magnificent gold watch chain with a diamond studded locket inscribed as follows: "Presented to S. E. Dibble, President, by the Members of the New Haven Association of Master Plumbers, June 5, 1894." Mr. Clerkin prefaced the gift by a few well worded remarks, paying a fitting tribute to Mr. Dibble's long and faithful tenure of office.

Mr. Dibble was taken completely by surprise, but thanked the association in a heartfelt manner. Among the other speakers were Jas. Ahern, J. B. Weiant, C. S. Eames, Zalmon Goodsell, who was introduced as the plumbers' candidate for Governor; John S. Craig and Robert Morgan. Elmore Dibble, the son of the host, gave a violin solo, and James Ahern sang "The Sword of Bunker Hill" as only he can sing it. Plumbing Inspector John D. Eldridge and Fire Commissioner W. H. MacDonald also made short addresses, when the gathering dispersed with pleasant thoughts of Mr. Dibble as an official and a host.

The following were present at the banquet: James Ahern of Hartford; A. J. Clerkin, J. B. Weiant of New Britain; John S. Craig of Hartford, and C. S. Eames of Bridgeport, officers of the State Association of Master Plumbers; Zalmon Goodsell of Bridgeport; S. W. Damon of New Britain; Robert Morgan, F. A. Curtiss, J. Newton Pierpont, J. H. Buckley, W. H. Hazel, F. A. Carleton, J. D Eldridge, James E. Howland, Edw. A. Rourke, Thos. P. Rourke, Wm. Keane, T. W. Corbett, Jas. M. English, Wm. H. MacDonald, T. A. Potter, Thos. Gunning, D. E. McNamara, E. N. Botsford, A. B. Sproul, W. F. Redfield and Willard C. Warren.

TRAPS AND VENTS.

AT THE FINAL MEETING of the delegation from the New York City Association of Master Plumbers to the national convention at Detroit, it was unanimously resolved "to present the name of and support Vice-President Mitchell of New York as our candidate for president of the National Association for the coming year." The meeting was well attended, 28 out of the 37 delegates being present. In reference to the matter of his nomination, Mr. Mitchell said: "Should the association confer on me the honor of the presidency I shall endeavor to advance its standard for usefulness in the interest of all; should some other man receive the honor, I shall congratulate him and feel that I have been relieved of a great responsibility and will render him such assistance as is due from a loyal member." Mr. Mitchell has always been an active man in the affairs of the association, and his work during the past year

has reflected much credit upon his executive ability and untiring energy in forwarding the interests of the master plumbers.

The Master Plumbers' Association of Lynn, Mass., organized through the influence of National President Daniel G. Finnerty, is composed of the following members: L. A. May Company, F. R. Niles & Co., Geo. E. Sleeper & Co., John F. Morgan & Son, John Hunt, John H. Pension, Joseph McGilvary, M. B. McLaughlin, Jas. R. Hughes, Pote & Upton, Talbot & Co., Harnwer & Quimby, Myles F. Moran, T. B. Reardon, W. I. Wiley, Jas. H. Curry, W. E. Lewis, Jas. F. Ryan, John Gard, R D. Potter. They have affiliated with the National Association and have elected the following officers: President, J. F. Morgan; secretary, Edward M. Russell; treasurer, J. C. Donnelly.

It is gratifying to know the strict way in which the law concerning unlicensed master plumbers is being enforced in this city. We have already called attention to instances of fines for violations of it, and this week another plumber without a license was fined $25 in the Court of Special Sessions for doing an overhauling job.

Through the kindness of the president of the National Association of Master Plumbers, Daniel G. Finnerty of Boston, we are in possession of a copy of the law recently passed in Massachusetts relative to the licensing of plumbers and the supervision of the business of plumbing.

J. W. Petry & Co. are a new firm in the plumbing and heating business at Fourth and Verona streets, Long Island City, N. Y.

A sarcastic writer in one of the Albany, N. Y., daily papers asks: "Can any one tell me why all plumbers use for a sign a water closet bowl? It certainly is not a pleasant object to see stuck in two or three windows, or worse yet, outside, on every street. There is nothing attractive about it—in such a position, at least."

The difference between the master and journeymen plumbers at Jacksonville, Fla., has been adjusted and $3 will now be the pay and nine hours will constitute a working day.

The Master Plumbers' Association, formed last month at Lowell, Mass., through the efforts of National President Daniel G. Finnerty, composed of the following members, has affiliated with the National Association: H. H. Wilder, T. Costello & Co., S. H. Jones, H. R. Barker Mfg. Company, Farrell & Conaton, D. H. Wilson & Co., Drury & Green, James McLarney, J. W. Stewart, Scott & O'Day, Aaron C. Ladd, Jno. H. Barry, Ezra A. Nichols, Jas. Caddell, Wm. F. Enright. The following delegates were elected to attend the national convention: T. Costello, S. H. Jones, P. F. Conaton, D. H. Wilson.

Joseph Haire bid $1075 and secured the contract for the plumbing in the new Industrial School at Newport, R. I.

The Bridgeport Steam Heating Company, Bridgeport, Conn., are putting in a line of plumbers' supplies, which they will make a special feature of their business with the intention of furnishing everything required by the plumber to do first class work. They will, we understand, do no contracting and will not do any plumbing work, but will sell to the trade alone.

The Master Plumbers' Association of Worcester, Mass., met at the Builders' Exchange last week to discuss matters pertaining to the convention of the master plumbers, at Detroit, June 19. John F. Deedy and Henry Desper were elected delegates, with J. W. Jordan and O. S. Kendall as alternates.

Eugene Lewis has purchased the plumbing establishment of C. J. Tremaine, on Pine street, Bradford, Pa.

Delegates Elias Berla and Alexander Don of the Newark, N. J., Master Plumbers' Association will be accompanied to the Detroit convention by ten other members of their association who are interested in the work.

P. E. Cox of Fort Wayne, Ind., intends opening a branch plumbing shop in Columbia City, with Chas. Frixler in charge.

The Shuster Foundry, at Franklin and Willow streets, Philadelphia, report a good demand for their soil pipe and fittings, notwithstanding the dull times. This is mainly on account of the quality of their productions. Their pipe is guaranteed, and plumbers know that if a leak is discovered and traced to a sand hole or other defect in the pipe, the faulty length will be cheerfully replaced, and the time occupied in taking it out and putting the new length in paid for by the concern. Their fittings are appreciated by the trade because they are 2 inches longer on the bead end than the fittings commonly sold.

National Treasurer W. E. Goodman has made special arrangements for transporting the Milwaukee delegation to the Detroit convention of master plumbers. They will attend in full force.

The Brooklyn, N. Y., delegation to the master plumbers' convention at Detroit will leave on the 9.15 train on Sunday morning, over the Erie road, with a full representation.

The new Board of Plumbing Examiners has organized at Dorchester, Mass., by choosing Dr. G. H. Smith chairman and Plumbing Inspector Murray secretary. All plumbers who were not in the business previous to June 10, 1893, must take the examination, application for which had to be filed before June 15.

The Sanitary Plumbing Company, Columbus, Ohio, have opened a branch at Chillicothe, Ohio. E. Futerer and H. Hannon are two members of the company, who have also an expert sanitary engineer and a corps of skilled workmen. They will furnish a consulting engineer to the local plumbers and citizens who desire such service.

John Mitchell, president of the New York City Master Plumbers' Association, will lead the delegation to the Detroit convention accompanied by the Paterson, N. J., delegates in charge of John Hickman and the Bridgeport, Conn., delegation with a military commander, Major Middlebrook. The West Shore route has been selected, two special cars having been chartered, and the delegates are requested to be at the West Forty-second Street Ferry at 4.30 p.m. this afternoon.

Ex-President S. E. Dibble of the Connecticut State Association of Master Plumbers sends us a report of the fourth annual convention held at Hartford February 15. It is a book of 96 pages, giving portraits of the executive officers, a list of the officers and committees, the essays by Zalmon Goodsell, John Troland, Jos. G. Shearlock and Robert Morgan, a list of the members and the constitution and by-laws of the State association.

An interesting circular is being distributed by Thomas Kelly & Brothers, 123 Franklin street, Chicago, Ill., addressed to architects and the plumbing trade. The body of the circular is given up to testimonial letters, signed and dated, all of which speak in the most flattering terms of the Kelly specialties. Many of these letters are from very prominent users of sanitary goods, and they come from all parts of the country. The articles particularly noted on the circular are Kelly's self acting water closets, noiseless water closets, self acting urinals, stop and waste cocks and sanitary wash basins.

Peter J. Carpenter, Dobbs Ferry, N. Y., has secured the contract for the plumbing and gas fitting of J. J. McComb's new mansion. The contract was signed last week, and will amount to about $15,800.

A New Law in Massachusetts.

Last week Governor Greenhalge of Massachusetts signed the following law known as Chapter 455, "An act relative to the licensing of plumbers and the supervision of the business of plumbing:"

Section 1. No person, firm or corporation shall engage in or work at the business of plumbing, either as a master or employing plumber, or as a journeyman plumber, unless such person, firm or corporation has received a license or certificate therefor, in accordance with the provisions of this act. The words "practical plumber," as used in this act, shall be deemed to mean a person who has learned the business of plumbing by working for at least two years either as an apprentice or under a verbal agreement for instruction, and who has then worked for at least one year as a first-class journeyman plumber. The word "journeyman," as used in this act, shall be deemed to mean one who personally does any work in plumbing which is subject to inspection under Chapter 419 of the acts of the year 1892, or under any ordinance, by-law, rule or regulation made under the authority of this act.

Sec 2. Any person not engaged in or working at the business of plumbing prior to July 10 in the year 1893, and desiring to engage in or work at said business, either as a master or employing plumber, or as a journeyman plumber, shall apply to the Board of Health having jurisdiction in the locality where he intends to engage in or work at said business, except in cities or towns where the inspector of buildings has control of the enforcement of the regulations regarding plumbing, where such application shall be made to the inspector of buildings, and shall, at such time and place as may be designated by the Board of Examiners hereinafter provided for, to whom such applications shall be referred, be examined as to his qualifications for such business. On or before September 1 in the year 1894, every master or employing plumber, and every journeyman plumber, engaged in or working at the business of plumbing in this Commonwealth prior to July 10 in the year 1893, and desiring to engage in or work at said business in any city or town where licenses for plumbers are required, shall personally register his name and address at the office of the Board of Health or of the inspector of buildings, to whom applications for licenses are to be made in such city or town, and state after being sworn where and how long he has been engaged in or has worked at said business and whether as a master or employing plumber or as a journeyman plumber. Said Board of Health or inspector of buildings, if satisfied that the person so registering was actually engaged in or working at said business prior to said date, shall thereupon issue to him a certificate, setting forth that he was engaged in or working at the business of plumbing, either

as a master or employing plumber, or as a journeyman plumber, as the case may be, prior to July 10 in the year 1893, and authorizing him to engage in or work at said business, either as a master or employing plumber, or as a journeyman plumber. The fee for a certificate for a master or employing plumber shall be $2; for a journeyman plumber it shall be 50 cents. Said certificate shall be valid and have force throughout the Commonwealth. In the case of a firm or corporation the examination and licensing of, or the registration of and granting a certificate to, any one member of the firm or the manager of the corporation shall satisfy the requirements of this act.

SEC. 3. There shall be in every city, and in each town of 5000 inhabitants or more, and in each town having a system of water supply or sewerage, a Board of Examiners of Plumbers, consisting of the chairman or such other member of the Board of Health as said board may designate, and in cities or towns having an inspector of buildings, the inspector of buildings of said city or town, who shall be members *ex-officio* of said board and serve without compensation, and a third member who shall be a practical plumber of at least five years' continued practical experience, either as a master or as a journeyman, during the years next preceding the date of appointment. Said third member shall be appointed by the Board of Health of said city or town within three months from the passage of this act for the term of one year from May 1 in the year of appointment, and thereafter annually before June 1, and shall be allowed a sum not exceeding $5 for each day of actual service, to be paid from the treasury of said city or town. Provided, that if in any city or town there is no inspector of buildings said Board of Health shall also appoint the second member of said Board of Examiners, whose term of office and compensation shall be the same as is heretofore provided for said third member.

SEC. 4. Said Board of Examiners shall as soon as may be after the appointment of said third member meet and organize by the selection of a chairman, and shall then designate the times and places for the examination of all applicants desiring to engage in or work at the business of plumbing within their respective jurisdictions. Said board shall examine said applicants as to their practical knowledge of plumbing, house drainage and plumbing ventilation, and shall submit the applicant to some satisfactory form of practical test, and if satisfied of the competency of the applicant shall so certify to the Board of Health or inspector of buildings in their respective city or town. Said board or inspector shall thereupon issue a license to such applicant, authorizing him to engage in or work at the business of plumbing either as a master or employing plumber or as a journeyman plumber. The fee for a license for a master or employing plumber shall be $2; for a journeyman plumber it shall be 50 cents. Said license shall be valid and have force throughout the Commonwealth, and shall be renewed annually upon a payment of a fee of 50 cents. In case of removal beyond the jurisdiction of the board or inspector issuing the original license it may be renewed by any board having like authority.

SEC. 5. The Board of Health or Inspector of Buildings, where such inspector has control of the enforcement of the regulations regarding plumbing of each city and town mentioned in Section 3 of this act, shall within three months from the passage of this act appoint one or more Inspectors of Plumbing, who shall be practical plumbers of at least five years' continued practical experience, either as masters or as journeymen, during the years next preceding the date of appointment, and who shall hold office until removed by said board or inspector for cause, which must be shown. All such inspectors shall before appointment be subjected to an examination before the Civil Service Commission. The compensation of such inspectors shall be determined by the board or inspector appointing them, subject to the approval of the City Council or Selectmen, and shall be paid from the treasury of their respective cities or towns. Said inspectors shall inspect all plumbing work for which permits are hereafter granted within their respective jurisdiction in process of construction, alteration or repair, and shall report to said board or inspector all violations of any law, ordinance, by-law, rule or regulation relating to plumbing work, and also perform such other appropriate duties as may be required. The approval of any plumbing by any other inspectors than those provided for under this act shall not be deemed a compliance with the provisions thereof.

SEC. 6. No inspector of plumbing in any city or town shall inspect or approve any plumbing work done by himself, or any person by whom he is employed, or who is employed by or with him, but in each city or town subject to the provisions of this act the Board of Health shall appoint an additional inspector of plumbing, in the same manner and subject to the same qualifications as the regular inspector of plumbing, whose duty it shall be to inspect in the manner prescribed in this act plumbing work done by the regular inspector or any person by whom he is employed, or who is employed by or with him. Said additional inspector shall have authority to act in case of the absence or inability of the regular inspector, and shall receive for his services such compensation as the regular inspector would for a like duty. The provisions of this section shall not apply to any city or town which has heretofore established or may hereafter establish an annual salary for the position of inspector of plumbing, and in any such city or town no inspector of plumbing shall engage in or work at the business of plumbing.

SEC. 7. Each city or town of 5000 inhabitants or more, and every town having a system of water supply or sewerage, shall by ordinance or by-law, within six months from the passage of this act, prescribe rules and regulations for the materials, construction, alteration and inspection of all pipes, tanks, faucets, valves and other fixtures by and through which waste water or sewage is used and carried; and provide that no such pipes, tanks, faucets, valves or other fixtures shall be placed in any building in such city or town except in accordance with plans which shall be approved by the Board of Health of such city or town, or the inspector of buildings, where such inspector has control of the enforcement of the regulations regarding plumbing; and shall further provide that no plumbing work shall be done, except in the case of repair of leaks, without a permit being first issued therefor, upon such terms and conditions as such cities or towns shall prescribe. But nothing in this section shall prevent Boards of Health from making such rules and regulations in regard to plumbing and house drainage hitherto authorized by law, which are not inconsistent with any ordinance or by-law made under the authority of this section by the respective cities or towns within which such Boards of Health have jurisdiction. The provisions of this section shall not apply to the city of Boston or to any officer or board thereof.

SEC. 8. Any person violating any provision of this act, or any ordinance, by-law, rule or regulation made thereunder, shall be deemed guilty of a misdemeanor, and be subject to a fine not exceeding $50 for each and every violation thereof, and if such person has received a license under this act, his license may be revoked by the board or inspector issuing the same, and if such violation was committed in a city or town other than that where he received his license, the Board of Health or inspector of buildings having jurisdiction may forbid him to engage in or work at the business of plumbing for a period not exceeding one year in the city or town where the violation was committed.

If any person to whom a certificate has been issued under this act violates any provision thereof, or any ordinance, by-law, rule or regulation made thereunder, either the Board of Health or Inspector of Buildings issuing his certificate, or the Board of Health or Inspector of Buildings having jurisdiction where such violation was committed, may forbid him to engage in or work at the business of plumbing in such city or town for a period not exceeding one year. Any person engaged in or working at the business of plumbing in any city or town where he has been forbidden to do so under this section shall be deemed guilty of a misdemeanor, and be subject to a fine not exceeding $100 for every such offense. Any city or town mentioned in Section 3 of this act refusing to comply with any of the provisions of this act shall forfeit the sum of $50 to the use of the Commonwealth for every month during which such neglect may continue.

SEC. 9. The provisions of this act shall apply to all persons who are now or may be hereafter learning the business of plumbing, when they are sent out to do the work of a journeyman plumber.

SEC. 10. Any person now holding an appointment as inspector of plumbing may retain his position, and without further examinations, be deemed to have been appointed under this act.

SEC. 11. The Boards of Health and inspectors of buildings hereinbefore mentioned may expend such portion of all fees collected by them under this act as shall become necessary to properly perform all duties imposed by the passage of this act. The said boards or inspectors shall annually, before June 1 make a full report in detail to their respective cities or towns, of all their proceedings during the year under this act.

SEC. 12. All acts or parts of acts inconsistent herewith are hereby repealed. The provisions of this act, so far as they are the same as those of chapter 477 of the year 1893, shall be construed as a continuation of that chapter, and not as new enactments.

A NEW PLUMBING ESTABLISHMENT has been opened at 104 Main street, Ottawa, Ill., by Read & Law of Chicago.

BISSELL CHAMBERLAIN has opened a plumbing shop in the Walden Block, Willimantic, Conn.

C. H. WILLIAMS will represent the New York Central Iron Works, Geneva, N. Y., at the plumbers' convention at Detroit, and the Dunning steam and hot water heater will be incidentally the subject of an occasional remark.

Simple Remedy for Trouble in a Telephone.

The following letter to the *Electrical World* is pertinent at the present time when telephonic communication between the several departments of manufacturing establishments is becoming so common:

"A friend of mine in a neighboring establishment has a telephone containing three ordinary Bell receivers, which are used both as transmitters and receivers. They gave trouble constantly. One would be reported as 'not talking,' and he would take off the cap and find nothing wrong, would put the cap back again and it would work all right. Perhaps in an hour or so it would again refuse to act. This was kept up for several months. He tried varying the distance of the diaphragm from the magneto, and also examined the circuit time and again, but with no better success. One day we noticed that the edge of the orifice of the cap came very close to the diaphragm, and I suggested that perhaps a drop of saliva might lodge against the diaphragm and the edge of the orifice and impede vibration. This was found to be the case, and a ring of thick cardboard placed between the cap and the diaphragm remedied the trouble completely."

A New Bedford, Mass., rope company have received an order from a Chicago firm for a rope which, it is said, will be the largest ever made. It is to be used on the driving wheel in the engine room of the Chicago Cable Road Company. It will be 3 inches in diameter and 11 inches in circumference. There will be 12 of these ropes on the wheel; each of them will be 1260 feet long and the combined length of the 12 ropes will be 3 miles. The cost will be $5000.

Petroleum in paying quantities is being found in Wilson, Neosho and Allen counties, Kansas, and about 40,000 acres of land have been leased by oil operators from Pennsylvania.

Baltimore comes next in importance to New York as a grain shipping port, handling 50,000,000 to 60,000,000 bushels annually, and about 3,500,000 barrels of flour.

TIN PLATES.

A Strange Statement.

It will be news, indeed, to the trade that the tin plate mills of this country have during the past winter been selling nearly all their product in Canada, "the boasted home market having proved insufficient to furnish a source of trade." Yet this is the surprising statement made editorially in a recent issue of a Pittsburgh daily. The announcement was so authoritatively made that it probably set some uninformed persons wondering whether the American tin plate manufacturers had already opened up a large export trade for their product. The facts of the case, however, given on the best authority, prove that the writer of the statement in question has gotten hold of a very small mole hill, and with the aid of an exceedingly powerful imagination has magnified it into a mountain of great proportions. In a late issue of *The Metal Worker* an extract was given from an article in the *Canadian Manufacturer*, which spoke in high terms of the superior qualities of a box of assorted tin plates of American manufacture which had been received and tested by a Toronto manufacturing firm. This one shipment of a single box of American plates, sent for comparison with the Welsh product, covers, so far as we have been able to ascertain, the entire export movement, which, according to the Pittsburgh *Post's* statement, has of late absorbed nearly all the product of our domestic tin and sheet mills. Of course, every one with a grain of information is aware that American tin plate makers cannot yet hope to sell their goods in Canada in competition with the Welsh product. Nor do they need to seek outside markets, for there is, as we have before pointed out, an active demand within the limits of the United States for every sheet of tin and terne plates they can at present produce.

SCRAP.

ÆTNA STANDARD IRON & STEEL COMPANY, Bridgeport, Ohio, have two mills in operation, rolling black plates for tinning. The firm's new tinning department will be completed within a few weeks, when they will commence the manufacture of both bright and terne plates.

A CONSIDERABLE QUANTITY of black plate is now being shipped from Great Britain to Italy, to be converted into turned plates in the lately established works at Plombino.

THE BRITTON ROLLING MILL COMPANY, Cleveland, Ohio, manufacturers of iron and steel sheets, and who have had under erection for some time a plant for the manufacture of tin and terne plate, advise us that one tin mill will be started on Monday, the 18th inst., providing a supply of coal can be obtained. This firm expect to have two more mills in operation by August 1 next.

ACCORDING to the British Board of Trade statistics for May, 1894, the total exports of tin and terne plates from Great Britain during the month were 30 000 tons, against 37,000 tons in May, 1893. Shipments to the United States show a considerable increase over those of April, and were larger than in any previous month of this year. The following figures show, in round numbers, the shipments to this country since January 1: January, 18,000; February, 13,000; March, 16,000; April, 13,000; May, 21,000 tons. In May, 1893, the receipts of Welsh tin plates amounted to 26,000 tons.

THE MORFA TIN PLATE WORKS, Llanelly, South Wales, were restarted this week after a prolonged suspension.

CAPITALISTS of Cambridge, Ohio, have announced their intention of building a rolling mill for the manufacture of black plates for tinning purposes. The proposed plant is to be built at the junction of the Baltimore & Ohio and the Cleveland & Marietta railroads, and will consist of about six mills, together with a train of cold rolls and complete equipment. The buildings projected are one 200 x 100 feet for rolling mill purposes, one 200 x 60 feet for annealing, pickling and shipping, and a boiler house 40 x 60 feet. All buildings will be constructed of steel and iron and the machinery has been designed to conform to modern ideas of economical production of the best quality of plates obtainable. The leading spirits of the enterprise are John Marquand, C. L. Campbell and John C. Beckett, all of Cambridge. It is expected that the organization will be completed in a few days.

THE TIN HOUSE recently erected by the Ætna Standard Iron & Steel Company, Bridgeport, Ohio, has a capacity for tinning about 900 boxes of black plates per week, the outfit consisting of three sets, one for terne and two for bright plates. This firm do not expect, however, to put any coated plates on the market until about July 1. Their black plate mills have been in operation for about ten days working up stock for the tinning house. Their rolling mill proper is working to about two-thirds capacity on natural gas, the remaining portion being off on account of the coal strike.

NEW PHILADELPHIA IRON & STEEL COMPANY, New Philadelphia, Ohio, are adding six tin mills to their plant and will, we are informed, shortly be in the market with black sheets for tinning purposes, in addition to their former line of sheet iron products.

EASTERN TIN PLATE MANUFACTURERS are at the present time feeling the effects of the coal strike in the dearth of American black sheets. They find it very difficult to obtain a sufficiency of the domestic product and are obliged to exercise the virtue of patience to an uncomfortable degree. As an illustration of the active demand now existing for American sheets for tinning purposes, the New York agent of a Western sheet mill mentioned a day or two ago the fact that he had just been obliged to refuse large orders from three tin plate makers who came at almost the same time, one wishing for ten carloads of black sheets, prompt delivery, for spot cash another two carloads a week for eight weeks, and the third wanting to take as much of the material as he could get. All the black sheet mills are rushed with orders and tin plate manufacturers are said to show a marked disinclination to take any but the American rolled product, which they find much better suited to their purposes than the imported article.

ACCORDING to a return published last week by the secretary of the Welsh Tin Plate Makers' Association, there are at the present time 90 tin plate works, with 510 mills, in existence in Great Britain. Of these mills, 330 are in operation and 180 are idle. Among the latter, however, are about 30 which are virtually out of business altogether and not likely to restart. Consequently the proportion of idle producing capacity is about 30 per cent. of the whole, a smaller ratio than was generally believed to be inactive. Since the above figures were given one or two of the then idle mills are reported to have resumed operations, still further reducing the proportion of idle works

Trial of the U. S. Cruiser "Minneapolis."

On her preliminary trial trip last week, the new Philadelphia built triple screw cruiser "Minneapolis" attained the remarkable speed of 22.26 knots per hour, under the disadvantage of burning anthracite coal instead of the Pocahontas coal, always used on trial trips hitherto. Her sister vessel, the "Columbia," only made 20.98 knots on her first trial, so that the "Minneapolis" showed fully 1¼ knots greater speed. The trip was made off the New Jersey coast under far from favorable conditions as regards weather. Nevertheless the trial proved throughout the most satisfactory and successful run of any ships the Cramps have built. Passed Assistant Engineer Willets, who represented the Engineering Bureau on the "Minneapolis'" trial trip, reports that the performance of the machinery was remarkably good. On the 7th a maximum speed of 22 26 knots was maintained in deep water for an hour with an average of 128 7 revolutions per minute of all three engines, steam pressure 160 pounds at the boilers, forced draft of less than 1 inch air pressure, throttle half open. The displacement of the ship was less than 7000 tons, and the speed was recorded by patent log, corrected from runs over a known course the day previous. The engines ran very quietly and steadily at all speeds with no unusual vibration. The indicator cards taken on the last part of the deep sea run were worked out, showing 20,080 horse-power. The "Minneapolis" will make her official run about July 9.

Illuminating oil sold by the Standard Oil Company has touched this week the lowest price ever reached, the result of a fight against outside dealers.

STEAM AND HOT WATER.

Master Fitters' Convention.

The preparations for the sixth annual convention of the Master Steam and Hot Water Fitters' Association of the United States, which begins Tuesday of next week at the Broadway Central Hotel, New York, are being rapidly completed, and Secretary Reynolds reports that according to all the promises that are made, it is destined to be a surprisingly large and successful gathering. No one needs to be informed that the year just closed has been a difficult one for the trades, and anything that is adverse to business prosperity is likewise adverse to the prosperity of trade associations. In the West in some ways the depression has been particularly hard upon the steam and hot water fitters, but diminished business has been an unpleasant characteristic throughout the whole country. With these adverse conditions, therefore, it is particularly gratifying to hear that the reports from the members go to show that interest is unabated in the national organization and that the attendance promises to be large.

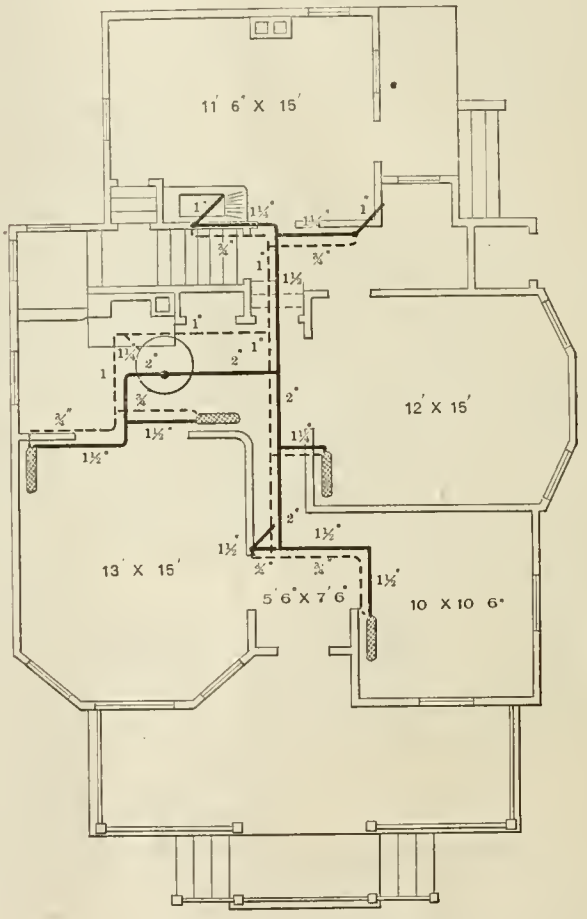
The Broadway Central Hotel is conveniently located, being half way between the downtown trade center and the uptown attractions of the city. One of the best indications of the success of the coming convention is the interest that is being taken by the manufacturers of boilers, supply houses and kindred concerns. It goes without saying that if they did not look for a representative gathering they would go to little trouble to be present or have their goods shown. As a matter of fact already a very large number of applications have been made for space and many prominent concerns will have representatives at the hotel. The following is a partial list of manufacturers who have already made arrangements to be present or represented at the convention:

Jenkins Bros.
American Radiator Company.
U S. Steam Heater Company.
N. P. Andrus.
A. A. Griffing Iron Company.
Fowler Radiator Company.
Raymond & Campbell Mfg. Company.
Richmond Stove Company.
American Boiler Company.
Boynton Furnace Company.
Thayer Heater Company.
Kennedy Valve Company.
Walworth Mfg. Company.
Fosket & Bishop Company.
Herendeen Mfg. Company.
Gurney Heater Company.
Smith & Anthony Company.
Niagara Radiator Company.
E. F. Keating.
Henry R. Worthington.
Thatcher Furnace Company.
Abendroth Bros.
Crane Company.
H. B. Smith Company.
Fuller & Warren Company.
J. H. McLain Company.
Deane Steam Pump Company.
Page Boiler Company.
Ideal Boiler Company.
Eaton, Cole & Burnham.
Model Heating Company.
Timothy Kieley.
Nason Mfg. Company.
W. C. Mowry.
Wells & Newton.
New York Central Iron Works.

F. T. Davis, Portland, Maine, for the past two years agent for Smith & Anthony Stove Company's Hub heaters in Portland and vicinity, has associated himself with Reuben Westcott and together they will continue to represent the Hub heater.

Small Return Pipes.

We have had opportunity lately to inspect a steam heating plant installed by George H. Murphy, Bound Brook, N. J., in the residence of George B. Stryker of the same place. Mr. Stryker is an architect and contractor, and the plans herewith show the first and second floors of his residence, which was completed during the past winter. Fig. 1 shows the first floor and the location of the radiators and the boiler and the pipes in the cellar beneath. Fig. 2 shows the upper floor and the location of the radiators. The building is exposed on all sides, but has been heated to the entire satisfaction of the occupants. One of the Auburn steam boilers made by F. W. Wright, No. 6 Bridge stores, New York, was used, and the piping, which was run in accordance with the ideas of Mr. Murphy, is a combination of the one and two pipe systems. No return pipe is placed above the cellar ceiling, and all of the radiators are attached by means of a single connection. The return pipe is connected in each case by a tee at the bottom of the riser to the radiator above.



Small Return Pipes.—Fig. 1.—First Floor, Showing Boiler and Piping.

A 2½-inch main is taken from the top of the boiler and a 2 inch branch runs each way from it. The left hand branch merges into two 1½ inch branches, one of which is connected with the hall radiator, which has 44 feet of radiating surface; the other branch continues to the parlor radiator, which has 44 feet of surface also. The other main of 33 feet each, one in each of the front bedrooms. The main in the cellar is continued 1½ inches in size to a 33-foot radiator in the office on the first floor. Directly under the riser which runs to the radiator in every case a ¾-inch return pipe is connected by means of a tee, as shown in Fig. 3. The size of the return pipe where it connects

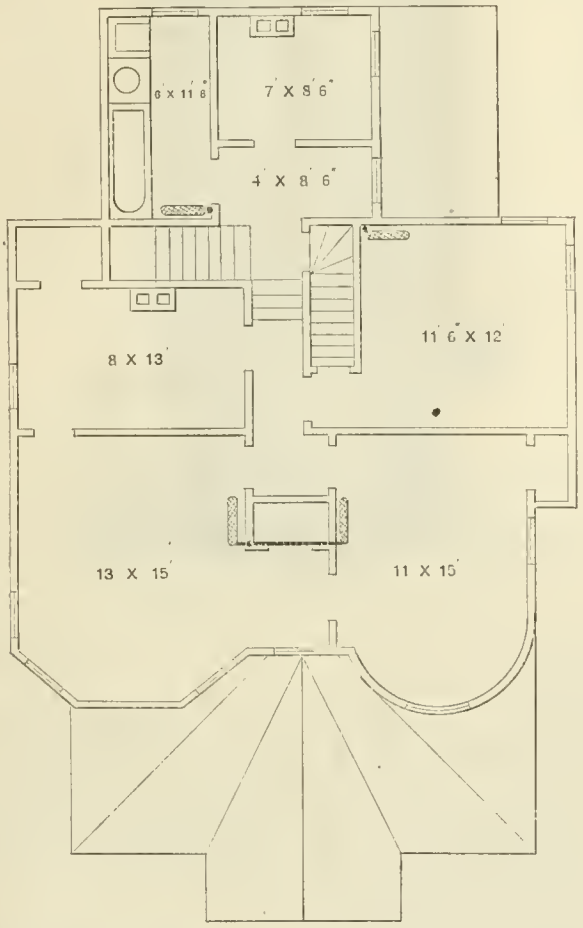


Fig. 2.—Second Floor and Radiators.

branches into a 2-inch and a 1½ inch main, the smaller one running toward the back of the house, branching into two 1¼-inch mains and continuing until a 1-inch riser is taken from each—one to the bathroom radiator, with 22 feet of surface, and the other to the chamber

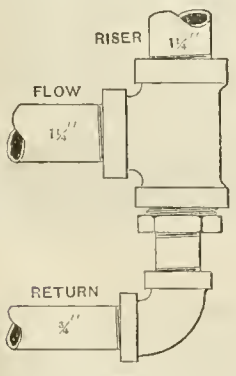

Fig. 3.—Showing Method of Connecting Return.

above the dining room, which has 33 feet of surface. The 2-inch branch main runs toward the front of the house, a 1½-inch branch being taken off to the radiator of 44 feet of surface in the dining room, and continuing on a 1½ inch riser is taken to the second floor and a 1-inch connection made to two radiators in every case is ¾ inch, and the returns from the parlor and hall radiators continue this size all the way to the heater.

The returns from the bathroom and dining room chamber are ¾ inch up to where they join. At that point they connect with a 1-inch pipe, which runs to a point where it joins with the return from the front of the house. The returns from the front chambers and the office are ¾-inch and connect with a 1-inch pipe where they meet. This 1-inch pipe receives a ¾ inch return from the dining room and runs on and connects with the return from the back of the house, where a 1-inch pipe runs over to the boiler. At the boiler all of the returns connect with a 1½ inch pipe, which drops down and connects with the heater at the bottom. The flow mains of this job have the usual amount of pitch, but the returns have three or four times as much and no difficulty is experienced in running the system satisfactorily on less than a pound of pressure at the boiler. The use of such small returns is unusual, but is attended with success, to which the sharp decline which they have toward the boiler contributes not a little. Mr. Murphy is a qualified master plumber and has spent several years in large car shops, where in addition to doing plumbing work he worked iron pipe in all shapes, bending it either cold or hot, and through his ability rose to a superintendency of the car heating department. The plant illustrated is but one of many that he can show in successful operation.

Some Generous Comments.

From A. C. Edgar, *Philadelphia.*—In an article appearing in the May number of one of your contemporaries, "Chicago" criticizes the methods of piping a hot water job as shown in *The Metal Worker* of February 10, 17, 24. "Chicago" wishes the reader to understand that all contributors to *The Metal Worker* are not practical, but get their ideas from that great deceiver, theory. The piping proposed by "Helios" in *The Metal Worker* of February 17 is pronounced by "Chicago" "so impracticable that they are not worth mentioning." This statement seems to satisfy "Chicago," but it so seldom occurs that all are of the same opinion that this statement is not satisfactory without some proof of its correctness. "Helios" is a practical engineer with an enviable reputation and generally taken as authority on subjects of this kind, always giving explanations that are satisfactory to practical engineers who recognize that there is frequently more than one way of obtaining the desired results.

"Chicago" claims that "the second opening from the main will not circulate until the first has a good circulation." This is not so, as my practical experience (of less than 30 years) has taught me that it is possible, by taking the openings near boiler from side of main, and others at different angles, as the conditions require, to obtain an equal circulation in all radiators.

"Chicago" criticises several other correspondents in the same strain whose plans have as little need of defense.

The system recommended by "Chicago," which he calls positive, cannot be called good practice, for when in operation the radiators on third floor will be at higher temperature than those on the lower floors, and the radiators on first floor being generally much larger than the upper ones, will give poor results when fed from returns. The valves near ceiling on main return is another objection to this positive system, and carrying the return from lower radiators to ceiling will not allow the free circulation that there would be if returns were carried along the floor. I consider that "Chicago" has neglected the most important part of the job in not giving sizes of pipes and radiators, which, if not properly proportioned, will prove a failure. I know there are few systems that cannot be changed. Often changes are made that increase the efficiency of the apparatus, but many are made simply to satisfy personal fancies. Of all the systems recommended, I think "Chicago's" no better than some, and not nearly as perfect as others. I am not objecting to "Chicago" upholding the system he proposes, but I think he should be more charitable to the lesser lights who venture to express their opinion, by not condemning all systems that do not meet with his approval.

The Model Heating Company, Philadelphia, Pa., announce, under date of June 1, that they have secured the services of M. B. Moore, formerly with the Boynton Furnace Company, who will give his attention to the interests of the Novelty circulator and the Novelty steam generator for hot water and steam heating.

Crane Company's New Valves.

The Crane Company of Chicago and New York have recently brought out some new valves, two of which are herewith illustrated. Fig. 1 is a wedge gate straight way valve, designed for ordinary pressure, for either steam or water, and made in all sizes from 2 to 24 inches. The gate is guided in the body by ribs, which insure true and

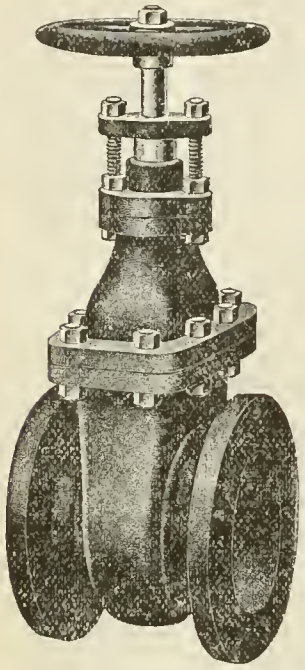

Fig. 1.—The Crane Wedge Gate Straight Way Valve.

easy movement and prevent wear of the faces as well as prevent the disks from touching the seats of the body of the valves except at the point of closing. The seats in the body of the valves and the faces of the disk are made of bronze metal. These valves are furnished with

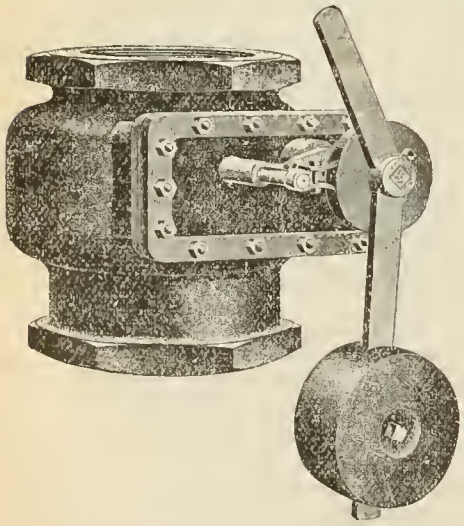

Fig. 2.—The Crane Noiseless Back Pressure Valve.

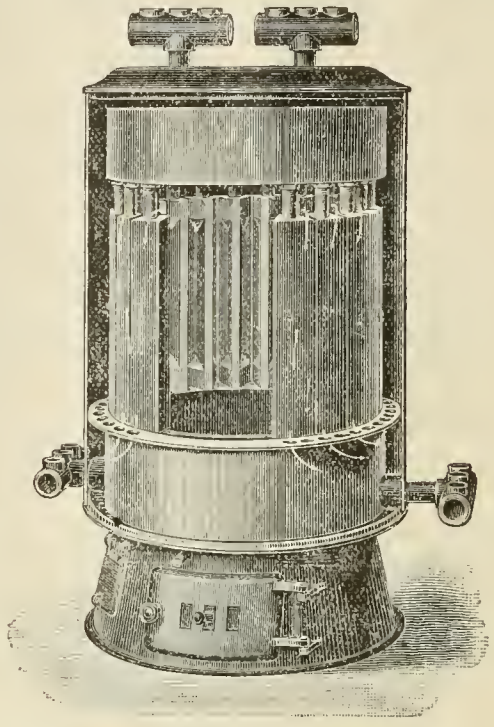
either screwed, flanged or hub ends, with stationary stem, with outside screw and yoke, with bevel and spur gearing, with gearing and by-pass relief and with indicator. The manufacturers claim many points of advantage for this style of construction and have applied for patent.

Fig. 2 illustrates Crane's patent noiseless back pressure valve for condensing and non-condensing engines. It is constructed with a piston having ports around its sides, the combined areas of which are greatly in excess of that of the pipe. This piston is accurately fitted to the body of the valve, in which it slides freely. When pressure is brought against the under side of the piston it rises, opening the ports just sufficient to let the steam escape, and at the same time it maintains the pressure for which it is set. It has no seat. The opening and closing of the valve are regulated entirely by the weight. This valve was designed to overcome the objectionable and destructive hammering peculiar to the common back pressure valve. Complicated adjustments were avoided, so that it is not liable to get out of order.

Standard Hot Water Heater.

A new form of hot water heater known as the Standard is being placed on the market by Giblin & Co., Utica, N. Y. Fig. 1 is a view of the heater with the casing removed, showing the inner construction, while Fig. 2 is an illustration of the water sections forming the portion of the boiler between the fire pot and upper drum. The heater is made entirely of cast iron, with the exception of the nipples. The construction, as indicated, is vertical, so that the water has a free and clear passage, and it is pointed out that the water goes into circulation as soon as it passes over the hottest surfaces. Another point alluded to is the way the water is spread over a large surface in sheet form so as to effectively absorb the heat of the fire. The boiler proper consists of a water space fire pot into which are screwed a number of vertical sections, forming a large combustion chamber. A water space reservoir forms a large crown sheet surface over the fire, and is connected to the ends of the vertical sections by nipples of sufficient length to permit the products of combustion to pass out and downward in contact with the entire outer surfaces of the sections and of the fire pot. Fig. 2 is an illustration of the water sections used in the Standard boilers. These sections, occupying a vertical position in the boilers, are designed to give easy circulation



The Standard Hot Water Heater.—Fig. 1.—View of Boiler with Casing Removed.

and to readily absorb the heat. Each of the sections presents a large surface to the direct rays of the fire and at the same time holds comparatively little water. The surfaces of the sections are T-shaped, so that when a number of them are arranged in a circle with narrow ends to the fire, a very large fire surface is the result. It is pointed out that the

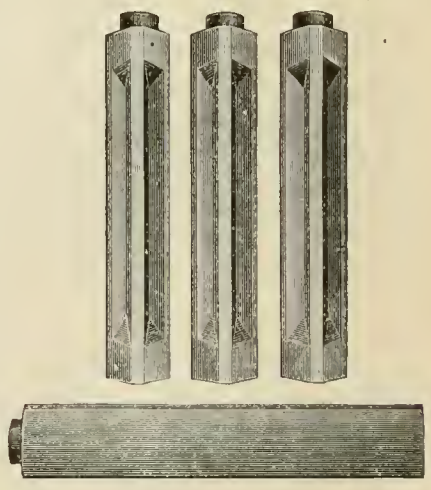


Fig. 2.—View of Sections.

surfaces being vertical do not collect dirt. They are connected with the fire pot by short nipples and are screwed down tight to it, the fire pot and sections each taking one-half of the nipple. The tops of the sections are formed like hexagon shaped nuts, so that one or more of them may be readily removed and others inserted in case of accident. A special feature to which the manufacturers direct attention is the down draft. They claim to have improved the ordinary application of this principle by adding a perforated ring plate which rests on and is on

a line within the top and outer surface of the fire pot, Fig. 1, and serves to distribute the draft uniformly over the outer boiler surface. This distribution is accomplished by having the smallest holes in the plate directly over the indirect smoke collar, which serves to prevent a direct down draft at that point, and the holes are graduated in size so that in the front of the boiler the largest holes in the plate are found. The entire upper section of the combustion chamber, it is pointed out, is thus kept hot and the drafts traveling through the perforated plate pass below the plate and outside the hollow fire pot, thus inclosing it between the fire itself and the heated products of combustion. The Standard hot water heater is made in three sizes: Diameter of fire pot 15, 20 and 24 inches; adapted to supply from 350 to 1200 square feet of direct radiation. These boilers are used for both steam and hot water, the only change being in the size of the reservoir and the trimmings.

HEATING NOTES.

The Raymond & Campbell Mfg. Company, Middletown, Pa., have received the contract from one of the largest jobbing houses in Paris, France, for supplying their Lindemuth Sun (steel) steam and hot water boilers. The French company have branch houses in most of the leading cities throughout France, and in their agreement they ask for the entire control of this boiler for France, which offer, we understand, the company have about decided to accept.

Home Comfort radiators, manufactured by Reuben Westcott, successor to the Portland Heater & Radiator Company, Portland, Maine, are now made for either hot water or steam. A change in form also has been made, substituting a flat top for the old style. A feature of this radiator is a projecting base and a nickel rail foot rest designed to take the place of an open grate for warming the feet.

We are indebted to the American Radiator Company, Chicago, Ill., of which J. A. Goodrich, 92 Centre street, is New York manager, for a copy of their new pocket catalogue, illustrating the various styles of radiators manufactured by them. It conforms to the excellent taste and style that distinguish the work of this concern, the catalogue being an end opening publication 7½ inches long and 4½ inches wide, bound in black with silver lettering. The title pages gives the name of the concern and the addresses of their Chicago, New York, Boston, Minneapolis and Denver offices, a list of their officers and directors and the location of their factories at Detroit and Buffalo. In directing the attention of the trade to the contents of this little pamphlet they point with pardonable pride to an assortment of radiators which they say has resulted from an experience covering a period of more than a quarter of a century. They emphasize the fact that the loops of the American radiators contain the full area of heating surface claimed and are arranged to give the most effective results. The volume is divided into three parts, the radiators illustrated on pages 6 to 38 being manufactured at their Pierce plant, at Buffalo; those on pages 40 to 54 being manufactured at their Detroit plant, Detroit, Mich.; while those on pages 57 to 87 are made at their Michigan plant, Detroit, Mich. The extent of the line of radiators made by this company is well understood by the trade and needs no particularizing here. At the end of the pamphlet are directions for decorating, telegraphic code, &c. The printing is done in black and red and high grade paper makes a fine display of the engravings and of the type.

At a recent meeting of the Sperl Heating Company, Carbondale, Pa., drafts of proposed buildings were submitted by their engineer. They are to be of the slow burning mill construction style, and bids will be asked from builders as soon as specifications are completed. The company now have space in another manufactory, where their workmen are making three sizes of boilers and patterns for another size are nearing completion.

A mammoth poster is sent us by the Herendeen Mfg. Company, Geneva, N. Y. The feature of the sheet is a sectional view of the Faultless Furman hot water boiler, lithographed in colors. The construction of the boiler is clearly shown and the course of the water currents and products of combustion indicated.

The Raymond & Campbell Mfg Company, Middletown, Pa., manufacturers of the Lindemuth Sun (steel) steam and hot water boilers, will have one of their boilers on exhibition at the coming convention of the Master Steam and Hot Water Fitters' Association, which is to be held on the 18th, 19th and 20th of this month at the Broadway Central Hotel, New York City. H. H Lindemuth, their mechanical engineer, will be in charge of the exhibit and will be glad to meet all the friends and customers of the company, and will no doubt take pleasure in explaining the many interesting features of his boiler, even to those who are not at present patrons of the company.

The Richmond heaters are the subject of description and illustrations in two pamphlets that have been received. The catalogues, of convenient size, are bound in scarlet paper and give full illustrations and descriptions of the extensive line of Richmond heaters. One of these pamphlets is issued in the interest of Webster & Meathe, Detroit, and the other carries the name of George T. Barnes, Newburg, N. Y.

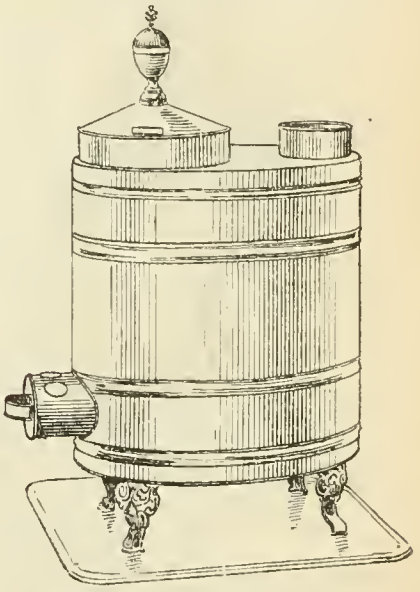
The Smith & Anthony Company of Boston will be well prepared to meet their friends at the steam fitters' convention in New York next week They have secured one of the best spaces at the Broadway Central, just at the left of the staircase in the basement. There they will show samples of the Hub steam heater and Hub hot water heater, and their representatives in attendance will welcome the trade. They have also secured parlor No. 357, where they invite all their friends to call and make themselves at home.

B. H. Rose has accepted a prominent position with the American Boiler Company and will be located in their Chicago office. Mr. Rose is well known in the trade, having been connected with the Hardware business for the past 20 years. He has resigned his office as treasurer of the Pullman Sash Balance Company of Rochester, N. Y.

The condition of depression into which the business of the United States fell in the latter half of last year is clearly illustrated in the report of the Chamber of Commerce of this city, just issued. The Clearing House exchanges for 1893 are therein stated to have been no less than $5,649,367,056 under those of the previous year, and the lowest in amount since 1888. The value of the imports of foreign merchandise in 1893, exclusive of coin and bullion, was nearly $100,000,000 less than the total for 1892, while exports in the same period showed a comparative decrease of $63,000,000.

Cole's Air Tight Heater.

The accompanying cut represents a general view of what is known as Cole's Air Tight Heater, now being manufactured by Cole & Cole, 41 Main street, Council Bluffs, Iowa. This stove is constructed with a view to using wood, cobs and, in fact, all kinds of light fuel. It is made of sheet metal lined with sheet steel, and has a separate collar in the lining of the stove which thoroughly protects the draft opening.



Cole's Air Tight Heater.

The makers are offering this stove in three sizes and two styles, using smooth iron in the cheaper and Russia iron in the higher styles. The length of wood which can be burned is indicated by the numbers of the stoves. It is claimed that the Air Tight Heater will hold fire 20 hours using cobs as a fuel, and 48 hours burning wood. When shut up the stove is safe from sparks or fire, as it has no doors to jar open or apertures through which fire or sparks can escape. The company state that the large size stove will hold 2 bushels of cobs, the combustion of which can be so controlled as to give a steady, slow heat for the period named above.

The popularity of municipal bonds with investors at the present is evidenced by the *Financial Chronicle's* published table of such issues marketed during May. The total amount of sales reported in that month was $14,350,000, a considerable increase on any monthly sales this year, and exceeded only once since the establishment of the record. The high prices paid, too, were remarkable. Several cities have placed their bonds on more favorable terms than they have ever been able to secure before.

The revenue of Canada for the month of May shows a falling off of over $500,000, as compared with the corresponding month last year. The decrease for the ten months of the fiscal year is over $13,000,000.

ROOFING AND CORNICE.

The Country Cornice Shop.

X.

BY CORNICE WORKER.

Patterns for Y-Branches, Round Pipes.

In Fig. 98 is shown the method of connecting two molded eave troughs with one leader by means of a Y-branch. in case the leader is frozen tight at the bottom.

The method of obtaining the patterns for the Y is shown in Fig. 99. The first step is to draw correctly the plan and elevation of the Y-branch, having them in their relative position to each other as shown in Fig. 99.

Let C¹ D E F G, Fig. 99, represent a front elevation of a Y-branch, corresponding to any given angle, shown by B C D E F, Fig. 98, and let B, Fig. 99, be the plan view of the larger pipe and A and C the plan views of the two smaller pipes. It will be noticed that the angles of the Y, as shown by C¹ D E and E F G, are both alike, and therefore only one set of patterns is required. It will be noticed that the smaller pipe C, Fig. 99, abuts against the larger pipe B in plan, the centers being in one line. Now, if the center points of the pipes were placed to one side of each other, the principles used in obtaining the patterns would still be the same. To obtain the pattern for the Y-branch, as shown by the plan and elevation in Fig. 99, proceed as follows: Divide the smaller pipe C in plan into any number of parts, as shown by the small figures, and have the seam to be placed as shown at A¹. Now at right angles to the line

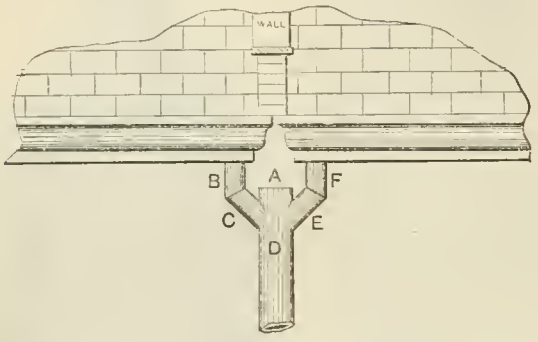


Fig. 98.—Method of Connecting Two Molded Eave Troughs by Means of a Y-Branch.

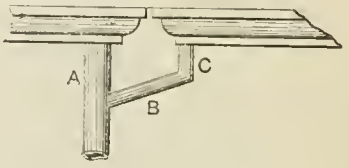

Fig. 100.—Method of Connecting Two Eave Troughs with a Leader by Means of a T-Joint.

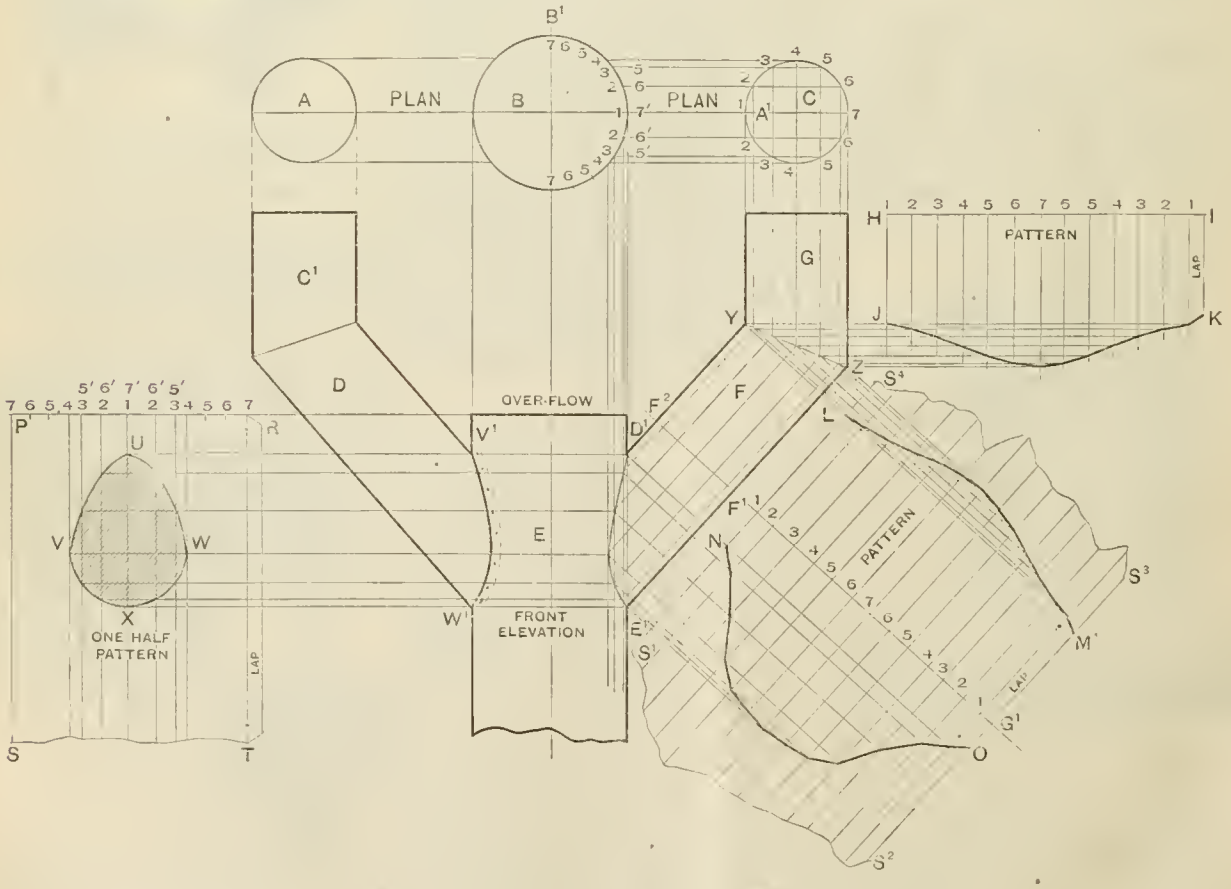

Fig. 99.—Development of Pattern for a Y-Branch Made of Round Pipe.

THE COUNTRY CORNICE SHOP.—PATTERNS FOR Y-BRANCHES MADE OF ROUND PIPE.

It will be noticed by referring to the front elevation, Fig. 98, that the leader D runs slightly above the miter joints of the Y, as at A, which can be left open, and serve as an overflow in case of the sewer or leader stopping up, or

E B¹, Fig, 99, draw lines from the small figures on the circle C, intersecting the larger circle or center leader B, as shown by the intersections 4, 3 5′, 2 6′ and 1 7′, &c., corresponding in number to 4, 3 5, 2 6 and 1 7, &c., of the smaller circle C. Parallel to the line B¹ E drop lines indefinitely from the intersections on the plan B, as shown. Now from the spaces obtained on the plan C, Fig. 99, drop lines parallel to B¹ E intersecting the miter line of the elevation Y Z. From the intersections obtained upon the miter line Y Z draw lines parallel to the lines of the pipe Y D¹ or Z E¹ intersecting the perpendicular lines of corresponding numbers dropped from the intersections on the plan B. A line traced through these intersections, as shown from D¹ to E¹, will be the required miter line from which to obtain the measuring points for the pattern. For the pattern for that part of elbow shown at G proceed as follows: At right angles to B¹ E draw the stretchout line H I, upon which place the stretchout of the smaller pipe C, as shown by the small figures on the line H I. Now at right angles to H I, or parallel to B¹ E, drop lines indefinitely from the small figures, as shown, which intersect with lines of corresponding numbers drawn parallel to H I from the miter line Y Z. A line traced through these intersections, as shown from J to K, will be the required miter cut; or H J I K will be the required pattern for that part of elbow shown at G, Fig. 99. A lap is allowed for riveting, as shown. To obtain the pattern for that part of the elbow shown at F, and intersecting the larger pipe E, proceed as follows: At right angle to the line of the pipe E¹ Z draw the stretchout line, as shown by F¹ G¹, upon which place the stretchout of the smaller circle C, shown in plan view, as indicated by the small figures on the stretchout line F¹ G¹.

At right angles to F¹ G¹ draw lines indefinitely through the small figures on the stretchout line, as shown, which intersect with lines of corresponding numbers drawn at right angles to E¹ Z from the miter line Y Z at the top, and from the miter line forming the intersections of the two pipes shown by D¹ E¹ at the bottom. A line traced through these points, as shown from N to O and M to L, will be the required pattern for that portion of the elbow shown at F in front elevation, Fig. 99. In obtaining patterns of this kind it is not always convenient to obtain them with the use of the T-square, as just described. In shop practice the stretchout line is placed directly upon the sheet metal, the measurements being taken from the elevation and placed thereon by means of the compasses or dividers.

To illustrate: Let S¹ S² S³ S⁴, in Fig. 99, represent a piece of sheet iron upon which is drawn the stretchout line, as shown from F¹ to G¹, and through the small figures thereon the usual measuring lines are drawn. Extend the stretchout line G¹ F¹ as shown to F². Now measure the distance from the line F¹ F² to where the line 1 cuts the miter line Y Z, and transfer the distance to the sheet metal on the lines 1, 1, measuring from the line F¹ G¹.

Then again measure the distance of the line 2, commencing on the line F¹ F² in elevation, to where line 2 intersects the miter line Y Z, and transfer this distance upon the line 2 2 on the sheet metal, measuring from the line F¹ G¹. In this way all the points will be transferred to the sheet metal, thus completing the pattern N O M L, as shown in Fig. 99. A lap for riveting is allowed, as shown. To obtain the pattern for the opening D¹ E¹, Fig. 99, proceed as follows: At right angles to B¹ E draw the line P R indefinitely, upon which place one-half of the stretchout of the larger circle B, as shown by the small figures from 7 to 7 on the stretchout line P R. It will be noticed, by referring to the plan, that the spaces 1 and 7 of the smaller pipe C intersect the larger pipe B on one line, and is indicated on the profile B, as shown by 1 7′. In the same manner do the spaces 2 6 and 2 6 and 3 5 and 3 5 of the circle C intersect the larger circle B on separate lines, and are indicated on the profile B by 2 6′, 2 6′ and 3 5′, 3 5′ respectively. Therefore are the figures 5′, 6′, 7′, 6′, 5′ placed over the figures 3, 2, 1, 2, 3 on the stretchout P R, corresponding to the numbered spaces on the profile B in plan. Now at right angles to the stretchout line, and through as many points in the stretchout as correspond to the points of the smaller pipe C, intersecting the larger pipe B as shown in plan, drop lines from the stretchout P R, as shown, which intersect with lines of corresponding numbers drawn at right angles to B¹ E or parallel to P R from the miter line D¹ E¹. A line traced through these intersections, as shown by U V X W, will be the required opening to be cut in the larger pipe B, and on to which the pipe F shown in front elevation will miter. At V¹ W¹ in Fig. 99 is shown the method of putting a flange on the elbow C¹ D, placing the flange on the inside of the larger pipe E, either soldering or riveting, as shown.

It will be noticed that P R S T in Fig. 99 represents but one-half of the larger pipe B, as shown in plan. After the half pattern is completed as shown, and the opening U V X W cut out, turn over the pattern on the line P S and trace the pattern on the other side, including the opening U V X W, omitting the lap shown from T to R, which will then be the complete pattern desired.

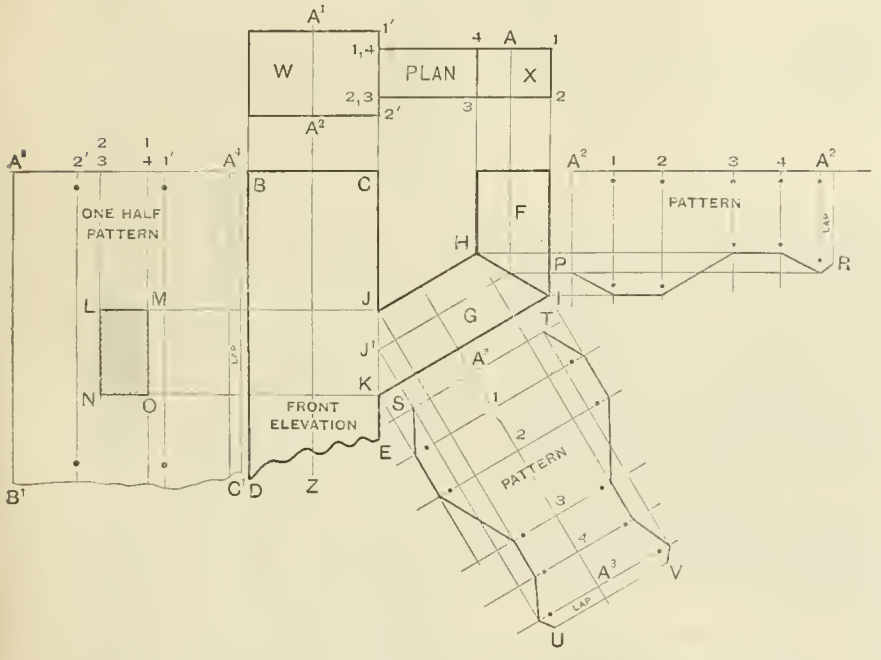

Fig. 101.—*Development of Patterns for a T-Joint Made of Square Pipe.*

THE COUNTRY CORNICE SHOP.

right angles to B¹ E draw the stretchout line H I, upon which place the stretchout of the smaller pipe C, as shown by the small figures on the line H I. Now at right angles to H I, or parallel to B¹ E, drop lines indefinitely from the small figures, as shown, which intersect with lines of corresponding numbers drawn parallel to H I from the miter line Y Z. A line traced through these intersections, as shown from J to K, will be the required miter cut; or H J I K will be the required pattern for that part of elbow shown at G, Fig. 99. A lap is allowed for riveting, as shown. To obtain the pattern for that part of the elbow shown at F, and intersecting the larger pipe E, proceed as follows: At right angle to the line of the pipe E¹ Z draw the stretchout line, as shown by F¹ G¹, upon which place the stretchout of the smaller circle C, shown in plan view, as indicated by the small figures on the stretchout line F¹ G¹.

At right angles to F¹ G¹ draw lines indefinitely through the small figures on the stretchout line, as shown, which intersect with lines of corresponding numbers drawn at right angles to E¹ Z from the miter line Y Z at the top, and from the miter line forming the intersections of the two pipes shown by D¹ E¹ at the bottom. A line traced through these points, as shown from N to O and M to L, will be the required pattern for that portion of the elbow shown at F in front elevation, Fig. 99. In obtaining patterns of this kind it is not always convenient to obtain them with the use of the T-square, as just described. In shop practice the stretchout line is placed directly upon the sheet metal, the measurements being taken from the elevation and placed thereon by means of the compasses or dividers.

To illustrate: Let S¹ S² S³ S⁴, in Fig. 99, represent a piece of sheet iron upon which is drawn the stretchout line, as shown from F¹ to G¹, and through the small figures thereon the usual measuring lines are drawn. Extend the stretchout line G¹ F¹ as shown to F². Now measure the distance from the line F¹ F² to where the line 1 cuts the miter line Y Z, and transfer the distance to the sheet metal on the lines 1, 1, measuring from the line F¹ G¹.

Then again measure the distance of the line 2, commencing on the line F¹ F² in elevation, to where line 2 intersects the miter line Y Z, and transfer this distance upon the line 2 2 on the sheet metal, measuring from the line F¹ G¹. In this way all the points will be transferred to the sheet metal, thus completing the pattern N O M L, as shown in Fig. 99. A lap for riveting is allowed, as shown. To obtain the pattern for the opening D¹ E¹, Fig. 99, proceed as follows: At right angles to B¹ E draw the line P R indefinitely, upon which place one-half of the stretchout of the larger circle B, as shown by the small figures from 7 to 7 on the stretchout line P R. It will be noticed, by referring to the plan, that the spaces 1 and 7 of the smaller pipe C intersect the larger pipe B on one line, and is indicated on the profile B, as shown by 1 7′. In the same manner do the spaces 2 6 and 2 6 and 3 5 and 3 5 of the circle C intersect the larger circle B on separate lines, and are indicated on the profile B by 2 6′, 2 6′ and 3 5′, 3 5′ respectively. Therefore are the figures 5′, 6′, 7′, 6′, 5′ placed over the figures 3, 2, 1, 2, 3 on the stretchout P R, corresponding to the numbered spaces on the profile B in plan. Now at right angles to the stretchout line, and through as many points in the stretchout as correspond to the points of the smaller pipe C, intersecting the larger pipe B as shown in plan, drop lines from the stretchout P R, as shown, which intersect with lines of corresponding numbers drawn at right angles to B¹ E or parallel to P R from the miter line D¹ E¹. A line traced through these intersections, as shown by U V X W, will be the required opening to be cut in the larger pipe B, and on to which the pipe F shown in front elevation will miter. At V¹ W¹ in Fig. 99 is shown the method of putting a flange on the elbow C¹ D, placing the flange on the inside of the larger pipe E, either soldering or riveting, as shown.

It will be noticed that P R S T in Fig. 99 represents but one-half of the larger pipe B, as shown in plan. After the half pattern is completed as shown, and the opening U V X W cut out, turn over the pattern on the line P S and trace the pattern on the other side, including the opening U V X W, omitting the lap shown from T to R, which will then be the complete pattern desired.

Patterns for T-Joints, Square Pipes.

In Fig. 100 is shown the method of connecting two eave troughs into one leader by means of a T-joint. In Fig. 101 is shown the plan and elevation of a T joint, the section of the pipe being square, also the method of obtaining the patterns.

Let B C D E G F, Fig. 101, represent the front elevation of a T joint, made to any given angle, shown by A B C, Fig. 100. Let W represent the plan view of the larger pipe and X the plan view of the smaller pipe; draw the plan and elevation in their proper relative position and let the seam be placed at A¹ in plan for the larger pipe W and at A in plan for the smaller pipe X. Now at right angles to A¹ A² in the plan, Fig. 101, draw lines from the corners of the profile X, cutting the side of the profile W, as shown at 1 4 and 2 3, corresponding to the figures on the corners of the smaller pipe or profile X. As the seam is to be placed at A in the profile X, plan view, as before explained, it will be necessary to obtain this point in elevation from which to obtain the line of the seam on the elbow patterns. Therefore parallel to A¹ Z, Fig. 101, drop a line from the seam A in the profile X, cutting the miter line H I in the elevation. From the intersection obtained on the miter line H I draw a line parallel to the line of the pipe I K, cutting the side of the larger pipe in elevation, as shown at J¹. To obtain the pattern for part of the elbow F proceed as follows: At right angles to A¹ Z draw the line A² A², upon which place the stretchout of the smaller pipe X in plan, commencing at the seam A, as shown by the small figures on the stretchout line A² A².

At right angles to A² A² draw lines indefinitely from the small figures in the stretchout, as shown, which intersect with lines of corresponding numbers draw at right angles to A¹ Z, or the lines of the pipe, from the miter line H I. A line drawn through these intersections, as shown from P to R, will be the required pattern for one arm of

the elbow shown at F. For the pattern of the arm of the elbow shown at G proceed as follows: At right angles to the lines of the pipe K I or J H, front elevation, Fig. 101, draw the stretchout line A^3 A^3 indefinitely, upon which place the stretchout of the smaller pipe X, shown in plan, commencing at the seam A, as shown by the small figures upon the stretchout line A^3 A^3. At right angles to A^3 A^3 and through the small figures draw lines indefinitely, as shown, which intersect with lines of corresponding numbers drawn at right angles to the lines of the pipe J H or K I from the miter line H I at the top, and J K at the bottom. A line drawn through these intersections, as shown by S U V T, will be the required pattern for the arm of the elbow shown at G. To obtain the size of the opening J K which will be cut on to the larger pipe shown by B C D E in elevation, Fig. 101, proceed as follows: At right angles to A^1 Z draw the stretchout line A^4 A^5, upon which place the stretchout of half of the profile W, shown in plan, commencing at the seam A^1, as shown by the small figures upon the stretchout line A^4 A^5, the numbers 3 2 and 4 1 on the stretchout A^4 A^5 corresponding to the numbers showing the intersections of the smaller pipe X on the side of the larger pipe W. At right angles to A^4 A^5 drop lines from the small figures, as shown, which intersect with lines of corresponding numbers drawn at right angles to the lines of the pipe B D or C E from the miter line J K, as shown. A line drawn through these intersections, as shown by L M N O, will be the opening required. A lap is allowed for riveting, as shown. It will be noticed that A^4 A^5 B^1 C^1 represents but one-half of pattern of the larger pipe shown by W in plan. For the entire pattern simply turn over the half pattern on the line A^5 B^1, transferring the dots, as shown, which indicate the bends, and omitting the opening L M N O and the lap for riveting. It should be understood that by placing the elbow F G, Fig. 101, on the other side of the pipe D E C B, a Y joint would be the result, the same as shown in Fig. 99, with the exception that the pipe is round in Fig. 99 and square in Fig. 101.

[THE END.]

The Iron Roofing Trade.

The lively movement in the iron and steel roofing trade caused by orders being placed for shipment to Western points before the recent advance in freight rates has quieted down, and the business is as dull as other branches of the iron and steel industry. Recently quite a number of concerns have engaged in the manufacture of specialties. The Cambridge Roofing Company, Cambridge, Ohio, have added a lot of new improved machinery for the manufacture of galvanized conductor pipe, and are doing a fair business in this line, and other manufacturers of the same material are kept busy, thus helping to keep up a steady demand for galvanized sheets, which are now growing scarce in the market. The demand for roofing sheets and corrugated iron continues fair, and some makers are seeking places where supplies of sheets can be secured, but the majority have enough stock on hand for their requirements and are not inconvenienced by the shortage caused by stoppage of sheet mills due to the coal miners' strike. The Berger Mfg. Company, Canton, Ohio, have recently introduced many new designs in steel ceilings and siding, and other sheet metal working concerns are turning their attention to this class of work.

FLASHINGS.

FRED. HARTMAN, 143 Wells street, Chicago, is to furnish the galvanized iron cornice work for the residence of Charles Niemann, Diversey place; flat building of Dr. G. H. Fricke, Halsted street and Buckingham place; store and flat building of A. H. Rendtorff, North avenue, and Casaretto flats, West Indiana street.

A RECENT ISSUE of the *Times*, published at Bethlehem, Pa., contains an article reviewing the history of the Slatington-Bangor Slate Syndicate of Slatington, Pa. Among other things the article states that the shipments of the company for May of this year were 141 carloads, containing 8336 squares of roofing slate, making a total since January 1 of 20,421 squares. For the corresponding period of last year 10,806 squares were shipped by the syndicate. While the situation is not altogether encouraging there is a fair demand for slate, which indicates more or less building activity in some sections of the country. Nearly all the quarries of the syndicate are running on full time, and the outlook is reported good for a large trade this season.

Building Trades Exhibition a Success.

The first annual Chicago Building Trades and Material Exhibition, which has just closed at the Institute of Building Arts, 63 to 69 Washington street, Chicago, was a success in every particular. A large and constant attendance of interested visitors attested the appreciation with which the exhibition was received by the public, and the 200 exhibitors expressed themselves as very much gratified with the work accomplished. The exhibits covered a wide range of building materials and devices, embracing everything necessary to the health, comfort and convenience of man in connection with the construction of buildings.

Exports of copper during April and in the ten months ending April 30 are stated as follows in the last monthly report of the Bureau of Statistics:

	Ore.	
	1894. Tons.	1893. Tons.
In April	291	3,673
Ten months	23,302	33,008

	Ingot.	
	1894. Lbs.	1893. Lbs.
In April	11,055,135	3,084,407
Ten months	168,898,854	24,411,939

The distribution of ingot during the ten months was as follows:

	1894. Lbs.	1893. Lbs.
To United Kingdom	61,069,038	2,308,259
To Germany	21,164,702	2,863,142
To France	26,619,864	9,769,766
To other Europe	53,427,139	9,261,520
To other countries	617,311	209,252

The Bronson Supply Company, 72 Beekman steet, New York, contemplate establishing a London office for supplying the European and British colonial trade with their line of House Furnishing Goods, and at the same time they are making preparations to represent manufacturers of kindred lines of Hardware. The articles in which they intend establishing a foreign trade will include, besides Hollow Ware, Stamped and Pieced Tinware, Copper Ware, Hardware novelties in the line of Kitchen and Household Utensils, Wooden Ware, Wire Goods and Plated Ware. They will also handle a limited number of standard articles, such as Skates, Locks, Oil, Gas and Gasoline Stoves. The Bronson Supply Company request that manufacturers of the above lines of goods who wish to negotiate for representation abroad communicate with them.

The Dry Closet System.

The Board of Health of Syracuse, N.Y., recently held a meeting to hear reports on the dry closet systems used in their schools, which have been carefully investigated by Health Officer Doctor Totman and a committee from the Heating, Ventilating and Sanitary Association of Syracuse, consisting of William A. Tobin, R. C. McClure, F. H. Moore of the Howard Furnace Company, B. Joseph O'Donnell, E. C. Moses of the J F. Pease Furnace Company, E. P. Bates and Edward Joy. The association's committee came before the board with a statement of what they found in an investigation of Montgomery and other schools of the city.

"Montgomery School.—The vaults for the so-called dry closet system were filled with a putrid mass of night soil and liquid 20 inches deep. Over each of these vaults, two in number, are located the two classrooms of the primary department, each containing 48 sittings and occupied by about 80 scholars. Each of these two rooms are provided with two ventilating exits in the shape of face plates located in the floor. These exits, which open into foul air shafts or chambers to ditch, are connected to and open into the said vaults. In each case one of these face plates exits opens into the foul air chamber directly over the putrid mass of liquid night soil above referred to. All the shafts for drawing foul air from the classrooms of the school open into these two vaults. We found upon examination that in the rooms on the second floor, over the vaults, the foul air ventilating exits were operating contrary to the intention and that they were throwing foul air into the rooms instead of exhausting it. Some of the air being thrown into the rooms had passed through the vaults hereinbefore mentioned. According to statements made by persons in the building these conditions have existed more or less during the past season. The teacher stated that they have been obliged to open the windows to obtain pure air. We were informed by the janitor that he had attempted to burn out the excreta deposits with the aid of oil. He stated that he had used 30 gallons of oil in one vault without success and had failed to consume the matter in the other vaults, using more or less oil."

Their statement of the condition at other schools showed but little difference, and on motion of Commissioner Schwarz the Montgomery School in its present condition was declared a nuisance, and the Health Inspector was ordered to abate it.

The official statistics of imports and exports for the ten months of the fiscal year ending April 30, 1894, show a falling off of $123,500,000 in imports into the United States, as compared with those of the corresponding period of last year. Exports, in the same time, increased over $53,500,000. The figures given are as follows: Imports in 1893, $354,213,427, and in 1894, $230,719,588 Exports in 1893, $701,036,375, and in 1894, $754,606 522.

STOVE TRADE NOTES.

The Richmond Stove Company,

with office and works at Twenty-fifth and Main streets, Richmond, Va., have issued an exceedingly attractive volume of nearly 100 pages, relating to cook stoves, ranges, heaters, hollow ware, grates, fenders, &c. The pages are of large size, permitting the use of cuts of liberal proportions. The descriptive text points out the important features of construction and gives the various sizes in which the goods are made, the dimensions of ovens, diameter of pipe required and prices. The printing is in colored ink, while in connection with some of the heating stoves red is employed to indicate the glow of the fire through the mica sections. The company have made some important additions to their line since the last issue of their catalogue, and the statement is made that in the construction of the goods they use iron made from native ores. Among the goods shown may be mentioned the Improved New Lee cook stove, the Kenmore, New Patron, Piedmont, Seminole, Dispatch, New Gordon, Wenonah and the Virginia Air Tight. The ranges are represented by the Richmond, a substantial six-hole construction of attractive ornamentation made in various styles and sizes; the Lee, shown in several varieties; the Favorite, for brick setting; the Roanoke, Dorcas and Ariel. The heaters include the Sultan, a new direct draft self feeder for coal; the New Avondale; the Melrose, a cottage parlor for wood or coal; the Radiant, an attractive Franklin; the Comfort, a neat Todd for wood; the New Dixie, a box stove; the Longdale, a heavy cannon; the Iron King, shown with and without heating drum; the Richmond Oak, a new heater made in five sizes for wood or coal, and the Pluto, a cannon stove made in four sizes. The closing pages of the catalogue are given up to illustrations and prices of grates, fenders, hollow ware, fire brick, &c. An interesting feature is the presentation of skeleton cuts of a cook stove and range, the various parts being numbered in such a way as to facilitate the ordering of repairs. The binding of the catalogue is in embossed covers, the design appearing in old gold and green upon a wine colored ground.

ODD PLATES.

NEGOTIATIONS have been in progress for some months between Emerson McMillin & Co., 40 Wall street, this city and certain of the large vapor and gas stove manufacturers of Cleveland, St. Louis and Chicago, looking to the acquisition of these properties by the United Vapor & Gas Stove Company, who have recently been organized under the laws of the State of Illinois, with a capital stock of $8,500,000. The negotiations are not yet concluded, but the progress of affairs will be watched with interest by the trade.

QUITE a number of Western stove foundries have been obliged to suspend operations recently because they ran out of coke. The coal miners' strike continued long enough to affect these foundries, but it was a much longer pull than had been expected.

THE FAVORITE STOVE & RANGE COMPANY of Piqua, Ohio, are calling attention to their specialties offered under the name Favorite, by means of a little pamphlet entitled "Col. Tompkins' Story." This is told in verse, illustrated by means of numerous engravings. The printing is in colors, and the style and make up of a pleasing character. The last page of the cover gives a bird's-eye view of the company's works at Piqua.

THE STOVE MOUNTERS of Philadelphia have formed a local union under the jurisdiction of International Union No. 6, and have elected H. G. Halbe president, Jacob P. Rothfuss treasurer, and James P. Donnelly secretary.

THE DETROIT STOVE WORKS, Detroit, Mich., have just made a shipment to Frankfort, Germany, of 35 Jewel base burners, and have an order on file for future shipment of goods to Constantinople.

DR. EDWARD KIRK, 1208 Vine street, Philadelphia, Pa., publishes a neat pamphlet on "Constructing a Cupola," which contains much practical information for those who have need of such a furnace. The pamphlet will be sent free on application to Dr. Kirk.

THE THATCHER FURNACE COMPANY are now settled in their new five-story brick building at 240 Water street, where they enjoy greatly improved business facilities as compared with their old location at 32 Peck slip. On the first and second floors of the building are found an excellent display of furnaces and hot water heaters, while the third floor is set apart for ranges in portable form and brick set. The fourth and fifth floors are given up to workshop purposes. The entire building is lighted by electricity, over 200 incandescent lamps having been installed. During the past week the company have shipped to their agents in the West many carloads of furnaces and ranges.

C. EMRICH of Columbus, Ohio, has recently made some improvements in connection with his Brilliant Florence Round Oak, which is offered the trade in five sizes. He has increased the hight of this stove by extending the drum about 15 inches. The nickel trimmings have also been altered in some respects, giving, it is claimed, much more satisfactory results. Two sizes of a new four-hole range, made right or left hand, have been brought out and the Prize Florence four-hole cook stove, as well as the Queen Florence, have been remodeled. The concern are now fully equipped with a complete line of medium priced stoves of new pattern and modern design.

CHARLES E. COLEMAN, representing Eugene Munsell & Co., 218 Water street, New York, has recently returned from a six weeks' trip through the Eastern and Western States, where he called upon stove dealers, hardware jobbers and manufacturers of electrical goods. We understand that Mr. Coleman will soon visit his many friends in the stove trade in the New England States and also in the State of New York.

THE PORTLAND STOVE FOUNDRY COMPANY of Portland, Maine, have brought out a new medium priced range known as the Ideal Atlantic. It is of attractive appearance, embodies the modern features of convenience and utility and is designed for a leader, to sell in the same class as the highest grade goods, but at a lower price.

THE MAGEE FURNACE COMPANY, 32 to 38 Union street, Boston, Mass., are distributing a unique advertising novelty entitled "The Great Columbus Egg Puzzle." It consist of a round pasteboard box, about 2¾ inches in diameter and ¾ inch deep, in the bottom of which is a small hole. The box contains a wooden egg of such a size that it will go partially through the hole. The puzzle is to make the egg stand in an upright position in the hole without touching it. The bottom of the box carries an inscription calling attention to the puzzle and also to a new range which the company have brought out, known as the Magee Grand. This is referred to as "the finest cooking apparatus that has ever been made." The cover of the box is embellished with a colored picture in which Columbus is a prominent figure.

STUMPF & THIELE, 19–21 North Tennessee street, Indianapolis, Ind., have issued an illustrated circular showing the Tropic base heating steel furnace, for use in residences, churches, halls, stores, &c. It is made in three sizes, known respectively as Nos. 25, 31 and 37. The manufacturers also call attention to their Sanitary school room heater and ventilator, of which two sizes are made. The claim is made that by its use a "constant change of air is obtained in the room by the introduction of a volume of fresh air from outside through the heater, and the ejection of foul air from the room, taken from the lower currents in the room through the ventilators."

THE SANFORD HEATING COMPANY, represented by L. V. Sanford, 113 Beekman street, this city, have been appointed agents for the sale of the goods manufactured by the Kelsey Furnace Company of Syracuse, N. Y. The furnaces of this concern have established a gratifying reputation in the trade by reason of their durability, large, heating surface and economy of fuel. Mr. Sanford has been brought up in the stove business and is considered an authority on matters pertaining to heating and ventilation.

THE MARCH-BROWNBACK STOVE COMPANY of Pottstown, Pa., have just placed on the market a new soft coal furnace as an addition to their well-known line of Crown furnaces. The new furnace consumes its own smoke, this being effected by means of a current of air which is taken in at the front

of the furnace and distributed in the fire. The furnace is made in the three larger sizes and two styles, portable and brick set.

Evans & Co., formerly located at Peck slip and Front street, have leased the building 119 Beekman street, this city, where they will carry a full line of stoves and ranges manufactured by the Lebanon Stove Works, at Lebanon, Pa., for whom they are agents. The firm also represent Luther & Lederhos of this city, and will carry a full line of their gas stoves and ranges.

Manager Hull of H. Rendtorff & Co., Chicago, reports a sale of a carload of stoves for immediate shipment, and all of one kind. There is no doubt about it, for he exhibits the documents to prove it. This interesting event is mentioned because it had been supposed that carload orders were events of the misty past.

The Magee Furnace Company, Boston, Mass., are sending the following letter to their patrons: "J. Q. A. Butler having severed his connection with our New York branch, our business there will be conducted in the future by J. M. Sweeny as manager, at 242 Water street, as heretofore. Wm. H. Mason will continue in charge of the retail furnace department."

"One Hundred From Many Thousands," is the title of the Eastern edition of a pamphlet of testimonials relative to Splendid and Stewart stoves, just issued by the Fuller & Warren Company of Troy, N. Y. There are 30 pages of letterpress wholly devoted to these letters, which come from dealers in the Eastern section of the country who have handled the goods named. The communications are of a highly complimentary character and indicate in no small degree the measure of success which the Stewart and Splendid stoves have achieved.

It may have been accidental, but it looked intentional. At all events the buyer thinks so if he now knows the circumstances. During the recent cold spell, which seems ever so long ago, the writer dropped into a store for the sale of oil heaters. One of them was in full blast. Resplendent in nickel, and with the glowing flame showing through the large mica panes, it was a sight to cheer the eyes on such a chilly morning. In dropped a customer who was attracted by the beauty of the stove, and then took a position in front of it so that he could more readily examine its construction. "Jerusha!" said he, "does it throw out that much heat?" "Yes, always," said the gratified salesman, proceeding to dilate upon its superior powers of air circulation. The customer ordered one forthwith and instructed the salesman to send it to his house immediately to comfort his wife, who didn't want to buy more furnace coal and was trying to brave out the discomforts of the late spring. The cause of the buyer's enthusiasm was discovered after he had gone out. He had been standing immediately in front of a register through which a Sturtevant blower was forcing heated air with all the energy of which it was capable, and had evidently assumed that the heat he felt was due to the terrific power of the stove before him. The beatific smile on the salesman's face when he perceived the combination that had so signally aided him was a sight to make a fallen angel weep.

Rathbone, Sard & Co. have received in their Chicago office, corner of Wabash avenue and Randolph street, the originals of the letters patent covering the construction and design of their Acorn radiator. These patents are dated January 23, 1894, and March 13, 1894, the first covering design and the second construction. They take pleasure in showing these patents to those who are interested in the matter. They will issue licenses to other manufacturers who may wish to use the principle on which this stove is constructed, but retain the design exclusively for their own stoves.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

The Board of Supervisors of Ontario County, N. Y., have passed an appropriation of $25.000 for the erection of a Sheriff's residence and jail, which will have a system of heating and plumbing.

The contract for steam heating of the new school house at Dovlestown, Pa., has been awarded to Thomas Craig of Trenton, N.J. The contract price is $1690.

The contracts for the heating, plumbing and ventilating of the two new school buildings at St. Paul, Minn., have been awarded by the Board of Education. The board awarded the contract for the plumbing to W. W. Sykes & Co. for the Van Cleve and Douglass buildings at $1432 each. The contract for the heating and ventilating of the Van Cleve Building was given to Pond & Naset for $5200, and for the Douglas Building to Turnsted & Moore for $5698.

Edward H. Barry has been awarded the plumbing contract for the new Gaulin Avenue School House at Woonsocket, R. I.

The Board of State Prison Commissioners of the State of Montana will, until June 28, 1894, receive sealed proposals and bids to equip the Eastern State Prison at Billings, Montana, with steam heating plant. All proposals must be addressed, "Board of State Prison Commissioners, Helena, Montana," and marked, "Sealed Proposals and Bid, by (giving the name of the bidder)." A bond of $5000 will be required of the successful contractor.

The town meeting of Springfield, Mass., has appropriated $1000 for heating the Town Hall.

H. A. R. Dietrich, Bethlehem. Pa., is putting the heating plant in A. L. Colby's new building, Fountain Hill. Mr. Dietrich is also at work on plans for work on several new buildings, and his Hellertown works are busy turning out boilers.

Orange, Mass., is to build a new school house to cost $24 700, exclusive of the heating and plumbing. James A. McKenna has the contract.

Sealed proposals will be received by T. H. Titus, secretary of the Board of Trustees of the Minnesota State Hospitals for the Insane, at the West Hotel, Minneapolis, Minn., until 1.30 p.m., July 6, 1894, for a plant for heating and ventilating the northeast wing of the Fergus Falls State Hospital for Insane; plans and specifications to be submitted by each bidder. Sealed proposals will also be received for plumbing said building. He will also receive at the same time and place bids for heating and ventilating the Administration Building for the Rochester State Hospital for Insane.

The contract for supplying the ventilating apparatuses and the steam disinfecting apparatus for the Contagion Hospital has been awarded by the Sanitary Committee of the city of Harriaburg, Pa., to the Raymond & Campbell Mfg. Company of Middletown, Pa. The steam for the disinfecting apparatus will be supplied from a No. 2 Lindemuth steel boiler.

The Alberene Stone Company, agents for the Smith & Anthony Company, 217 Lake street, Chicago, report the following new buildings in which the Hub warm air furnaces are to be placed: Five houses of F. H. Kirkham, Sunnyside avenue and Robey street, Ravenswood; two houses of D. R. Cannon, Ravenswood; residence of H. Neugard, Rogers Park; residence of D. J. Slayton, Argyle Park.

J. J. Wade & Son, 276 Dearborn street, Chicago, are to do the plumbing, gas fitting and sewerage in the Kent Building, corner of Franklin and Van Buren streets; also the plumbing, gas fitting and sewerage in the Hale Building, corner of State and Washington streets. The Wade system of sewerage is to be used in each of the buildings.

Among the contracts recently taken by the John Davis Company, 69 to 79 Michigan street, Chicago, can be mentioned the following: Steam heating plants for the new school building on Thomas street, and warehouse of A. E. Kent & Sons, Franklin and Van Buren streets; power plant for the New England Engineering Company's electric light plant, at Edgewater. The company have also furnished supplies for the water works at Ottawa, Ill., and several carloads of pipe to be used on the Chicago drainage canal.

Kehm Bros. & Mertz, 289 East Kilzie street, Chicago, are to install a steam heating plant for the Illinois Condensing Company, Forty-seventh street and Vincennes avenue.

Proposals for heating the North School House in independent school district of Indianola, Iowa, by steam, will be received by E. W. Hartman, secretary Board of Directors, Indianola, Iowa, until June 22, 1894.

Stoneham, Mass., has purchased and will remodel the Armory Building and put in a steam heating plant.

Vicksburg, Miss., is to have a new $10,000 school building, with a modern ayatem of heatiug and ventilation.

The March-Brownback Stove Company of Pottstown, Pa., are supplying one of their style B No. 30 Crown steam heaters for William Blackburn's hotel, at Ambler, Pa. Grant, Jenkins & Co. of Lonsdale, Pa., are installing the heating plant.

Among the contracts recently taken for plumbing, gas fitting and sewerage by C. J. Boyd, 4725 Union avenue, Chicago, can be mentioned the following: Flat building of Miss McConvill, Emerald avenue and Forty-third street; flat building of D. Lynch, Union avenue and Forty-fourth street; flat building of John Sampson, Aberdeen and Fifty-fourth streets; flat building of James Kennedy, Sangamon and Sixty-fourth streets.

J. H. Roche, 210 Thirty-first street Chicago, has the contract for the plumbing, gas fitting and sewerage in the flat

building of Inspector Nicholas Hunt, Monroe and Fifty-eighth streets.

J. J. Doyle, 6040 Halsted street, Chicago, is to furnish the plumbing, gas fitting and sewerage in the eight-flat building of H. C. Saxe, Halsted and Sixty-first streets.

Proposals will be received until June 20 by the trustees of St. John's Church, Michigan, Ind., for steam heating and also for water heating for St. John's Church and St. John's Parochial School buildings.

The Manufacture of Briquette Fuel.

At a recent meeting of the Institution of Civil Engineers a paper on this subject was read by William Colquhoun. The paper contained a description of the various English and Continental methods of agglomerating slack coal, which has now become an important and increasing industry and opens up an outlet for large quantities of small coal hitherto lost on the pit bank or in the workings. Various agglomerating agents are detailed and their local advantages discussed; the characteristics of good pitch derived from coal tar render that agent, however, in every way the most suitable. By the use of from 8 to 9 per cent. of pitch, slack coal may be agglomerated into a form eminently suitable for storage purposes, water proof, incapable of deterioration on exposure, of cohesion greater than the large coal from which it is derived, and, finally, having calorific qualities nearly equal to large coal. In support of the latter contention the author cites the results of three experiments with English briquettes, which gave 8.41 pounds, 8.77 pounds and 8.99 pounds, respectively, as the weight of water evaporated from and at 212° F. per pound of fuel. The average evaporative power of several of the best Welsh steam coals was 9.33 pounds. Careful experiments made by Mr. Marié on the Paris, Lyons & Mediterranean Railway gave as corresponding figures for three descriptions of French briquettes, 8.88 pounds, 9.15 pounds and 8.68 pounds, respectively.

The mechanical preparation of the coal used in briquette manufacture receives more attention on the Continent than in England, particularly in regard to the washing and subsequent drying of the slack. These operations are necessary in order to render the poorer coals serviceable for the manufacture. The draining and drying appliances in use are described, particularly those of Jacoby of the Molière Collieries, and of Biétrix, the latter being described in detail and instances given of the working cost. The coal and pitch are intimately intermixed by two methods, known respectively as the melted and dry pitch processes, the pitch by the former being melted, sometimes with additions of common tar, prior to its addition to the coal, and by the latter being ground up with the coal in a dry state. Several examples are given of the procedure in each case. In both instances the mixture of coal and pitch is subjected to the action of heat until each particle of coal is covered with a film of melted pitch, and so rendered fit for compression into blocks. In this state the mixture or paste contains from 3 to 5 per cent. of water in order to facilitate the sliding of the particles of coal one on the other during compression.

The machines for compressing the paste are roughly divided into three classes, irrespective of the nature of the power employed. These classes are: 1. Single compression machines, illustrated by detailed descriptions of the Mazeline, Stevens and Dupuy presses. 2. Machines compressing on both sides of the briquette, such as those of the Middleton, Biétrix and Veillon. 3. Machines acting by the tangential pressure of rolls, like that of Fouquemberg and those of the sausage machine type, such as the Bourriez press. Briquettes hot from the press have an inconsiderable cohesion and have to be treated with care in stacking and loading, and arrangements made to keep down the cost of labor. Costs were given of making briquettes in works in England, in the North of France and in Belgium, the cost of labor, fuel, supplies and maintenance, not inclusive of the cost of material agglomerated, being 2 shilling and 1½ pence, 1 shilling and 9 pence and 2 shillings and 6 pence, respectively.

Instances were cited of the suitability of the same process for the agglomeration of charcoal dust, sawdust, coke breeze, friable iron ores and cement.

Southern Pig Iron Freights.—The Queen & Crescent Route has issued east bound pig iron tariff No. 6, effective June 15, giving rates on pig iron in car load lots from Southern furnaces to the following points:

To	From Dayton and Rockwood, Tenn.	Chattanooga, Tenn.	Rising Fawn, Ga., and Fort Payne, Ala.	Birmingham district.
Connecticut (all points).	$5.00	$5.25	$5 50	$5.50
Wilmington, Del	4.27	4 27	4.52	4.52
Maine (all points)	5.00	5.25	5.50	5.50
Baltimore, Md. (rail and water)	3.54	.....	3.50	3.50
Baltimore (all rail)	4 00	4.01	4.11	4 11
Washington, D. C	3 76	3.76	4.01	4.01
Massachusetts (all points; all rail)	5.00	5.00	5.50	5.50
Boston (rail and water)	3.89	....	3.85	3.85

Scranton, Pa	4.20	4.45	4.70	4.70
Rhode Island (all points; all rail	5.00	5.25	5.50	5.50
Providence, R. I. (rail and water)	3.89	....	3.85	3.85

*In addition to above charges the cost is as follows: In lots of 50 tons and less, 60 cents per ton; over 50 tons, 50 cents per ton.
†The above rates cover pier delivery only. Additional charge within lighterage limits is as follows: In lots of 50 tons and less, 60 cents per ton; over 50 tons, 50 cents per ton.

The all rail rate on the Louisville & Nashville Railroad is $5 39 from Chattanooga to Boston. The rate from Big Stone Gap, Va., to Harrisburg is $3.06. To Newark, N. J., it is $4.87 from Birmingham, $4.62 from Chattanooga, and $4.12 from Big Stone Gap. The all rail New York rate is $5.10 from Birmingham, $4.85 from Chattanooga and $4.35 from Big Stone Gap, Va. The all rail rate to Philadelphia is $4 52 from Birmingham, $4 41 from Chattanooga, and $3.91 from Big Stone Gap.

TRADE REPORT.

The Iron Market.

The question which is foremost with the trade is whether the settlement of the Coal and Coke strikes when effected will lead to a relapse. The principal argument in favor of the maintenance of a range of prices higher than that of spring is that stocks have been pretty well cleaned up. In Iron as in other staples the country was never so bare.

A second point usually raised is that costs have advanced. That is true, but unfortunately the advance is not very large. It seems pretty certain that Coke for delivery during the second half of this year has been sold at $1.25. Since the majority of furnacemen will find their low priced contracts at an end soon, it looks as though that figure might be established.

A third argument is that during the troubles a good deal of work has been postponed, for which material must be bought. We are inclined to believe that this is overrated, since a prolonged stoppage generally kills a good deal of business outright.

Thus far there are few indications to show how matters will turn. For delivery during the next three or four months $11 @ $11.25 is being asked for Bessemer Pig in the Valleys. But buyers have not worked themselves up to that pitch yet, and the situation is not clear. The prices at which Bessemer is held have encouraged preparations to start some outside idle plants and have caused some furnaces which run on Foundry Iron usually to switch off on Bessemer. This looks as though there is a fair profit in the latter.

Chicago appears to be the most active market in some of the leading lines. Our correspondent notes sales of about 20,000 tons of local Coke Foundry, and states that there has been a good deal of activity in Bars. A number of season contracts have been placed, but at low prices.

Throughout the East the demand in every line continues exceedingly slow. In fact, the indifference of buyers in the face of threatened scarcity has been phenomenal. It looks as though no movement in values can be expected until high temperatures in Washington have driven our legislators home.

In the New York market the demand continues moderate, and is covered quite readily at old prices. The new rates of freight go into effect on the 15th. The rail and water rates to leading points from Southern furnaces are still very low. We quote standard brands $12.50 @ $13 for No. 1; $11.25 @ $12 for No. 2, at tidewater. Southern Iron, same delivery, $11.50 @ $12.25 for No. 1; $10.50 @ $11 for No. 2; $10 @ $10.25 for No. 3; $10.25 @ $10.75 for No. 2 Soft, and $10.50 @ $11 for No. 1 Soft. Foundry No 4 (Foundry Forge) is $9.75 @ $10.25.

Advices from Philadelphia indicate that in that market there is a pretty fair demand for low grade Irons at about $10.25 @ $10.50 and of standard brands of Foundry No. 2 X at $11.50 @ $11.75, but it is very hard to get beyond these limits, notwithstanding the comparative light supply and the higher cost incident to higher freights. Consumers, however, show no desire to buy in excess of their own requirements, for which reason sellers are not crowding the market, leaving it to later developments to decide whether prices shall be advanced or not. Quotations for deliveries at Philadelphia or nearby points are about as follows :

Standard No. 1 Foundry X....	$12.50 @ $12.75
Standard No. 2 Foundry X...	11.50 @ 11.75
No. 2 Plain.....	10.75 @ 11.00
No. 1 Soft....	11.50 @ 11.75
No. 2 Soft....	10.75 @ 11.00

The special feature of the week in the Chicago district was the marked activity in local Coke Iron. Sales aggregated close to 20,000 tons, and a heavy inquiry continues. The improvement is not ascribed by dealers to any increase in consumption, but to the general anticipation by foundrymen of higher prices on account of the scarcity of fuel and the cleaning up of Pig Iron stocks. They are anticipating their wants much more freely than at any time for the past two years. Furnace companies are, however, not disposed to sell as freely as foundrymen would buy. They are limiting deliveries to the remainder of their care, and in many cases are endeavoring to cut down the quantities desired. Prices are very firm and in some cases an advance is asked and obtained. Southern Coke steadily grows scarcer and prices are stronger. Quotations on Southern brands are now made only on carload lots for immediate delivery. The furnace companies are not disposed to sell for delivery far into the future, in view of the expected increase in cost of production and advances in freight rates. Quotations are given as follows for cash:

Lake Superior Charcoal.....	$15.00 @ $15.50
Local Coke Foundry, No. 1...	11.25 @ 11.50
Local Coke Foundry, No. 2...	10.50 @ 11.00
Local Coke Foundry, No. 3...	10.00 @ 10.50
Local Scotch.....	11.50 @ 11.75
Ohio Strong Softeners No. 1..	13.00 @ 13.50
Southern Silvery, No. 1.	..... @ .....
Southern Silvery, No. 2.....	..... @ .....

The Pittsburgh market is reported as being absolutely featureless, there being no demand for spot Iron, and nothing doing in the direction of contracts for late delivery. Mill and Foundry Irons are very dull in demand, but prices continue firm. A sale is noted of 100 tons No. 1 Foundry at $11.50, and one of 100 tons No. 2 Foundry at $10.75, Pittsburgh. For close delivery the following prices are ruling:

No. 1 Foundry..	$11.50 @ $11.75, cash
No. 2 Foundry.....	10.75 @ 11.00 "

There is a stronger undertone in the Cincinnati market. While there has been little more than a jobbing demand during the week it was more general in this district and from the East and supplies are so much reduced that many of the Southern furnaces are not offering the grades most in demand at any price, and while they have generally sold Nos. 1 and 2 Foundry Coke Iron to the extent of the demand at previous prices, they demand an advance on No. 3 Foundry. Quotations are unchanged, but are scarcely more than nominal, as follows:

Southern Coke, No. 1.....	$10.25 @ $10.50
Southern Coke, No. 2.....	9.25 @ 9.50
Southern Coke, No. 3.....	9.00 @ 9.25
Ohio Soft Stone Coal, No. 1....	14.50 @ 15.50
Ohio Soft Stone Coal, No. 2....	14.00 @ 14.50
Lake Superior Coke, No. 1.....	12.50 @ 13.00
Lake Superior Coke, No. 2.	11.50 @ 12.00
Hanging Rock Charcoal, No. 1..	17.00 @ 17.50
Hanging Rock Charcoal, No. 2..	16.50 @ 17.00
Tennessee Charcoal, No. 1.....	13.00 @ 13.50
Tennessee Charcoal, No. 2.....	12.00 @ 12.50
Standard Southern Car Wheel	16.25 @ 17.00
Lake Superior Car Wheel and Malleable.....	16.25 @ 16.75

An increasing scarcity in No. 1 Foundry, with a tendency to advance the price of this grade, is the only feature of interest in the St. Louis Pig Iron situation. Nos. 1 and 2 Soft Irons are also hard to obtain, but prices are unchanged. Quotations as follows for cash, f.o.b. cars St. Louis :

Southern Coke, No. 1 Foundry.....	$11.00 @ $11.25
Southern Coke, No. 2 Foundry	10.00 @ 10.25
Southern Coke, No. 3 Foundry.	9.75 @ 10.00
Southern Car Wheel.....	17.00 @ 18 00
Lake Superior Car Wheel..	16.25 @ 16.50
Ohio Softeners.....	14.25 @ 14.50

Metal Market.

Pig Tin.—The consumptive demand for Pig Tin, like that for other metals, has been very tame of late, while port statistics show more or less considerble addition to the surplus supply. Arrivals at foreign ports have also been quite heavy, and while more or less shifting of stock has taken place the visible supply for this country and Europe is kept at about 19,000 tons, or above the average. In other words, there is abundance of Tin on the market. Moreover, there is a growing conviction that the speedy passage of the new tariff bill, which abolishes the duty on Pig Tin, is certain. These causes combined have served to depress prices, which have dropped during the week on wholesale lots to 19.65¢. Jobbing prices for small lots of Straits Pig are still quoted at 21¢ @ 21½¢ ℔ lb, but the majority of sales have probably been made of late at the lower figure.

Copper.—Recent large sales of Lake Ingot will, it is estimated, involve 25,000,000 lb. Business is, however, again on a very moderate scale, and values are more or less irregular. Nevertheless prices for retail quantities generally maintain the former level of 10½¢ ℔ lb for Lake Ingot.

Sheet Copper.—Although the volume of inquiries for Manufactured Copper has been appreciably larger during the week, but few of them have as yet crystallized into definite business. Purchasing by consumers still continues to be of a very commonplace character and decidedly below the average for this season. Users of Sheet Copper are, like others similarly placed, buying from hand to mouth as the necessities of their daily business dictate. Individual orders placed with manufacturers and dealers are accordingly for

unusually limited amounts. Stocks in consumers' hands are insignificant, and conditions are favorable for a remarkably active demand for the material later on as general business conditions improve. Prices for small quantities of Sheet Copper remain on a basis of 15¢ ℔ lb, with no discount.

Pig Lead.—Buying has not been free or general, but enough business has passed to give the market quite a steady tone. Small lots of American Pig from store fetch in the neighborhood of 3⅞¢ ℔ lb, although a shading of ⅛¢ from that figure has been conceded to small buyers.

Lead Pipe and Sheet.—A fair volume of business is reported by plumbers' supply houses, but the demand for Manufactured Lead still keeps below the normal for this time of the year. List prices are firmly maintained.

Spelter.—The price of Ore has advanced lately, and the market for Spelter has stiffened. Consumption does not, however, show much increase, and jobbers' prices for small quantities remain at the former quotation of 4¼¢. ℔ lb for Western.

Sheet Zinc.—The market is strong at 5½¢ ℔ lb for 600 lb Casks, and 6¢ for single Sheets. Consumption does not expand to any large extent, nevertheless stocks are sufficiently narrow to insure steadiness at the advanced prices, even if a further rise does not take place. In another column will be found the revised Sheet Zinc discount sheet and list of extras issued by the manufacturers.

Antimony.—Except in a jobbing way the movement is very slow, but supplies are well taken up and prices for small quantities remain quite steady at 10¾¢ for Cookson's, and 10¢ for Hallett's.

Tin Plates.—The market for Tin Plates has not improved materially. While orders for future delivery show a slight increase, the movement is still slow for the season. Can makers appear to be postponing to the last moment the filling of their requirements, on the chance of obtaining their material under the lower duty rate. Canners' prospects for this season are referred to as very good so faras agricultural products are concerned, and Tin Plate dealers are in expectation of some good business in this quarter in the near future. Spot business is confined generally to the usual hand to mouth style of orders, but enough of these are passing to keep the trade fairly busy. That consumption throughout the country has increased during the past few weeks is sufficiently proved from the fact that shipments of Tin Plates from the other side in the month of May increased some 60 % over those for April, while it is stated that the amount of stocks in bond in this country showed little or no growth at the same time. Moreover, domestic manufacturers are busy and disposing of their product regularly. Prices are still low and somewhat weak, except for special sizes of which the stocks in bond are limited.

A special cable dispatch from London to *The Iron Age*, dated June 13, reports on the British Tin Plate market as follows: In the Tin Plate market there has been an improved business at somewhat better rates, chiefly three months' futures at full rates. Makers hesitate to book orders for far forward delivery in the face of stiff bids made by buyers for distant future shipments. Bessemer Cokes have advanced about 1½ pence during the week, and larger demand has raised the price of Ternes to 19/ for double box. Black Plate for prompt delivery is at a premium. Stocks at Swansea are 288,000 boxes.

Sheet Iron.—Galvanized Sheets for immediate delivery are scarce and prices are firmer. The same may be said of Black Sheets, especially those of lighter gauges suitable for tinning. The scarcity of fuel having caused the closing down of a number of mills, those which continue in operation are crowded with orders and are unable to quote prices for early delivery. The consumptive demand for ordinary Black Sheets in this district is not excessive, but those adapted for tinning are in very active demand and command good prices. Makers are not yet able to meet the increased demand for this material, but Tin mills are being widely added to existing works, and the productive capacity will within a short time be very largely increased.

Chicago Report.

Scrap.—Dealers continue to quote the following list of buying prices, Chicago delivery:

	Per net ton.	Per lb
No. 1 Wrought Scrap	$7.00	....
Machinery Cast	6.00	....
Malleable Cast	5.00	....
Stove Plate (free of burnt)	4.00	....
Burnt Iron and Grate Bars	3.00	....
Sheet Iron and Hoops	2.00	....
Plow Steel and Breaking Stock	4.00	....
No. 2, such as Shovels, Hoes, &c	3.00	....
Old Boilers—whole (Iron)	3.00	....
" (Iron)—cut in single Sheets and Rings	5.00	....
Old Gas-Pipe and Boiler Tubes	5.00	....
Cast Borings	3.00	....
Turnings	4.00	....
Horseshoes	8.00	....
Copper Bottoms	....	5½¢
Copper Clips and Heavy	....	7 ¢
Heavy Brass	....	5½¢
Light Brass	....	3 ¢
Pipe Lead	....	2¼¢
Tea Lead	....	2 ¢
Zinc	....	2 ¢
Rubber	....	3½¢

Anthracite.—Trade keeps up well, notwithstanding the advance. The scarcity of Soft Coal is severely felt, diverting many consumers to the use of anthracite. Carload lots of 12 net tons or over are quoted as follows:

	Grate.	Egg, Sto. and Ch
Chicago, Ill	$5.25	$5 50
Milwaukee, Wis	5.25	5.50
Kansas City, Mo	8.45	8.70
Council Bluffs, Iowa	8.45	8.70
Lincoln, Neb	8.60	8.85
Sioux City, Iowa	8.45	8.70
Aberdeen, S. Dak	8.50	8.75

Cheyenne, Wyo	10.00
All points between Denver and Missouri River	8.85

The American built steamer "El Rio" made the trip from New York to New Orleans last week in 4 days, 17 hours and 28 minutes, breaking all previous records by over two hours.

CONDITION OF THE

Hardware Trade.

THE USUAL FALLING OFF in the volume of business which is noticeable in the middle of June is this year increased somewhat by the prevailing quietness in trade, and as a result merchants and manufacturers refer to business as dull. A good many travelers are home, but there is still a good force on the road. Orders for the most part are carefully assorted and considerably smaller than usual, the trade being careful to restrict their purchases to their actual requirements. There is little new in the matter of prices, and on the general line of Shelf Hardware the market is low and somewhat uneven. Manufacturers, especially in heavy goods, are carefully booking orders for future delivery, realizing that there may a change in existing conditions. The trade are looking forward to a quiet business during the next month or two, but hoping that if tariff questions are settled and financial matters are not disturbed there will be a good trade in the fall.

The following letter from Farwell, Ozmun, Kirk & Co., St. Paul, was intended for use in our last issue, but was received after we had gone to press:

Business is showing the usual impulse of the season to some extent and our jobbers have an increased number of orders, but there is not sufficient increase to bring the volume of trade up to that of May, 1893, and this is true notwithstanding the fact that during May of last year the effects of the panic had begun generally to affect business. The trade is also running along more uniformly than was true earlier in the season, and it is now free from any spasmodic features.

The difference is now but little in the sales of corresponding months of the two years, and by July it is reasonably to be expected that the balance on sales per month will be considerably in favor of the present year. This will certainly be true if the crops come on anywhere nearly as favorable as they now promise.

On the whole the jobbing interests of the Northwest are doing fully as well as expected in amount of trade, and this is to be measured with the fact in view that credits are now more carefully scrutinized than ever before. With anything like fair crops jobbers expect very light losses through bad debts.

Prices have advanced on Nails, and the market is firm at present. As to what will be the more lasting effect of the coal strike on the price of Nails and other staples, it is a matter of speculation, but it is certain that for some time to come the price will be affected to some extent. Prices on Barbed Wire and Tin Plate are firm.

The market here is following the advance on Rope. Collections are up to expectations and are fair for the season.

Advices from Chicago.—The movement in Shelf Hardware continues about the same as reported last week. The present week has opened up fairly well with a good number of orders coming in from traveling salesmen and also in ordinary mail. The month is expected to show up about the same as May, notwithstanding the increased sales during a part of that month on account of the freight flurry. No special change has occurred in prices of either Shelf or staple goods. The Heavy Hardware trade is fair and moves along steadily from week to week at about the same volume. Jobbers are now receiving the benefit of the

failure to make future contracts last spring by the Wagon and Carriage manufacturers. They are coming into the market regularly for their purchases of material, thus contributing their share of swelling the current volume of business. Collections are good and payments are being more promptly made than usual within the regular times fixed for credits.

Notes on Prices.

Wire Nails.—The Wire Nail market continues firm, with a fair though not heavy amount of business. Quotations are well maintained on the basis of $1.10 to $1.15 for carload lots, f.o.b. mill. Small lots from store in New York are held at $1.25 to $1 30.

Advices from Chicago.—Manufacturers are receiving some inquiries, but they are by no means numerous or large. A quiet appears to have set in, which may continue for some time. More factories have shut down for lack of fuel, and a general closing is expected to take place in July as usual. Prices are very firm, on account of the diminished production and increased cost of raw material, as well as advances in freight rates. Quotations now range from $1.20 to $1.25, Chicago, for factory lots. Jobbers quote $1.25 for small lots from stock, and report a fair trade, but no call for carload lots.

Cut Nails.—There has been comparatively little change in the Cut Nail market for several weeks, this line not advancing in sympathy with Wire Nails as much as the manufacturers would desire. There is active competition among the mills for such business as is going, and some Western companies are looking aggressively after business in the East, which has the effect of keeping prices lower than they would otherwise be in the territory of the Eastern mills. The demand is fair and the aggregate of orders considerable, although the trade are not buying very freely nor in excess of their actual wants. Sales have been made of Western Nails during the past fortnight at figures which, taking into consideration the present cost of production, are lower than have previously been made. Eastern mills are quoting 95 cents to $1 for Nails delivered on dock in New York. The store price for small lots in New York is $1.10 to $1.15.

Advices from Chicago.—The market looks a little firmer. Sales are being made for immediate shipment and manufacturers are not attempting to make contracts for future delivery. Concessions are now refused, and extreme rates current a short time since have been completely withdrawn. Prices quoted by Wheeling manufacturers are higher, but local rates continue at 90 to 95 cents on 55-cent average, with a very fair volume of business reported for the week. Jobbers are having only a light trade in Cut Nails, but continue quotations for small lots from stock at $1.10 to $1.15.

Barb Wire.—The Barb Wire market is quiet and without new features of importance. The following quotations for Four-Point Galvanized Wire, delivered at the points named, represent the market: Pittsburgh, $2.10 to $2.15; Cleveland, $2.15 to $2.20; Cincinnati or Allentown, $2.20 to $2 25; Chicago or New York, $2.25 to $2.30.

Advices from Chicago.—Manufacturers of standard Wire have advanced their quotations 5 cents per hundred on account of advancing freight rates and higher cost of raw material. The local makers are still behind in their shipments, but new business shows a marked falling off and is expected to be quiet for some time. Mills generally will be closed for repairs during July. Prices are therefore expected to be maintained at rates now fixed. Plain Wire shows a steadily advancing tendency. Jobbers are having a light trade from stock. Quotations are continued on Galvanized Barb Wire at $2.35 to $2.40 for small lots and $2.20 to $2.25 for carload lots.

Cordage.—The demand is very fair and business is quite active considering the season. The recent advance of ¼ cent per pound in Manila, Sisal and New Zealand has been maintained and the market is characterized by a strong tone. Quotations for large lots, f.o.b. factory or New York, are as follows, subject only to a discount of 1½ per cent. for cash.

	Cents.
Manila, base	7
Sisal, "	5
New Zealand, base	5

Sheet Zinc.—Matthiessen & Hegeler Zinc Company, La Salle, Ill., issue a revised discount sheet under date of May 28. The base price, $4.50 per 100 pounds, continues unchanged, but revised discounts are announced as follows:

Discounts.	First class. 15 600-pound casks and upward.	Second class. 10 to 14 600-pound casks.	Third class. 5 to 9 600-pound casks.	Fourth class. Under 5 600-pound casks.
	Per cent.	Per cent.	Per cent.	Per cent.

24 x 84	140	100	80	20	15	05	05	05	05	05	05

The extra on No. 4 36 x 84 is $1.25 per 100 pounds.

Double Tank Thermometer Churn.—R. M. Ball, Muncie, Ind., is manufacturing this article, which was described in *The Metal Worker* June 9. The Churn is sold to the trade at $42 per dozen, net, f.o.b. Muncie.

Scrapers.—The Scraper which is being introduced by Harris E. Thomas, Lansing, Mich., an illustration of which was given in our last issue, is sold at $2 per dozen, or $20 per gross, net.

Telephones.—The Telephone outfit described in *The Metal Worker* June 7, and manufactured by Robert H. Ingersoll & Brother, 65 Cortlandt street, New York, is sold at $7.50, subject to a discount of 33⅓ per cent.

Glass.—Local Glass trade is reported as being light, while from Glass centers we learn that Glass is in fair demand. Prices continue firm, and manufacturers as a rule are not making concessions to induce trade. Factory quotations in car lots are reported from Pittsburgh as follows: Single strength, 80 and 10 and 5 per cent. discount; double strength Glass, 80 and 20 per cent. discount. French window Glass is reported firm at 80 and 10 per cent. discount for single or double strength, in any quantities. Plate Glass is in fair demand, the imported article being quoted at 70 and 10 per cent. discount.

Old Metals.—The demand for Old Metals moves slowly and prices continue on their former low level. The following quotations represent about the prices paid by New York dealers:

Heavy Copper	℔ lb	6¾¢
Light and Tinned Copper	℔ lb	6 ¢
Heavy Brass	℔ lb	4½¢
Light Brass	℔ lb	3¾¢
Lead	℔ lb	2½¢

Old Rubber.—The following are about the prices for Old Rubber, delivered in New York, except where otherwise stated:

Car Springs, ton lots, ℔ lb.	@	$0.03½
Rubber Shoes, carloads, delivered at factory, ℔ lb.	@	.03½
Rubber shoes, less than carloads, ℔ lb.	@	.03¼
Large Hose, ℔ ton	@	12.00
White Wringer Rolls, ℔ lb.	@	.03¾
White Syringes, ℔ lb	@	.03¾

Trade Notes.

WE ARE INDEBTED to William J. H. Gluck, Baltimore, Md., for a batch of interesting advertising matter relating to the very extensive line of goods that he handles. Two of the larger catalogues relate to leading Stoves, both coal and gasoline; the separate slips call attention to Refrigerators, Ovens, Gauze Door Ranges, Oil Stoves, Sieves and Strainers, Steam Cookers, &c. The separate pamphlets are illustrated catalogues and price-lists of Refrigerators of different sorts and Ice Cream Freezers. The prettiest of the circulars relates to Iron Clad Ware handled by Mr. Gluck.

THE ROME MFG. COMPANY, Rome, N. Y., manufacturers of Rome Seamless Copper Tea Kettles, Tea and Coffee Pots, have opened an office at 92 Walker street, New York City, where they will be represented by A. A. Butler, who will carry a full line of their goods to supply the New York City and Eastern trade.

THIS WEEK'S ADVERTISEMENT of the Excelsior Steel Furnace Company, 38 West Monroe street, Chicago, gives a complete price-list of Register Boxes for first and second floors, outside and inside. The company manufacture and keep in stock all kinds and sizes of such Boxes.

THE TRADE will regret to receive the announcement sent out by the Townley Metal Company, Kansas City, Mo., under date of June 6, of the death of W. F. Beckwith, which occurred on June 5 at Pittsburgh, Kan. Mr. Beckwith was on one of his regular business trips when he was taken ill with malarial fever, which, in spite of every care and attention, terminated fatally.

UNDER DATE of May 15 the Rome Mfg. Company, Rome, N. Y., issue a revised price-list of nickel plated and polished copper Tea Kettles, nickel plated and polished copper Range Kettles, nickel plated copper Tea and Coffee Pots.

THE PLANT of the W. F. Washburn Brass & Iron Works, Yonkers, N. Y., was sold under the direction of the receiver, Joseph M. Stoughton, at public auction, June 6, by E. De Forest Shelton & Co., 280 Broadway, New York City. The machinery was sold in many lots, to buyers from Pennsylvania to New Hampshire, thus removing the possibility of the plant being again started at Yonkers.

MERCHANT & COMPANY, INCORPORATED, Philadelphia, send out a pretty pamphlet printed in colors, relating to Merchant's Metal Tiles, Star Ventilator and Continuous Roofing Tin. The title of the little circular is "Metal Specialties for 1894."

C. MACKINTOSH, 61 Beekman street, New York, has been appointed sales agent in New York, Pennsylvania east of Harrisburg and the Northeastern States for the New Philadelphia Iron & Steel Company of New Philadelphia, Ohio, makers of Black and Galvanized Sheet Iron and Sheet Steel.

Apparatus for Electric Welding.

Letters patent for an apparatus for electric welding embodying several new and novel features have been issued to Rudolph M. Hunter, and been assigned to the Johnson Company of Johnstown, Pa. The particular construction employed as an example of the use of the apparatus is that in which it is used for the manufacture of steel rails wherein the feet or chairs are welded to the webs of the girder rail so as to give it additional hight and a self supporting base. This rail construction is well known and has been manufactured by other methods of welding the two parts together. In the processes heretofore used for electrically welding the feet to the web of a girder rail, there was employed apparatus in which the two parts were firmly gripped in suitable jaws, the parts pressed together, and an alternating current of great volume caused to pass through the parts in contact so as to cause the metal to fuse and weld together.

In carrying out the present invention the two parts of the metal to be welded are brought in firm contact and submerged in a liquid, preferably acidulated water. While so immersed a continuous electric current from an electrode in contact with the liquid is passed through the metal parts to be united and back to the source of electrical energy, the liquid being employed as a conductor for the current. In practice the positive current is delivered to the electrode submerged in the liquid and the negative current is delivered to the parts of the metal to be welded. The action of the current causes the decomposition of the liquid, generating gases adjacent to the metal parts in contact to be welded, and this produces such reactions that the portions of the metal in contact with the liquid are instantly brought to a welding heat. In this method of welding a considerably more intense current or one of greater tension is required than in the alternating system before referred to, and the current is preferably continuous in its nature or what is known as a continuous current as distinguished from an alternating current. It might be a pulsating or intermittent current if desired. When the two parts of the metal in contact are fused or brought to a welding heat they instantly unite, forming an integral structure; and this joint may be further strengthened by having the parts which are welded subjected to pressure performed by hydraulic, gravity or steam devices.

In this particular device a traveling support or carriage is provided for the girder rail and suitable clamps carried by the carriage for the feet, whereby the latter may be adjusted in position with respect to the rail while it is held on the carriage. At one place adjacent to the rails or bed upon which the carriage moves the joint between the foot portions and the girder rail is surrounded by a suitable hollow frame through which a liquid is caused to flow to submerge the parts in contact during the electric welding operation. After the welding has been performed the liquid is lowered, the hollow frame is separated, and the rail with its welded foot is moved along to be brought under a hammer or compression device. Simultaneously with the foregoing operation a second foot, previously clamped in position upon the rail, is brought into position so as to be held in the hollow frame and subjected in its turn to the welding operation. By this means the welding and forging or compression operations may be carried on simultaneously but successively with respect to a single part operated on.

News and Notes.

The receivers of the Union Pacific Railroad have concluded to relieve the company of the burden of carrying numerous small branch lines which have no prospect of paying operating expenses. An application has been made to the court asking permission to drop a number of branch roads aggregating about 1100 miles.

The offer of a prize of $50,000 for the invention of the best underground electric propulsion system, to be determined by the State Railroad Commissioners, has been withdrawn by the Metropolitan Traction Company of New York City.

A striking illustration of the value of goods depending on their proximity to market is shown by the railroads in Mexico using mahogany for ties, this valuable wood being there so abundant and difficult of carriage to markets where it is called for.

The waters of the disastrous flood in the Frazer River Valley, B. C., are subsiding, leaving behind them ruined crops, devastated farms, drowned cattle, and even loss of human life. The amount of damage done by the flood is estimated at several million dollars.

A joint conference between the leaders of the Knights of Labor, American Federation of Labor and other labor organizations began in St. Louis on Monday. Its object is to arrive, if possible, at an agreement for harmonious and concerted action in the questions now under agitation.

Three Chinese naval officers attached to the Chinese Legation at Washington are visiting the shipbuilding establishments of the United States, with a view of studying methods of construction for the benefit of their country. They have been making a close inspection of the Philadelphia yards this week.

The Cramps have been ordered to proceed with the work of repairing the damage done to the hull of the cruiser "Columbia" at her recent trial. The work will be done at the League Island Navy Yard, Philadelphia, and will occupy about a month.

The rolling mill operatives at the northern end of the Tuscarawas Valley, Ohio, have not displayed that careful exercise of judgment during the coal miners' strike that has characterized their actions in the past when disturbances of this kind occurred. While trouble may be fast approaching for themselves they enter freely into those of others. At Canal Dover, Ohio, the rolling mill men of that place and New Philadelphia were ringleaders in an attempt to prevent the militia from going to Cambridge, and on Saturday last formed a parade and marched to Pike Run, south of New Philadelphia, to take part in a mass meeting of miners. The members of the Amalgamated lodges walked 6 miles and back under a scorching sun, but the miners concluded to stay at home and did not avail themselves of the kindly offices of the iron workers, whose action caused much surprise and adverse comment.

Self Reliance.

No man was ever truly great who was not self reliant. The very exercise of this virtue sets the man apart from his fellows in the walks of life, makes of him a thinking being who decides for himself and acts for himself. His deeds bespeak his inner thoughts; they do not merely reflect the ideas of others. No matter how far down in the scale we go, still we find the man who relies first upon himself, creates for himself a distinct individuality, is the man who gradually climbs above his fellows and his surroundings. Daily and hourly the mechanic is called upon to display that ability of his order that should enable him to do his work rapidly and well without the help of others. Not that such an individual should become egotistical, but that he should so consider and apply that which he has read and heard that at the moment of application he need not run to others for suggestions. It is a matter of thinking and deciding for himself, and each time he does it his future ability is increased, his self reliance strengthened. Every foreman or superintendent soon reads the character of his men. Some in the spirit of sincere interest will ask deep and searching questions as to why and wherefore; others are soon marked by their habit of continued questioning apparently because it is easier to ask than to think. To this latter class there will, as a consequence, be given little of the work requiring forethought and judgment; in fact, the very opportunity of exercising such self reliance as they may possess will be removed, while the men to whom such tasks are given will be continually educated and elevated.

Cultivating Self Reliance.

While heredity may have somewhat to do with a man's abilityto think and act for himself, nevertheless no man can be excused, for it is a virtue that can be trained. The good work must begin at home; the man must first learn to control himself before he can expect to exercise his ability over or among others. It is related of "Stonewall" Jackson that his wonderful success was due to his continued exercise of self control and self denial, and that thus "he had conquered himself and was thus made fit to be a conqueror." So the mechanic who first determines to conquer himself, who resolves never to ask a question until he has first endeavored to answer it himself, who willingly hears the opinions of others, but carefully forms his own, will gradually but certainly change his character and make his actions more and more independent of those of others. The self reliant mechanic can never be merely imitative; he must, in the broad sense, be creative, inventive. Even if he has a thousand times seen a thing done in a certain way it is no reason why he should not seek a better if that already known is not satisfactory. To almost every mechanic comes constantly the necessity of determining some way of accomplishing a result which he has never seen before. It is so easy to fall into an abstract way of thinking of such matters, feeling that like a sermon they apply to some one else, that the ordinary man fails to profit by their consideration. Let him rather test the advice in his next day's work. Let him determine that what he does shall be done by right of his ability to accomplish it; that he will command confidence by his self reliance; that he will seek rather than avoid opportunities to assume responsibility. The change will not come in a day, but come it will, and as the months and years roll by he will find himself, and, better still, others will discover him, to be a thinking, a self denying, a self controlling, a self reliant man.

Features of the Coal Strike.

The coal miners' strike is ending in about the usual way. Some districts have been able to secure the advance for which they contended, others got no advance and some figure out an actual reduction. The national leaders have lost their prestige and in those districts in which no substantial advantage has been gained it would hardly be safe for them to put in an appearance. For nearly two months the miners and their families have endured pitiful privations and now find themselves too often burdened with an indebtedness which will require months of the most pinching economy to discharge. Meanwhile their reflections must be bitter against the foolish leaders who ordered the unions under their control to strike. But particularly bitter must the reflections be of those miners who had no personal grievances and merely struck through sympathy, in the belief that a general suspension of coal mining would end the strike very quickly. They were greatly deceived in their estimate of the stocks of coal above ground and the supply available from mines not yet under control of the unions. Coal consumers themselves have doubtless been surprised to find that so long a strike could be experienced without much more serious results occurring from the scarcity of fuel.

Lesson of the Strike.

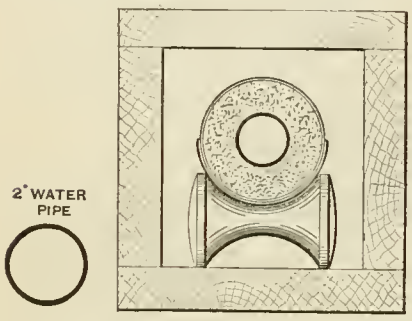
A lesson of this strike, therefore, and one which should be taken to heart at this time by other workingmen in danger of being beguiled by seductive agitators, is the very long time needed to make the strike felt by any considerable proportion of the public. A stoppage of the mines for a week or two was expected to check all business and create a formidable sentiment in favor of the quickest means to settle the strike. Such a short suspension of work was a holiday, and the miners threw down their picks with alarcity. Had they known that nearly two months would be permitted to pass without a general wail of distress from consumers, it may be doubted whether they would so cheerfully have courted the uncertainties of a strike. No matter how necessary their product may be, the workingmen in any line will find a period of business depression a poor time for entering upon a strike with any expectation of gaining substantial benefit.

The City Council of Philadelphia have just passed an excellent ordinance in relation to the removal of kitchen and other garbage. It directs that housekeepers shall use only metal receptacles, water tight and covered, for the garbage, which will be removed by the contractors in metal, water tight and covered carts. Heretofore the practice of householders there, as in New York and Brooklyn, was to place all kinds of open vessels and receptacles full of garbage on the sidewalks to await removal, regardless of their being offensive to sight and smell, and that the wind frequently blew the lighter kind of refuse into the neighboring properties, conveying, perhaps, some disease with it. The order provides that householders or contractors failing to observe the new regulations will be subject to arrest and a fine. This sensible proceeding might be followed with advantage by the municipal authorities in other cities where the unsanitary practice of leaving uncovered refuse pails on the sidewalks for hours still prevails.

THE LETTER BOX.

Long Line Piping for Steam Pump.

From FOUNDRYMAN, *Tennessee.*—We wish to run a steam pipe from our boiler to a pump located near a creek, to force water into a tank on top of a tower 50 feet high. The boiler is 700 feet from the pump and the steam pipe is to be run under ground. The pump is located on the side of a hill. It is 50 feet from the top of hill to creek and the pump is 20 feet from top of hill, but is sunk into a pit, leaving it about 15 feet above water level. From boiler to top of hill (680 feet) the steam pipe will run on about a level. The boiler is 40 horse-power and is run at 60 to 80 pounds pressure. The pump is a Deane pressure pump. The diameter of steam cylinder is 7 inches; dismeter of water cylinder, 4¼ inches; stroke, 8 inches, and capacity 120 strokes per minute or 58 gallons per minute. Size of steam pipe, 1 inch; size of steam exhaust pipe, 1½ inches; size of suction, 3 inches; size of discharge, 2 inches. What we wish to know is whether a steam pipe can be run from the boiler to the pump so that it will work successfully; what size steam pipe it will require; how should steam pipe be protected under ground from freezing, &c.; how should the pipe be drained, and what provision should be made for expansion and contraction?



Long Line Piping for Steam Pump.—Fig. 1.—Section through Box and Steam and Water Pipes.

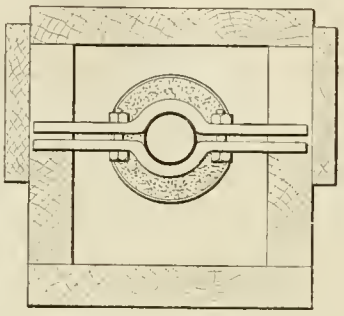


Fig. 2.—Section Showing Clamp.

Answer.—The question of size of pipe for the duty and friction of pumping for water and the friction and condensation of steam require some consideration. With a 2-inch discharge pipe carrying 50 gallons per minute, the friction head for 700 feet of pipe with the necessary elbows will be 20 pounds per square inch or 46 feet in addition to the total hight from the creek to the tank, which, as we interpret the meaning of our correspondent, may make a total of 146 feet head to be pumped against. This is equal to 63 pounds per square inch pressure on the pump piston. As the steam cylinder is two and three-quarter times the area of the water cylinder, then $\frac{63}{2.75} = 23$ pounds, the actual steam pressure required upon the steam piston per square inch to balance the pump pressure. To this should be added 50 per cent. for pump friction under the required speed, say 35 pounds pressure at the pump.

The steam cylinder at 100 strokes per minute will require 18 cubic feet of steam per minute at 35 pounds pressure, or 10½ cubic feet at 60 pounds pressure, the lowest normal pressure at the boiler. This would involve a loss of 35 pounds pressure by friction and condensation if 1-inch pipe is used, so that the next size larger, or 1¼ inch, is the smallest that should be used, which will involve a friction loss of 21 pounds, making the pressure at the pump 39 pounds or sufficient for its work.

The expansion of the steam pipe should be provided for for a length of 650 feet, say from the point of entering the ground to the brow of the hill. For this purpose a hard brass slip joint made for a run of 14 inches should be inserted as near the middle of the line as convenient in a bricked up chamber with cover large enough for convenience in packing the joint. A strong clamp and anchorage at each end of the straight pipe line will divide the expansion so that the travel at the expansion joint will be as short as possible on either line, and which is found to be more satisfactory than to have the expansion move all in one way, in which case the slip joint could be placed in the boiler room. For the protection of the pipe not less than 1-inch felting of hair, or, better, magnesia felting, should be put on the pipe throughout its whole length from boiler to pump. At places from 12 to 15 feet apart a piece of galvanized sheet iron should be wired on the under side of the felting long enough to ride on a light cast iron spool, with the neck curved to fit the outside of the felting and sheet iron so that the spool will keep in its proper traversing position.

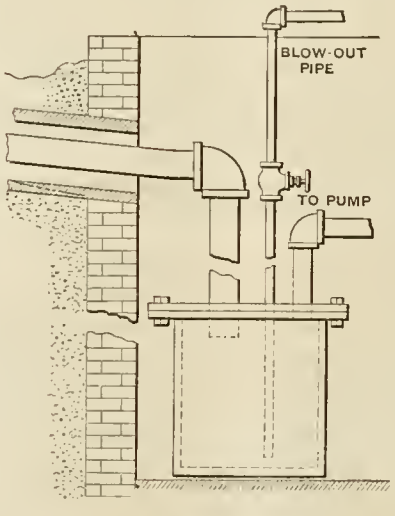

Fig. 3.—Separator Connection.

Outside of all should be made a box of pine, or, better, oak, wide and high enough to clear the felting by 1 inch all around, as shown in the cut, Fig. 1. The clamps, Fig. 2, should be made of ⅝ x 2 inch iron, 8½ inches long, let into the box between two sections, and a strip nailed over the slot to close the opening. One foot earth covering is sufficient for the climate where our correspondent is located. The steam pipe at the pump pit should drop into a cast iron separator of about 1 cubic foot capacity, which may be made of any convenient pattern, as a pot, with bolted cover, strong enough for the highest steam pressure in the boiler; with the pipe connections as illustrated in Fig. 3, or a piece of 6 or 8 inch pipe, 2 to 3 feet long, with caps, set on end and connected with the steam pump and waste pipe, carrying out the principles illustrated in Fig. 3, may be used. An ordinary float steam trap, such as used in the steam heating trade, which is automatic in operation, may also be used for a separator, the pump pipe being tapped through the cover away from the inlet. One-inch pipe and valve is large enough for the pump steam connection. After a few trials our correspondent will learn how often to blow off the waste trap if the plain box is used. The water pipe need be laid no deeper than the bottom of the box and in the same trench, as in Fig. 1. The warmth of the box will protect it from freezing. An air chamber on both suction and force pipe is required, possibly furnished with the pump. A large fine meshed strainer and foot valve at the lower end of the suction pipe, well

protected from flood and ice, with good judgment in making all the pipe work tight and the examination of every piece of pipe for obstruction previous to putting in place, will, we think, make our correspondent's pumping plant a success from the start.

Wants a Better System.

From T. H H., *Harrisburg, Pa.*—I notice in *The Metal Worker* of May 12 the letter of "W. S. G." of Penbrook, Pa., condemning the system of heating and ventilating a church in course of erection there. Now I would like to say for his benefit and those who have been commenting upon the matter that his statements are not in any sense facts. The statements were made partly through ignorance of the intent of the plans and, I think, partly intentional. His diagram showing the location of the registers is only in part correct. He then goes on to say that I intend to drive the stagnant air out of the room through the stack, which is as cold as Greenland. He, of course, did not know that this was to be warmed by the smoke flue, which will undoubtedly cause upward currents. The next misstatement he makes is that I intend to get my fresh air from the cellar. If he had taken the pains to have read the carpenter's specifications he would find that the carpenter has been directed to put in cold air ducts at the proper time, as may be directed. He then says that if the furnace were put in according to the plan the result would be a warm ceiling and a cold floor, also great loss of heat through friction and radiation in the cellar. I have recommended that the pipes be wrapped with asbestos paper, thereby reducing the loss from radiation to a trifle. The next barrier to perfection in the system, he claims, is that the chimney is lower than the roof. Now the top of the chimney is 20 inches lower than the comb of the roof and stands 18 feet away, with no other obstruction near. Now if "W. S. G." will insist that a stack as high as that one, and located as it is, will have down currents he only displays his ignorance. I have had some experience with his plan of pouring hot air into a room in an undivided volume, and I have found that those sitting near that volume roasted, while those around the outside of the room froze. Therefore I claim that distributing the heating registers is superior to bringing in the hot air in one volume and forcing it to all parts of the room. Especially is this true when there are heavy air currents on the outside. "W. S. G." should learn all the facts in a case before coming before the public and roasting any one, as one of the correspondents puts it, who through ignorance recommends anything that will be detrimental to health and comfort.

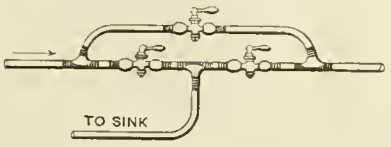
Wants Statistics on Brick Set Furnaces.

From CÆSAR, *Louisville.*—I noticed a short time ago, cannot say just where, a statement that brick set furnaces were passing out of date. Can *The Metal Worker* or its readers give about the difference in number that were put up ten years ago and in what proportion they are being placed at present? I would like to hear from some good brother of the craft why this decline, and why the portable is favored. There are several good reasons for it that can be proven to any practical furnaceman. This is a very important matter to the craft generally and a general discussion of it will prove beneficial.

What Is a By-Pass?

From E. O. H., *Melrose, Mass.*—I saw in *The Metal Worker*, May 5, the letter of "A. J. C.," asking "What is a by-pass?" The answer seems plain enough, but I cannot think of any possible circumstance where such an arrangement would be necessary, consequently I thought I did not understand the answer. I send two sketches of bypassaes, Fig. 1 showing the by-pass described in the answer, and I would ask why is Fig. 2 not a by-pass?

Answer.—A by-pasa is virtually another way to a given point, and it is possible that our description of its use has misled our correspondent. If a water meter or water motor was placed on the pipe at the point where the branch is taken off in Fig. 1, by opening the cock in the by-pass, water could pass beyond it and supply the main when



What is a By-Pass?—Fig. 1.—Showing a By-Pass.

the meter or motor was disconnected for any cause and the other cocks closed. In the use of valves on large street mains with a heavy pressure a bypass is frequently used in order to open them by letting water in the main beyond the valve to equalize the pressure on both sides of the valve gate. Otherwise a pressure of 60 pounds to the square inch on a 48-inch valve would find the gate withstanding a pressure of over 100,000 pounds and without the aid of a by pass to equalize the pressure the opening of the valve would be a difficult matter. From this description

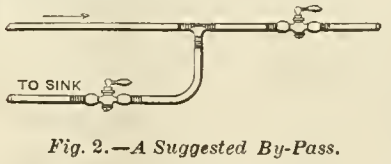


Fig. 2.—A Suggested By-Pass.

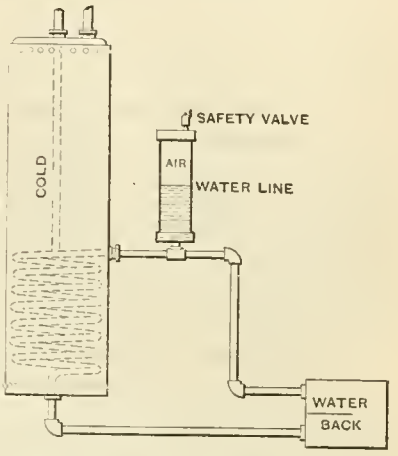
of the use of a by-pass our correspondent can readily see why Fig. 2 is not adapted to serve as one. Another character of by-pass is shown and described in the letter of "Oliver Twist," in *The Metal Worker*, June 9.

Choked Water Backs.

From P., *Paterson, N. J.*—Having noticed the letters of "E. J. Y." and "Swiped Joint" in the Letter Box, May 19 and June 2, I can say that the latter's suggestion of running a pipe through the boiler is feasible. There should be 1 square foot of surface exposed in the pipe for every 5 gallons of water in the boiler to insure the water being heated. A pipe running down through the boiler would not be enough. Boilers for heating the water by steam are made with coils of proper proportion in them. With such a boiler it would only be necessary to use a closed expansion tank attached to the pipe from the water back. This tank is simply an air chamber and should not be entirely filled, and should have a safety valve at the top, as shown by the



Choked Water Backs.

sketch. If it was made of 3-inch pipe, 18 inches long, and connected to the piping it would be ample. The pressure under which the circulation would take place would depend upon how much the air was compressed by the expansion of the water when it was heated. The water might be heated in the pressure system several degrees above the boiling point and would heat the water in the boiler faster in proportion to the increased temperature. If rain water or distilled water was used in the pressure system the water back or pipes would never become choked or reduced in capacity, and it is probable that there would not be sufficient deposit in the boiler or the cold supply or hot service to make trouble.

Miter Patterns.

From H. F. M., *Frankford, Pa.*—Will *The Metal Worker* kindly explain the method of obtaining the pattern for an ogee miter at other than right angles? I am aware that a miter line is employed, but do not understand its use, being only familiar with the short or usual method of obtaining the pattern for a square miter where the miter line is not used.

Answer.—As indicated by our correspondent, the pattern for a square return miter can be obtained from the profile, as shown in elevation. The pattern can also be obtained from the plan, a miter line being used in connection with the elevation. The latter method is usually employed for obtaining the patterns for a vase or urn having more than four sides, or for a return miter at other than right angles. If our correspondent desires a thorough understanding of the subject, he is referred to "The Metal Worker Pattern Book," pages 63 to 73, also to section 539 on page 153, and the accompanying figure on page 154.

Wants a Good Cement.

From R. P., *Huntsville, Texas.*—Will some of the readers of *The Metal Worker* please give a reliable recipe for fastening woolen cloth to tin or brass so that it will not peel off? I have a book on cements and glue, but find nothing satisfactory.

STOVE TRADE NOTES.

The Bryce Soft Coal Self Feeding Furnace.

The Bryce Furnace Company, 129 Huron street, Toledo, Ohio, have just published an illustrated catalogue of their furnaces and heaters. The catalogue, which is quite an artistic production, comprises 40 pages of very interesting reading matter on the subject of the Bryce self feeding furnace, which is specially designed for the use of soft coal. It is, however, equally adapted for hard coal or coke. Sectional cuts are printed to show the internal construction of this furnace and to explain the method of its operation. While the use of soft coal which cakes is to be avoided, the statement is made that all the other kinds of soft coal can be burned with good results, without the formation of smoke or soot, and with no more attention than is usually given to the operation of a hard coal base burner.

The magazine is of course immediately over the fire pot. The feed door is in the front of the furnace, high enough to deliver coal into the top of the magazine through a short chute. The magazine has a double shell to admit of the passage of gases and smoke from the top of the coal over the top of the interior shell down to the fire pot. After the fire is well started the draft is taken in at the magazine feed door, which then causes a down draft, consuming the gases and preventing the formation of smoke. Several styles of this furnace are shown. It is not only made for warm air but also for combination heating by warm air and hot water. The combination furnace has a water ring round the lower portion of the magazine immediately over the hottest part of the fire pot. These furnaces are furnished either in portable form or brick set.

The testimonials collected from users of the Bryce furnace scattered over a very large part of the West form a remarkably strong support of the claims made by the manufacturers that their furnace burns soft coal with economy and with very satisfactory results in heating. Agencies have been established at Columbus, Ohio; Buffalo, N. Y.; Minneapolis, Minn.; Goshen, Ind., and Iowa City, Iowa.

The Favorite Stove & Range Company

of Piqua, Ohio, and with branch at St. Paul, Minn., have issued a very handsome catalogue illustrating and describing the Favorite stoves and ranges, Favorite gas ranges and Favorite Piqua hollow ware. The binding is in embossed covers and the printing in black upon a fine quality of heavy calendered paper. Among the opening pages is a bird's eye view of the company's works and a steel engraving of W. K. Boal, president and founder of the company. The pages of the catalogue are of rather larger size than the majority of stove trade publications at the present time, and afford opportunity for the presentation of well executed engravings, accompanied by full descriptive particulars. The Favorite ranges occupy the first 40 pages, followed by the line of Birthday ranges, which are the same as the Favorite four-hole ranges, with the exception of the ornamentation. The Favorite cook stoves for 1894 for coal and wood comprise an interesting assortment of richly decorated constructions embodying the latest features. The line of Favorite gas ranges follows next, these goods being richly ornamented and offered in such variety as to meet all requirements. The heating stoves, led by the Favorite base burner, are treated in a comprehensive manner, and include the Carbon Favorite soft coal surface burner, Vesta Franklin, the West Point base burner, the Favorite base heater for wood, in which the application of the Todd stove principle is made to a cottage parlor; the Forest Favorite, Viola, Earl and Don. Several pages are given to the Favorite Piqua hollow ware and also to price-lists of stove trimmings, &c. An important announcement relative to the company's trade-mark as a means of advertising their entire line is printed in red on the last page. The catalogue considered as a whole is very attractive in its make up, and is a publication of which the company may justly be proud.

Consolidation of Vapor and Gas Stove Interests.

In the last issue we referred to the negotiations which have been in progress for some months past between Emerson McMillin & Co. of 40 Wall street, New York City, and certain of the vapor and gas stove concerns of the country, looking to the acquisition of these properties by the United Vapor & Gas Stove Company. Among the concerns interested is the Dangler Stove & Mfg. Company of Cleveland, Ohio, the president of which is David A. Dangler. In an interview the early part of the week with a representative of the Cleveland *Leader* Mr. Dangler is reported to have made the following statement respecting the movement in question :

"Under the circumstances I think it is time that the public should have a correct understanding of this consolidation of vapor and gas stove companies. It is true that the manufacturers in this line have perfected a combination of the following companies: The Quick Meal Vapor Stove Company of St. Louis, Johnson & Brandon of St. Louis, the George M. Clark Company of Chicago, the Baxter Stove Company of Mansfield, Ohio, and the Aurora Vapor Stove Company, the Schneider & Trenkamp Company, the Standard Lighting Company, and the Dangler Stove & Mfg. Company, all of Cleveland. We have already secured a certificate of incorporation under the laws of Illinois. We selected that State on account of its central location. The capital stock of the new company, which is called the United Vapor & Gas Stove Company, is $8,500,000. This amount is based upon the actual value of the franchises of the different companies, including real estate, other property, and some 150 fundamental patents which actually control the vapor interests of the world. The earnings of these companies last year would about pay 10 per cent. on the capital stock of $8,500,000."

"What is the object of this consolidation ?"

"First, increased advantages in combining the experience of all these manufacturers, in the purchase of material in greater quantities, and in the saving of royalties which the different manufacturers have paid to each other in the past. This last named saving alone amounts to fully $100,000 annually. Secondly, we shall so place the product as to sell direct to the retail dealer from the nearest point of shipment. In this way we can materially reduce the cost to the consumer by saving the profit of the jobber or middleman. In the third place, we shall save greatly in office and road expenses. The total saving, including rebates, to be made by the consolidation, we have estimated at $250,000 a year."

"When will your organization be completed ?"

"In the course of a week or ten days. The time fixed for the final transfer of all properties to the new company is August 1. It is expected that there will be one director from each company. The directors will select a president, first and second vice-presidents, a secretary and treasurer and an executive committee of five, as well as committees on sales, manufacturing, and finance."

"What financial provision have you made for carrying on such an immense enterprise ?"

"We propose to bond the company for $1,500,000. These bonds will run 30 years and will bear 6 per cent. interest, payable semi-annually, with the provision that at the pleasure of the company they can be taken up at any time at 110. Provision will be made for a sinking fund of $50,000 a year, with which to retire the bonds. Of this $1,500,000 some $600,000 will be used for a part of the purchase and the remainder will be utilized for running the business. Ninety per cent. of the stock of the new company has been taken by the owners of the old companies. The same energy and ability which have in times past insured the success of the old companies will insure the success of the new one."

ODD PLATES.

The Carton Furnace Company of Utica, N. Y., report a satisfactory volume of business thus far the present year as compared with the corresponding period of 1893, the falling off being only 4 per cent. In making this showing the company compare the period this year with the best five months' business in their history. In the number of furnaces sold from January 1 to June 1 of this year there is an increase of 15 per cent. as compared with the same time last year, which certainly speaks well for the popularity of the Carton heaters. Thus far the present year the company

have been shut down only two weeks, and their foundry is now in full operation. Their furnace pipe and fitting departments have been running overtime, and the company report a very small stock on hand, the new venture having proved more successful than anticipated. The fittings and pipes sent out have been favorably criticised, and the company expect to do a large business in this line.

F. E. Browne, 314-316 South Spring street, Los Angeles, Cal., favors us with an exceedingly neat and attractive catalogue with testimonial letters of his steel dome hot air furnace. This is the first illustrated catalogue which Mr. Browne has issued, and in it he states that in the future, as in the past, he will be on the alert to keep in the front rank, anticipating the wants of his customers and making his steel dome furnace occupy the highest and most advanced grade. The heater is especially adapted for the climate of California and burns either soft wood or coal. It has a small fire pot and a large radiating drum of heavy sheet steel, made perfectly gas tight. Three sizes are offered, the smallest being sufficient to heat a six to nine room house, the next size ten to twelve room houses, while the largest size is intended for churches and halls. The greater portion of the catalogue, which is entitled "Comfortable Homes and What People Say Who Live in Them," is devoted to half-tone engravings of residences in Los Angeles which are heated by the Browne steel dome furnace, and facing these views are testimonial letters from the owners of the dwellings. Mr. Browne also calls attention in the closing pages to his large and well selected stock of kitchen and household utensils, and to the fact that he has recently added to his assortment Magee's Mystic range, with which our readers are familiar. Mr. Browne also handles the Prize Royal, Dexter and Royal Grand ranges and the Orient lamp heater.

The Peninsular Stove Company of Detroit have addressed a circular letter to the stove trade, directing notice to their mail order department, a branch of business to which the company are giving particular attention. It very often happens that a dealer in need of stoves holds his order until a traveling salesman calls upon him, but the knowledge of the company's mail order department, where orders received direct command the same careful attention and prompt shipment which characterize those secured by the traveling salesmen, will warrant the dealer in mailing his orders without delay, thus enabling him to supply his customers more quickly than would otherwise be the case. The company state in this circular letter that on account of the extensive territory they are obliged to cover they find it impossible to send a representative into every town, and have therefore established the mail order department. We have received from the company a copy of this circular and also a folder relating to the Peninsular portable wrought steel range, adapted for use of families, restaurants, hotels and public institutions. The goods are made of 14-gauge cold rolled wrought steel and are lined with asbestos.

The Superior Stove & Furnace Company have just been incorporated under the laws of the State of Ohio for the purpose of carrying on a general wholesale and retail business in the sale of stoves, ranges, furnaces, kitchen ware, &c., with office and salesroom at 94 Superior street, Cleveland, Ohio. They have secured the general agency for the State of Ohio of the line of Superior furnaces, heaters and steel ranges made by the Superior Furnace Company of Little Falls, N. Y.

The Star Coupler Company, St. Louis, Mo., are meeting with excellent success in introducing their couplers. In using this coupler in connecting lead to lead pipe, the soldering or wiping of joints is entirely obviated. It is particularly adapted to connecting the range to boiler, and many stove dealers carry them in stock, as they are enabled to sell the range or stove and set it up complete without outside assistance.

The Putnam Foundry & Machine Company, Putnam, Conn., manufacturers of the well-known Plummer steam heater and the Leader hot water heater, have recently completed a new building to be used as a storeroom for patterns and a large shed for the storage of coal and coke. This concern are preparing to bring out a new furnace which will be ready for the market early in July. The furnace has not yet been named, and if any member of the trade has a suggestion and is anxious for the glory of standing godfather for this apparatus, he is invited to send it on a postal card. Mr. Barber has not offered anything in the way of a prize, but doubtless will appreciate the kindness of the trade to the extent at least of giving due credit to the sender of an approved suggestion through *The Metal Worker* and an invitation to the christening.

The Kernan Furnace Company of Utica, N. Y., and with Chicago office at 71 West Washington street, favor us with a descriptive and reference catalogue of the Kernan warm air furnaces for soft coal. The 32 pages of which the little volume consists illustrate and describe the heater named, in addition to which they give the elevations and floor plans of a school house, showing the application of the Kernan system of heating and ventilation. The latest production of the company is the Kernan smoke consumer, for which strong claims are made. In this construction, it is claimed, new and practical results are accomplished, the air being heated and equally discharged into the combustion chamber around the surface of the fire, thereby causing perfect combustion and preventing the formation of soot. In this air passage the claim is made that there are no joints which by contraction or expansion will allow gas and smoke to escape. The grate employed is of hexagonal type, being self cleaning, anti-clinker and rotating bar dumping. The bars are so constructed that air passes between and reaches the center of each. The triangular grate bars are without bolts, suspended within a removable grate frame which can be easily replaced through the ash pit door. The frame is so constructed that each triangular bar has a center support, thus giving three supports to each bar. The closing pages of the pamphlet are given up to testimonial letters, being a few of those received by the company from the soft coal sections of the country.

The Hood Furnace & Supply Company of Corning, N. Y., in referring to the special features embodied in the Cheerful Home improved hot air furnace, state that the line consists of 20 styles and sizes, which have been thoroughly tested by users in all parts of the country. The grate is a triangular revolving bar, cast hollow from end to end. The fire pot is sectional with cup joints and wide flanges, the steel dome has cast wings and the radiator is horseshoe in form, with return flue and down draft, and having automatic gas and direct damper.

E. Bement & Sons, Lansing, Mich., are distributing a 16-page pamphlet of pocket size, containing a number of testimonial letters relative to the merits of the Palace Regal Ventilator square parlor stove. The letters are of a complimentary character, and indicate very forcibly the satisfaction which this stove has given wherever used. The makers state that the reason for this wonderful success is its general superiority of design and construction, although they ascribe it largely to the fact that it is so constructed that the hot air and smoke are exposed for a longer time to a great radiating surface.

The Fuller & Warren Company, Troy, N. Y., have issued a very attractive four-page folder, illustrating the Air Tight Stewart ventilating parlor stove, made in four sizes and intended for using as a fuel hard or soft coal, coke or lignite. The manufacturers state that under test "a fire has kept continuously for 65 hours with one hod of soft coal." The stove is furnished with either cone or draw center grate, as may be desired, and the parts exposed to the heat above the fire pot are cast in one piece, thus insuring, it is claimed, great durability. The circular shows the stove with and without exterior casing. The space between the stove body proper and the outside casing is open from top to bottom, thus compelling a constant circulation of air by direct radiation upward and outward.

For some time past it has been evident that in order to accommodate their increasing business, the William Miller Range & Furnace Company of Cincinnati, Ohio, would have to provide additional quarters. To this end they have recently commenced the erection of a new brick building, which when completed will be six stories in hight. The location of the new edifice is at the corner of Seventh street and Broadway in the city named. The improvements will involve the expenditure of a large sum of money, which is necessitated by the prospective requirements of their business. When the building is completed a force of about 200 hands will be employed. President Miller of the company is reported by a local paper to consider the business outlook good.

Isaac A. Sheppard & Co. of Philadelphia and Baltimore have distributed a four-page circular illustrating and describing the Paragon steel plate furnace. It is made with round and octagon base, the former having a curved cylinder and frictionless draw center grate, while the latter has three different arrangements of grates and cylinders, according to requirements. The Paragon furnaces are well made throughout and embody features which have established for them a gratifying reception at the hands of the trade.

At the international exposition now being held at Lyons, France, is a grill room in which every effort is made to present a complete demonstration of the advantages of gas for cooking and for accessory services. Even the roasts are turned by a small gas motor. The kitchen is in full view of the hall of the restaurant.

TIN PLATES.

SCRAP.

CUMBERLAND STEEL & TIN PLATE COMPANY, Cumberland, Md., report that the demand for their black sheets for tinning purposes is so large that their order books are full for a long time ahead, and they are unable at present to fill the demand upon them. The present capacity of the mills is about 75 tons a month, which will be doubled when their new mills are put in service next month.

THE WORKS of the Burry Tin Plate Company, Llanelly, South Wales, will resume operations about July 1.

AN ENGLISH metal trade journal announces that some large orders for tin plates had been recently placed by American dealers. One purchaser had taken 24,000 boxes and another had placed contracts for 50,000 boxes.

AN AGREEMENT having been reached between the owner of the Abertillery Tin Plate Works, Newport, Monmouthshire, and his workmen, the works have been restarted, after a prolonged shutdown, with eight mills out of the eleven which the works contain.

THE DEATH is announced of a well-known Welsh tin plate manufacturer, whose products are familiar to every one in the trade in the United States—Daniel Whitehouse, proprietor of the Abercarne Iron & Tin Plate Works, Abercarne, Monmouthshire. Mr. Whitehouse, who was in his seventieth year at the time of his death, purchased the Abercarne works 40 years ago and made them one of the most important tin plate establishments in the world. He was the active manager of his mills and a very prominent and highly esteemed figure in the English tin plate trade.

PHILADELPHIA is rapidly assuming an unquestionable position as the Eastern center of the American tin plate manufacturing industry. Nine tin plate works, with an aggregate of 60 tinning sets, are now in operation in the Quaker City. All are reported as being busy and as finding a ready market for the whole of the bright and terne plates they can produce. The aggregate output of these nine works must form an important item in the tin plate supply of the Eastern States.

THE TIN PLATE works of Marshall Bros. & Co., 1156 Beach street, Philadelphia, are reported as being full of orders. Their rolling mills are also kept very busy in the production of black plates for tinning, part of the output being used at home and the rest finding a ready market among the Eastern tin plate makers. Messrs. Marshall's American black plates have achieved a high reputation.

RITER BROS. COMPANY, Philadelphia, Pa., importers and dealers in tin plates and metals, have removed their store and offices from 213 Race street to more commodious quarters at Tenth and Arch streets. The firm now occupy all the floors of a new and handsome four-story building, where they enjoy much greater advantages of space, and where they are prepared to do a still larger trade in their well-known special brands of tin and terne plates—namely, Riter's Roofing, Lehigh Ternes and Riter's Brights, as well as in all kinds of bright and roofing plates.

WITHIN the past two months the Falcon Tin Plate & Sheet Company, Niles, Ohio, have increased their facilities for the production of black plates for tinning by the addition of another pair of tin rolls. They have now in operation three pairs of tin rolls and two pairs of sheet rolls. The company have not as yet entered upon the manufacture of tin plates, but have confined their efforts entirely to the production of black plates, of which they turned out 850 tons in the first quarter of this year.

THE PHILADELPHIA IRON & TIN PLATE WORKS, Hughes & Patterson, Incorporated, Beach and Vienna streets, Philadelphia, issue a neat eight-page pamphlet, printed in red and black, as a price-list and advertisement of the American tin and terne plates made by them. These include their guaranteed plates—namely, H. & P. Best Bright, H. & P. Redipped Roofing and H. & P. Best Roofing—as well as a number of other brands of bright and roofing plates. The tinning plant of the Philadelphia Iron & Tin Plate Works comprises six pots.

THE TIN PLATE WORKS attached to the factory of the Chicago Stamping Company, Chicago, Ill., are busily employed in turning out both coke and charcoal plates at the average rate of about 750 boxes a week. All this product is used up on the spot for the purposes of tinware manufacture. The requirements of the Chicago Stamping Company's own factory are so great that hitherto they have not made any plates for sale. But it is in contemplation to add from 10 to 15 more tinning pots to the 4 now in use in order to supply the general market with high grade American bright tin plates. The company inform us that they have entirely abandoned purchasing imported tin plates and that thus far they have only tinned American black sheets. They express the hope that they may be able to purchase enough domestic sheets to keep their works going.

WORK is progressing actively on the construction of the new rolling mill and tinning plant of the Montpelier Sheet & Tin Plate Company, Montpelier, Ind. The company hope to be in operation by September 1 next, with a four-mill plant and about ten tinning pots.

THE AMERICAN TIN & TERNE PLATE COMPANY, 45–49 Richmond street, Philadelphia, are reported as having five tinning sets in constant operation, with an active sale of all the plates they can make. The company are turning out both bright charcoal and terne plates.

UNDER DATE of June 1, the Phillips Tin Plate Company, 918 Filbert street, Philadelphia, have issued a circular calling attention to the tin and terne plates manufactured by them at their works, situated at Susquehanna avenue and Philadelphia & Reading Railroad, Philadelphia. The concern are now making four brands of bright plates—two charcoal and two coke—and seven brands of roofing ternes, which they refer to as being all of Siemens steel, uniformly coated, resquared and guaranteed to seam and double seam. Five tinning pots are in constant operation, having a capacity of 50,000 boxes annually on single turn.

NORRISTOWN TIN PLATE COMPANY, Norristown, Pa., are busy with their full equipment of seven tinning pots turning out both bright charcoal and coke plates, as well as their three brands of roofing tin.

THE FOUR-MILL PLANT of the Ellwood Tin Plate Company, Ellwood City, Pa., is reported in full operation, turning out daily from 40,000 to 60,000 pounds of black plate, pickled and cold rolled, ready for tinning.

THE AMERICAN TIN PLATE MACHINE & MFG. COMPANY, Linfield, Pa., are reported as busily employed in the production of their specialty—continuous roofing plates, made by the Buckman process. The present capacity of the works is 10 tons per day, but additional machinery is now being placed which will double this capacity.

CHICAGO TIN PLATE MFG. COMPANY, 533 The Rookery, Chicago, expect shortly to join the ranks of American tin plate manufacturers who roll their own black sheets. The firm are, we understand, in negotiation for a rolling mill plant and will in all probability be producing their own sheets by the fall. The present product of the company's tin plate works consists of coke and charcoal bright plates, as well as ternes, to the extent of about 1400 boxes weekly.

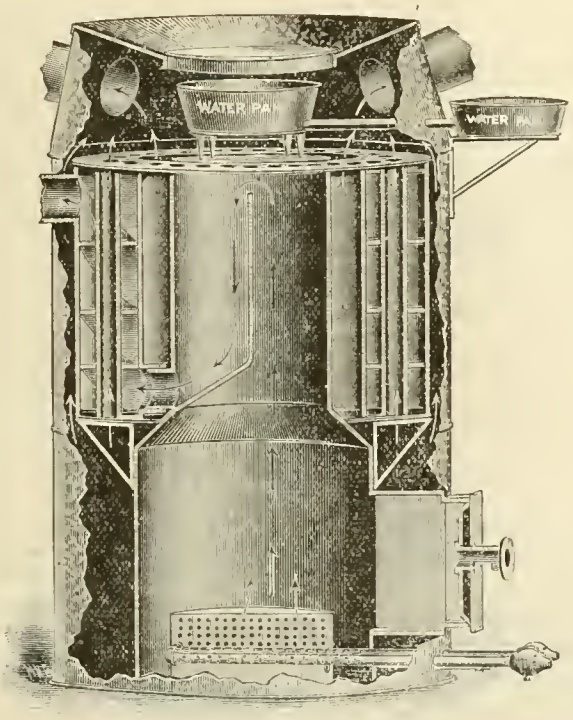
A GOOD EXAMPLE of the artistic tendency in modern trade circulars is found in an attractive 12-page pamphlet which has reached us from C. Sidney Shepard & Co., 23–25 Randolph street, Chicago. The circular is a beautiful specimen of typography and engraving, inclosed in a pale green cover, bearing the firm's name and business stamped in red letters on a silver ground, representing a sheet of roofing terne. It contains an illustrated list of the special brands of American and foreign roofing ternes made for and sold by the company. These include, among domestic plates, Westmoreland, a full weight, heavily coated plate, squared and stamped; Kenwood, a full weight, bright finished terne; Furmston, a terne of Worcester grade, and Apollo. Of imported plates, the well-known brands Worcester, Morriston Old Style and Pontymister Old Style are illustrated and described.

THE CYNON TIN PLATE WORKS and the Nantyglo Tin Plate Works of South Wales restarted this week.

The Spanish Government have proposed the appointment of a mixed commission to settle the difficulty between Spain and the United States in regard to the Cuban tariff.

A Gas Furnace.

The accompanying illustrations show a hot air furnace specially adapted to the use of gas as a fuel that is being put on the market by the Pennsylvania Gas Furnace Company, 77 West Chip



A Gas Furnace.—Fig. 1.—Sectional View.

pewa street, Buffalo, N. Y. Fig. 1 is a sectional view of the furnace, and the company call special attention to the fact that the fire chamber is large and extended and air is admitted to the burners on both sides. A central drum is connected with the top of the fire chamber and extends nearly to the top of the furnace, being crowned with a tight head. This central drum is provided with a partition causing the products of combustion to rise to the top before they can pass down to their exit to the outer drum at the back. The outer drum surrounds the central drum and has a series of hot air tubes passing up through it from the bottom to top. It also has a spiral partition wound four times around its interior, as shown in Fig. 2, by which means the heat of the gases is extracted previous to their taking final exit from the furnace. In this way a very large expanse of heating surface is presented to the cold air which enters at the bottom of the furnace. A very effective means of moistening the air is the arrrangement of the evaporating pan, which is located above the center dome and connected with an outside reservoir. In this way the moisture from the inner pan is distributed evenly through all the pipes leading from the furnace. The dome of the furnace is provided with an opening allowing ready access to the water pan. The outer water pan aids in replenishing with water and also prevents the water from being too quickly raised to a high temperature. It is claimed that the furnace is very durable, as there is no part which ever becomes red hot, and being made of steel plate it responds very quickly to the application of heat. It is said that in five minutes after the gas is burning a current of hot air may be felt in all the registers. Fig. 3 shows a top view of the burners and combustion chamber. A double pipe burner is used with fine perforations, being provided with an air mixer by which the proper amount of air can be supplied. This, with the size of the fire chamber, which provides for an ample flow of air to properly support a flame, produces, it is claimed, a superior combustion and intense heat. The air is admitted to the burner on both sides of the furnace through a perforated shield in fine streams over the top of the

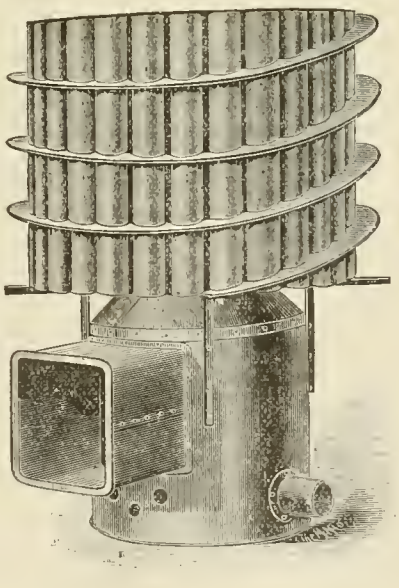


Fig. 2.—Radiating Drum with Spiral Flue.

burner, which gives a large flame. The admission of the air to the burner is said to be a very important feature. The furnace is arranged with a pilot light and devices by which the fire can be lighted from any room in the house. It is claimed that the combuation for an ordinary sized dwelling is from 20 to 40 cubic feet of gas per hour. The furnace is intended to take the place of coal constructions, both portable and brick set. In cost the furnace is said to be considerably cheaper than the average coal burning device, and that with gas at from 25 to 50 cents a thousand feet is more economical than coal, and with gas at 50 cents to $1 a thousand feet the cost of operation compares very favorably with the use of coal, while great comfort is derived from the regular heat furnished, as well as from the fact that no attendance is needed for fires. A number of the furnaces have been in use during the past winter, and they are claimed to have given entire satisfaction. The furnace is made in four sizes, Nos. 20, 24, 28 and 32, with a hight of 5 and 5½ feet and diameters of 40, 44, 50 and 56 inches, the capacity being 12,000, 18,000, 35,000 and 50,000 cubic feet of space respectively, with somewhat increased capacity in churches or buildings more readily heated than the ordinary dwelling.

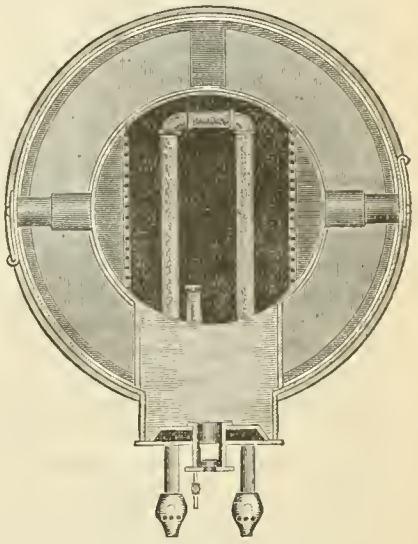

Fig. 3.—Top View of Burners and Combustion Chamber.

The New York and New Jersey bridge, authorized by Congress and approved by the President, will cost nearly $40,000,000, according to present estimates. The company are bound by the terms of the bill to complete the structure in ten years. Moreover, they are required to expend at least $250,000 the first year and $1,000,000 annually until the work is completed. They expect to arrive at this consummation in half the time required by the law.

With the view of warding off distress among the agricultural population in seasons of crop failure, Russian statesmen are preparing a scheme for the insurance of crops by the State. The insurance is to be compulsory so far as farming lands are concerned, the rates varying according to the conditions of the various districts.

At a recent meeting of striking coal miners in Illinois, it was desired to adopt a set of resolutions. In order that all present could vote intelligently, the resolutions had to be translated into French, German, Italian, Belgian and Polish.

PLUMBING and GAS FITTING.

Twelfth Annual Convention of the National Association of Master Plumbers.

The National Association of Master Plumbers held their twelfth annual convention in Detroit, Mich., this week. It was the largest ever held, and significantly demonstrated the growing power of this great organization, whose membership extends from ocean to ocean. Founded in 1883 by comparatively a corporal's guard, anxious to advance the interests of their craft, which they believed could beat be accomplished by organization, the association has grown from year to year, every twelvemonth showing a great gain on the preceding one. The past year was the banner year in its history, numerous localities coming into the fold which had for some reason or other held aloof.

So much has been accomplished, however, in State and local legislation for the betterment of the trade and the weeding out of unskilled or otherwise incompetent men through the influence of the association that its benefits have been too apparent to withstand, and therefore those who have hitherto been indifferent toward the association have latterly been hastening to enter its ranks. The matter of trade protection as embodied in the famous Baltimore resolutions, which in the beginning was a formidable undertaking, has also been prosecuted very successfully, and manufacturers and jobbers are finding it to their best interest to recognize master plumbers as exclusively entitled to handle plumbers' supplies. This work could not have been carried on to its present satisfactory condition without the most able management as well as the most perfect harmony among officers and members. Petty jealousies, bickerings and quarrels have not divided their councils, but unanimity of purpose has been the animating spirit. From this has grown the superb success exhibited by the association as it stands constituted today.

Delegations from the various sections of the country began to assemble at Detroit several days before the time fixed for the formal opening of the session on Tuesday. On the previous Saturday not a few arrived. Their numbers were considerably augmented on Sunday, but a great host made its appearance from all points of the compass on Monday. The Executive Committee of the association held a preparatory session on Monday afternoon at the Hotel Cadillac for the purpose of arranging some necessary details and giving the final touches to the report of their work during the year. This committee consisted of the following members:

President, Daniel G. Finnerty of Boston.

Vice-president, John Mitchell of New York.

Recording secretary, David Smith of Boston.

Treasurer, W. E. Goodman of Milwaukee.

Jeremiah Sheehan of St. Louis.

Thomas H. Radcliffe of Brooklyn.

J. J. Wade of Chicago.

H G. Gabay of New York.

James G. Weldon of Pittsburgh.

M. J. Duffy of Louisville.

TUESDAY MORNING.

The members of the various delegations assembled at the Hotel Cadillac at 9 o'clock, and formed in procession to march to Philharmonic Hall, the place of meeting. It was an imposing demonstration, by far the largest on any similar occasion. It was headed by a band of music, and paraded through a number of the principal streets and past the leading hotels. The different delegations had their banners with them, all wore distinctive badges, and in some cases a feature of uniformity was introduced in the matter of hats. For the first time the Knights of Tabasco, an organization of traveling salesmen in the line of plumbers' supplies, turned out in force as part of the plumbers' procession at a national convention. They had provided their own band, marched with military precision, carried appropriate streamers, and performed entertaining maneuvers with umbrellas decked with crimson ribbons.

On arriving at the hall the convention was called to order by President Daniel G. Finnerty, who looked around with evident pleasure on the large assemblage. The platform on which the officers sat was decorated with tropical plants, the walls were draped with flags and banners, above was a huge canvas inscribed "Welcome, Master Plumbers," but the most charming feature of the whole was a large gathering of ladies in the gallery who had come to witness the opening exercises. In a few well chosen words President Finnerty greeted the assemblage and introduced President J. H. Crumley of the Detroit Master Plumbers' Association, who welcomed his fellow craftsmen in a short speech. He next introduced George Beck, president of the Detroit City Council, who extended a cordial greeting to the association in behalf of the Mayor, who was unavoidably absent. Mr. Beck made an eloquent address, replete with humor and yet highly dignified. During the course of his remarks he referred to his own short career as a master plumber, which was hopelessly checked by the publication of one of his bills, in which he had charged $3.68 for finding leaks in a pipe and 16 cents for repairing the same.

The president then appointed Thomas F. Norris sergeant-at-arms, and Charles Dullea assistant, both of Detroit. A Committee on Credentials was then appointed, consisting of:

T. J. Culloton of Chicago.

W. H. Rothrock of Baltimore.

S. E. Dibble of New Haven.

D. J. Collins of St. Louis.

William McCoach of Philadelphia.

The convention adjourned until 2 p.m. to await the report of this committee.

TUESDAY AFTERNOON.

Chairman Culloton of the Committee on Credentials submitted its report, showing that 389 delegates were present, representing 22 local and 10 State associations. This is an increase of over 30 per cent. in the working membership of the convention in one year. A question arose as to the representation of the State Association of Michigan, which had sent in the names of ten members residing in towns without local associations in addition to three delegates at large. This question caused an extended discussion, which was terminated by the president's decision that the association was entitled to only three delegates.

The complete list of delegates in attendance, as reported by the Committee on Credentials, to which must be added the State vice presidents, who are ex-officio members of the convention, is as follows:

List of Delegates.

CALIFORNIA.

Los Angeles. George E. Howe, F. M. Parker, W. D. Newell, A. B. Cass, F. M. Crimmins; San Francisco, Thomas J. Ford, John L E. Firmin, J. B. Butterworth, P. F. Ward, R. A. Vance, S. Ickelheimer. W. M. Tobin, Charles J. Reilly, H. Williamson, James Shepard.

CONNECTICUT.

Bridgeport, H B. Middlebrook, M. A. Green, L. H. Mills; Connecticut

State Association, James Ahern, S. E. Dibble, John M. Page; Hartford, George Mahl, James F. Duffy; New Britain, J. B. Weiant; New Haven, Andrew J. Clerkin, S. E. Dibble, F. A. Curtiss.

INDIANA.

Evansville, Charles Wahnscidler; Fort Wayne, Robert Spice, E. Martin; Indianapolis, George Kirkhoff, Thomas Clark.

DELAWARE.

Wilmington, James F. Trainor, Alfred Gawthrop.

WASHINGTON, D. C.

J. R. Quinter, E. J. Hannan, J. Ragan, D. Harman, James Nolan, James Cunningham.

ILLINOIS.

Chicago, Paul Redeiske, J J. Wade, Wm. T. Geary, C. J. Herbert, P. Sanders, T. P. Culloton, G. A. Larsen, Thomas Conway, C. C. Breyer, D. J. Rock, P. M. Murphy, A. C. Hickey, J. F. Roland, Jos. B. Breen, M. L. Mandable, E Baggott, J. H. Devmey, J. H. Roche, Wm. H. Cummings, J. G. Weber, A. W. Murray, J. J. Doyle, R. H. Lear, J. P. Newburg, C. J. Boyd; Illinois State Association, John M. Simpson, Robert Loudon, James R. Scanlan; Peoria, D O'Connor, John O'Neil, Jr., Charles W. O'Neill; Rockford, E. S. Gregory.

IOWA STATE ASSOCIATION.

J. A. Harris, John E. Allen, John Burnside, A. H. Walker, Henry Ewinger.

KANSAS STATE ASSOCIATION.

James Foley, P. Bertram, C. J. Prescott, F. H. Bowers.

KENTUCKY.

Henderson, L. C. Klee; Louisville, A. M. Ramsey, S. Shulhafer, John Ryan, M. J. Duffy, Wm. H. Matlack.

MAINE.

Lewiston and Auburn, John B. Smith.

MARYLAND.

Baltimore, W. H. Rothrock, John Trainor, George Knipp, B. N. Sullivan, W. W. Rowles, J. F. P. Carey, E. J. Healy, Jr., C. H. Frederick.

MASSACHUSETTS.

Boston, J. W. French, J. W. Coadon, David Smith, J. F. Dablin, T. E. Sharp, P. H. Winn, E. C. Kelly, D. G. Finnerty, T. J. Hartnett, Isaac Riley, W. A. Tucker, J. S. Boyd, C. M. Bromwich, James O. Connell, A. Williams; Holyoke, C. P. Lyman; Massachusetts State Association, T. J. Carmody, D. D. Casey, J. W. Green; Lowell, Thomas Costello, P. F. Corston, D. H. Wilson, S. H. Jones; New Bedford, F. M. Gifford; Salem, F. A. Wendell; Springfield, W. H. Selvey, M. A. Donohue; Worcester, J. F. Deedy, H. A. Desper, J. W. Jordon, J. C. Luby.

MICHIGAN.

Albion, W. J. Poor; Ann Arbor, T. F. Hutzel, Robert Gwinner; Battle Creek, J. C. Gallup, A. F. Bock; Bay City, W. H. Sullivan, A. Walther; Benton Harbor, A. Brammal; Michigan State Association, James Meathe, John A Wheeler, William Lloyd; Detroit, George Lane, J. W. Partland, T. F. Norris, Richard Walsh, P. C. Stimer, Charles Dullea, J. H. Crumley; Flint, E. Werner; Grand Rapids, F. Shriver, Wm. Robertson, W. T. McGurrin, Warren C. Weatherly; Ionia, R J. Breckon, Loomis Mann; Jackson, S. J. Wirt, G. H. Porter; Kalamazoo, S. M. Radigar, J. Dekman; Lansing, F. C. Bennett, R. H. Black; Mount Clemens, Anthony Czizek, Michael M. Smith; Port Huron, W. Gibson, J. Bradley; Saginaw, C. R. Bridgeman, F. Archard; St. Joseph, M. W. Jackson, W. Dennes; Ypsilanti, J. E Lambert, Wm. Harding.

MINNESOTA.

Duluth, Allen Black.

MISSOURI.

Kansas City, H. Goss, R. B. Farley, George P. Kirtly; St. Louis, D. J Collins, P. Madden, W. Mortimer, E. J. Lonergan, E. P. Reardon, James McCartin, John McMahon, E. Schoeneman, John Quinn, J. C. Mitchell, J. Kelly, J. Shelley, W. F. Stein, J. M Life. E. F. Gardner, C. H. Carroll, E. C. Zausch, Jeremiah Sheehan; Missouri State Association, L. V. Cross, M. J. Ward, C. D. Rogers.

NEW HAMPSHIRE STATE ASSOCIATION.

F. A. Lane, P. A. Gifford, F. I. Lesaard.

NEW JERSEY.

Morristown, W. H. Moslar; Newark, E. Berla, A. Don; Passaic, John Hickman, L. McBride.

NEW YORK.

Albany, H. F. Wescott, Thomas Hyde, J. E. Dungan; Brooklyn, M. Fallon, T. H. Radcliffe, C. W. Evans, J. W. Kelly, W. J. Galt, H. L. Potter, J Zoll, R. J. Knox, W. E. Williams, Oscar O. Sawkins, George Mong, J. J. Keenan, G. B. Lewis, G. H. Smythe, W. Gardner, C. F. Menzinger, Louis Haff, H. J. McBride, John E. Quattlander, H. M. Noble, Edwin Hayward; Buffalo, J. F. Stygall, Jr., C. B. Huck, Charles Ceiger, J. L. Menach, F. L. Byer, George Engel. F. H. Yuhl, A. C. Cranichfeld; Jamestown, John Conway, James Callahan; Kingston, T. J. Cusack; New York, Col. George D. Scott. John Burns, John Mitchell, H. G. Gabey, H. J. Patterson, Charles Schloesser, T. J. Tuomey, William Young, John Yule, E. J. Brady, S. Malcolm, M. Ryan, John McCarron, J. W. O'Brien, Frank Reynolds, Timothy Sullivan, Phillip Smith, J. R. Corbitt, Alexander Cameron, W. McDermott, T. J. McCormack, Adam Huston, J. M. Morton, C. Frazer, T. Martin, E. P. Mahoney, J. Walsh, Jonas A Rossman, W. Kirchoff, C. H. Kranichfelt, T. McCaull, Francis Callahan, John Regan, J. J. Sullivan, James Muir, J. O. Shumway, T. R. DeLacey; Poughkeepsie, T. A. Waters, Peter Adriance, Charles Cook, E. C. Goherty; Rochester, J. A. Barr, J. A. Creelman, George Dodds; Syracuse, B. J. O'Donal, R. C. McClure, F. W. Wagoner.

OHIO.

Cincinnati, Charles Homan, A. A. Deihm, J. A. Gibson, C. L. Heller, Jr.; Cleveland, D. H. Roberts, E. Eller, W. N. Cleveland, W. J. Warden, Chas. Streever; Ohio State, C. C. Dewatoe, L. Poplowski, Robert Raitz; Toledo, J. A. Walt, J. S. Schultz, J. P. Lawrence.

PENNSYLVANIA.

Altoona, H. J. Bohn, Albert Akers; Harrisburg, John A. Kramer; Meadville, Joseph Hampson; Philadelphia, John E. Ryanaon, Wm McCoach, A. L. Hicks, W. M. Harkness, Jr., Wm. L. Owens, Jr., C. W. Barnes, W. H. Doyle, F. P. Brown; Pittsburgh, R. J. Bradshaw, J. O. McGinness, F. J. Gray, J. Rice, Frank McKnight, C. H. Humbert, A. R. Tate, J. J. Cowling, F. P. Blythe.

RHODE ISLAND

Newport, James Openshaw; Pawtucket, David L. Fales; Providence, P. Tirney, J. C. Conroy, F. C. Lees, W. M. Congdon; Rhode Island State, S. Jackson, T. L. Phillips, J. S. Fuller.

SOUTH CAROLINA.

Charleston, O. S. Miscully.

TENNESSEE.

Memphis, J. A. Bailey; Nashville, M. P. Baine, G Denerich.

TEXAS STATE ASSOCIATION.

C V. Ackley, A H. Wainright, J. F. Madden, Thomas Henderson.

WISCONSIN.

North Shore, John Eiden, C. H. Goodman; Milwaukee, Charles Poluchek; W. E. Goodman, Fred Wittig, W. H. Halsey, A. R. Schwind, E Crassler, L. H. Plum; Racine, H. Raymond, C. Hullett; Northwestern of Oshkoah, W. S. Patterson, J. F. Ahern, M. A. Dunning; West Superior, Joseph Neil.

The following Committee on Resolutions was next appointed by the president:

E J. Hannan of Washington.
Edwin Hayward of Brooklyn.
S. L. Malcolm of New York.
J. Warren French of Boston.
L. B. Cross of Kansas City.

The following Auditing Committee was also appointed:

John Trainor of Baltimore.
J. A. Harris of Sioux City.
R. J. Knox of Brooklyn.

An adjournment was then taken until 9 o'clock Wednesday morning.

WEDNESDAY MORNING.

The delegates gathered slowly in the convention hall this morning, and it was nearly 10 o'clock when the president's gavel called them to order. John Trainor of Baltimore moved a reconsideration of the vote by which the report of the Committee on Credentials had been adopted. The discussion of this question consumed much time and required a roll call for its settlement, but it was defeated.

Edwin Hayward of Brooklyn, chairman of the Committee on Essays, reported that contributions had been received from Dent Yates of Kansas City, P. L. Moffitt of Brooklyn, S. E. Dibble of New Haven, ex-President Jeremiah Sheehan of St. Louis, Theodore P. Watts of Louisville, L. F. Meyer of Milwaukee, C. C. Dewstoe of Cleveland, the Sanitary Committee of the Master Plumbers' Association of Worceater, Mass., John L. E. Firmin of San Francisco, and E. J. Healy, Jr., of Baltimore. The time for hearing these essays was fixed at 1 o'clock on Thursday afternoon.

Alex. W. Murray of Chicago, chairman of the Sanitary Committee, read the following report, which was signed by himself and A. C. Hickey, M. L.

Mandable, David Whiteford and T. C. Boyd:

Report of the Sanitary Committee.

Your Sanitary Committee respectfully report as follows: Were it possible for your committee to intelligently investigate every subject that might properly be within the purview of the little "Sanitary," a proper discussion of the report would demand too much of the limited time of this convention.

Article 2 of your constitution contains the theory by which the office of Sanitary Committeemen was established. One of the tenets being "This association is organized for sanitary purposes," it is therefore the duty of the members to qualify by training so that their sphere of usefulness may be enlarged, and be able by logical reasoning to convince the public of the benefits to be derived from the adoption of improved methods of construction, the best quality of materials, and of the importance of employing skillful workmen. The tendency of the age being to the encouragement of the specialist, by which greater perfection is attained in the useful arts, the public expect from the hands of the plumber the same rate of progress in ministering to their comfort, but to be properly qualified to judge which are the correct methods for obtaining perfect sanitation in house construction requires more talent than has yet been developed in any one man. Therefore when the source of water supply has been discovered and the chemist has analyzed its properties, and the physician has stated that it is good for domestic use, it yet requires the plumber to be intelligent and skillful in the use of the material and appliances for it to be stored and utilized and the final disposition of its wastage, so that the education of the craft, beginning with the apprentice, should ever be one of the fundamental principles of this association. And while this association is doing its part by self-training, it is evident that the public, to be fully benefited, must encourage the enactment of such laws that will prevent the ignorant and unskilled from supervising or practicing the art of plumbing, making the examination of those engaged in plumbing and house drainage by a competent board compulsory; requiring the issuance of certificates of proficiency to those who have passed a creditable examination; granting certificates for work properly executed and compelling a periodical inspection of buildings by the sanitary police.

Words of ours are not needed to convince the plumber of the many benefits mankind would derive from the general practice and adoption of the foregoing, because his every day experience has given evidence of their necessity; but the public have not the same opportunities to observe the causes demanding such strict measures. It is irrational to expect an inexperienced or slothful workman to do a first-class job, though he had the best of material to use. Were they compelled by law to have a diploma certifying to their ability, it would give more assurance that the concealed work, as well as that which is exposed, had been properly done, and if to this was added the certificate of the Department of Health that the work had stood the properly applied tests and was executed in accordance with the sanitary code of the city laws, badly executed plumbing would disappear.

House to house inspection would lead to the detection of much that causes sickness and death. It would discover the clogged and leaking sewers, waste and supply pipes, thousands of plumbing fixtures and ice boxes without traps, thousands of water closets reeking with filth and without sufficient water supply, hundreds of basements used as the public dump of the building, many of which germ beds of disease are simply used as storage for fuel. Yet too many are the storage rooms of many food products, and of those that are the kitchen of the gilded restaurant and saloon, their name is legion.

House to house inspection, with authority to remedy these evils, would do much to lessen the epidemics of smallpox, fevers and cholera. Much of the defective supply to water closets in buildings of some cities is caused by waste of water from leaking faucets or pipes. Their dribbling leaks make the premises damp and prevent the water flowing to the upper floors of buildings. The general use of water meters would very much reduce this waste and afford an abundance of water where there is now a scarcity. The disposal of waste water from ice boxes or refrigerators does not receive as particular attention from the householder as its importance from a sanitary standpoint deserves. When making examinations of premises a close scrutiny of the manner of getting rid of the waste from the ice will reveal much that is defective.

A general word on sanitation: Wherever man inhabits the earth effective sanitation is visible, either in a low death rate where civilization and the advancement of the race is marked, or the opposite. Where a low grade of humanity congregate together and disregard the laws of sanitation by living in filth the death rate will be enormous. Especially will the hand of death show itself should an epidemic stalk abroad. Cleanliness, pure air, pure water, healthy food and proper clothing are the first laws of sanitation, which must be obeyed by the human family if they want to be healthy. Do you consider how the laws of nature shake off the cloak of disease from her shoulders? For instance: Contaminate a pure stream of water with any vile substance. Note that the very instant you stop polluting the stream it begins to purify itself by depositing the sediment on the bottom and throwing off the noxious gases to the air. Before the river has traveled 50 miles nature will have asserted herself and the river will again be fit for man and beast to partake of.

Again, nature inclines to sanitation. Take any large city; the inhabitants contaminate the air by all kinds of gases, dust, garbage, outhouses, defective sewers, polluted water, damp cellars, dead animals and filthy gutters, which are contrary to the laws of sanitation. If this were not remedied man could not live on this earth; because of his own neglect he would perish.

It is of no use to remind you of the disregard of sanitary laws by our forefathers for the past 3000 years; of whole countries being laid waste by black death through their disregard to sanitation. It does not matter whether you disobey them through ignorance or carlessness; whether you live in a hovel or palace, your neglect will find you out. Read ancient history and you will find our words as true as holy writ. Is it not a fact that man is slow to move in the direction of sanitation? Thousands of dollars are lavishly spent in the beautifying of buildings, while the sanitary appliances do not receive the consideration they deserve. There is no question but that the public are slow to get on the fast train, the wheels of which are run on the line of sanitation. But we are advancing slowly, and all along sanitary appliances are being gradually introduced.

The master plumbers have been in the vanguard in advancing sanitary laws and sanitary plumbing for the last ten years, and we believe we have done more than any other class of men to make healthy homes. Even the physicians acknowledge the plumber as a sanitarian in the prevention of diseases. Boards of health and officials consult us on sanitary law. Your committee would recommend that all local associations should take up for the coming year laws governing plumbing and undertake to have them passed through their reapective legislatures and city councils. In conclusion, to make the home of the soul an earthly paradise:

The heart must pump, in temperate mood,
Life blood through each artery and vein,
The stomach wisely fed, with wholesome food
And rest afforded the weary brain,
The body of its wastage purged,
And cleansed by exercise and bathing,
The senses by excess not blurred,
And lungs pure air inhaling.

The recommendations of this committee were adopted unanimously.

C. S. Paul of Los Angeles, chairman of the Apprenticeship Committee, presented the report of that committee, which was read, but on motion was referred back to the committee with instructions to make some changes. Subsequently the matter was referred to local associations.

State Vice-Presidents' Reports.

Reports of State vice-presidents were next called for. Patrick Tierney reported that Rhode Island was well organized, every city having its own local association.

The report for Michigan, made by F. Shriver, stated that great progress had been made in the membership of local associations.

James F. P. Carey, reporting for Maryland, alluded with gratification to important legislation secured.

Complete harmony among the fraternity was reported for Connecticut by James Ahern.

Protective legislation was reported as making encouraging progress in Tennessee by J. L. Park.

The little State of Delaware came up with a very encouraging statement of progress by Alfred Gawthrop.

New Hampshire was shown to be in good condition by the report of R. G. Donnelly.

The Kansas report, by James Foley, dwelt upon the improvement in plumbing work accomplished by the efforts of the master plumbers' associations.

Minnesota was shown by Allen Black to be a rather discouraging field for association work, but there was no evidence of any disposition to weaken his efforts to advance the interests of the general cause.

An entertaining but instructive report was rendered for Massachusetts by John F. Deedy, who gave details of methods pursued in pushing the work of organization in that State.

A very prosperous condition of affairs was reported for Washington, D. C., by James Ragan.

In marked contrast with this rosy statement was the report for Nebraska by James H. O'Neill, who set forth the depressed business situation in that commonwealth.

An excellent report for Missouri was presented by J. M. Life.

Indiana was shown to be a difficult field in which to work, according to Geo. F. Kirkhoff.

A brief but good report on Southern California was made by Geo. E. Howe.

A satisfactory state of affairs in New York was presented by Wm. N. Tobin.

Iowa was shown to be exceedingly well organized by Henry Ewinger, who, however, deplored the slowness with which sanitary legislation was being perfected by the State.

Trade protection appears to be pretty generally enjoyed in Texas, according to the report of Ed. Braden, Jr., who also submitted copies of ordinances of Texas cities governing the plumbing business, to show the progress being made in that State.

An adjournment was then taken until 2 o'clock.

WEDNESDAY AFTERNOON.

A congratulatory telegram was read from President E. Rutzler of the Master Steam Fitters' Association, in session in New York, as follows:

We send congratulations on your successful meeting and hope each association will secure complete trade protection.

A telegram in the same vein was ordered to be forwarded to the Steam Fitters' Convention.

Ferdinand Wittig's report for Wisconsin was then read, setting forth the progress made in his State in the past year, and giving some details regarding specific points of advancement.

E. J. Hannan, chairman of the Committee on Resolutions, then read his report, which covered a number of subjects that had been referred to the committee for their consideration. One relating to apprenticeship was recommended by the committee to be referred to the Executive Committee, to be reported upon at the next convention, which was accordingly adopted. Several resolutions covering proposed changes in the constitution were read, and on motion referred to a special committee of five, to report at the next convention. A resolution from the Master Steam and Hot Water Fitters' Association of the United States, asking the co-operation of the National Association of Master Plumbers in the matter of purchasing supplies, was referred to the incoming Executive Committee with power to act.

A resolution presented by J. J. Wade of Chicago set forth the fact that many architects and builders persisted in specifying foreign pottery, and he therefore recommended the appointment of a special committee of five to investigate the comparative merits of foreign and domestic pottery and report at the next annual convention. The Committee on Resolutions recommended that the resolution be non-concurred in, but that "all master plumbers give their preference to home industries in the purchase of supplies." The convention approved this recommendation by a unanimous vote.

Thos. P. Watts, vice-president for Kentucky, then made his report for that State, showing a very creditable record of work. The condition of association matters in Pennsylvania was well portrayed by J. L. McShane, who also referred in suitable terms to the demise of James G. Weldon of that State.

The report of W. T. Geary for Illinois gave particulars of the recent formation of a State association in that commonwealth, and the gratifying manner in which his efforts in that direction had been supported by the Illinois master plumbers.

The report of the financial and recording secretary, David Smith of Boston, was then read, showing a grand total of dues collected for the past year of $5841. The convention then adjourned until 9 o'clock Thursday morning.

Wednesday evening was pleasantly passed by the members of the association, their ladies and friends at the Ben Hur farm of A. J. Alexander, near Walkerville, Ontario. Mr. Alexander, who resides in Detroit and is known to fame as the manufacturer of the Ben Hur closet, furnished a steamer free of expense for the trip to the farm, and there provided a bountiful repast, which was partaken of at tables spread in a great apple orchard. It is estimated that over 1000 persons were entertained on this occasion by Mr. Alexander.

THURSDAY MORNING.

(By Telegraph.)

Convention was called to order at 10 o'clock. No committees being ready to report promptly it was proposed to begin the reading of essays, but the delegates were not in a mood to listen to them, and by motion a resolution was adopted ordering them printed as part of the proceedings.

The report of the Executive Committee was then read. They reported that they had held four meetings during the year. The first was at Pewaukee Lake, Wis., on June 16, 1893, at which the proceedings of the convention just held were ordered to be printed and distributed, which was done in seven weeks. Also at this meeting the salary of the executive clerk was fixed at $18 per week and the *per capita* tax for the year at $2. Further, the president was directed to write to the presidents of local associations and get the names of all manufacturers of plumbers' supplies in sympathy with the aims of the association. This was done, and a list was afterward printed showing 210 names, to which 16 more were subsequently added. The second meeting was held at Boston, February 13 and 14, at which it was decided that the appointment of a joint committee representing the Master Plumbers' Association and the Steam and Hot Water Fitters' Association was advisable, and the latter association was so notified. At this meeting it was resolved to recommend to the association that representation in the National Convention should be reduced to one delegate to every 15 members in local associations instead of one to ten, as at present. The third meeting was held at Hotel Cadillac, Detroit, June 18, at which it was resolved that the association should furnish all supply houses with lists of members of local associations. A proposition was received from the United Association of Journeymen Plumbers asking for the formation of a joint committee, composed of representatives of the two bodies, to adopt measures for the avoidance of strikes and disagreements; recommending the adoption of a plan of arbitration and also the settlement of the apprenticeship question. The fourth meeting was held at Ben Hur farm, Canada, June 20, at which an appropriation of $500 was made to help to defray the expenses of the Detroit meeting, as the Detroit local association was a new one. The recommendations of the Executive Committee were referred to the Committee on Resolutions, to report what action they might deem advisable.

The following special committee was appointed on the proposed revision of the constitution, to report at the next convention:

Edwin Hayward, Brooklyn.
Paul Redeiske, Chicago.
J. W. McDermott, New York.
H. Humbert, Pittsburgh.
George Knipp, Baltimore.

Treasurer W. E. Goodman next read his report, showing an amount on hand at the beginning of the fiscal year of $3034.20; received during the year, $5907.85; making a total of $8942.05. Expended during year, $4383.21, leaving a balance now on hand of $4558.84. The reading of this report excited much enthusiasm.

A Committee on Resolutions on the death of James G. Weldon of Pittsburgh was then appointed as follows: John Trainor, Baltimore; Wm. McCoach, Philadelphia; J. L. McShane, Pittsburgh, who subsequently reported a series of very appropriate resolutions which were adopted by the convention by a rising vote.

At the suggestion of Andrew Young of Chicago that the association should annually be represented at the meetings of the American Public Health Association, a motion was adopted that hereafter the president of the National Association of Master Plumbers should attend as regular representative of the association.

It was next decided to vote on the proposed change of the basis of representation of local associations in the national convention, when a large majority voted down the attempt to limit the representation to one delegate to 15 members.

The place of holding the next annual convention was taken under consideration, and after the claims of Philadelphia had been eloquently set forth by Messrs. McCoach, Hayward, Cross, Doyle, Collins, Redeiske, Dewstoe and Burns, nominations were closed, making the choice of Philadelphia unanimous.

Paul Redeiske of Chicago moved that hereafter the Executive Committee should endeavor to arrange the time for holding the convention so as not to conflict with other conventions in allied trades, which brought out the statement from the president that he had endeavored to so arrange matters this year, but that it was the fault of other associations that there was a conflict of dates.

Dr. Reynolds, Chief of the Board of Health of Chicago, was then introduced to the convention and made a graceful and complimentary address, stating, among other things, that every year Chicago adds new buildings that if placed in a straight line would extend 50 miles, every one of which is twice inspected during erection under plumbing regulations approved by the National Association of Master Plumbers.

President Finnerty's report for the past year was then read, giving a remarkable statement of a vast amount of work performed in extending the influence and building up the membership of the association. There are now 2921 members, an increase of 464 over last year. Over 100 firms signed the Baltimore resolutions. A vote of thanks was given the president for his able report.

E. J. Hannan, chairman of the Committee on Resolutions, presented a report on the recommendations of the Executive Committee, favoring the adoption of all, but suggesting that with relation to arbitration all such committees should be appointed from local associations and not by the national body. The report was unanimously approved.

The Texas delegation extended an invitation to the association to meet at some point in that State in 1896, promising a very cordial reception and excellent entertainment. The convention then adjourned until 2 o'clock, and immediately after adjournment the members and ladies met in the open air near by and were photographed.

THURSDAY AFTERNOON.

The convention met at 2 o'clock and immediately went into executive session. The doors were opened at 5.10 o'clock, and the first business presented was the report of John Trainor, chairman of the Auditing Committee, who reported that he had found the accounts of the officers correct.

The convention then proceeded to the election of officers. The president appointed as tellers: Frank Reynolds of New York, Edward Baggot of Chicago and T. J. Hartnett of Boston.

Candidates for president were nominated as follows: Daniel G. Finnerty of Boston, John Mitchell of New York, Jas. J. Wade of Chicago, Jas. R. Meath of Detroit, Daniel L. Sullivan of Texas. The merits of each candidate were set forth in eloquent terms by good speakers. Nominations were closed and the balloting began, in which very great interest was taken. Five ballots were necessary to record the choice of the convention, which resulted in the election of John Mitchell, who was then escorted to the platform and expressed his thanks for the honor conferred upon him.

Nominations for vice-president were next made, as follows: William H. Doyle of Philadelphia, and L. B. Cross of Kansas City. Mr. Doyle declined the honor, and moved that the secretary cast one ballot for Mr. Cross, thus making his election unanimous, which was accordingly done. Mr. Cross was then escorted to the platform and thanked the convention for the honor.

The only other elective office was that of treasurer, for which William E. Goodman of Milwaukee was nominated and unanimously elected. Mr. Goodman was escorted to the platform and gave expression to his thanks.

President Mitchell announced that he would appoint as financial and recording secretary Henry J. Petersen of New York, and his choice was immediately ratified by the convention.

Paul Redeiske of Chicago moved that a vote of thanks be tendered the retiring officers, the citizens of Detroit and the press, which was adopted. Thanks were also voted to A. J. Alexander of Ben Hur farm for his entertainment of the association, and to the ladies of Detroit, for entertaining the ladies of the members. The roll of vice-presidents was called, and the delegations from the several States named their choice for the ensuing year. Many were continued from the previous year.

The president announced the following members of the Executive Committee:

Jas. Meath of Detroit.
Henry G. Gabay of New York.
John Trainor of Baltimore.
C. C. Dewstoe of Cleveland.
Paul Redeiske of Chicago.

Adjourned *sine die* at 11 o'clock p.m.

PHILIP SMITH of New York, observing that the president was provided with a gavel of very ordinary appearance, deemed it desirable for the maintenance of the dignity of the office that a better emblem of authority should be in his hands. He therefore procured and presented to President Finnerty a handsome rosewood gavel, decorated with a red, white and blue ribbon.

Pads and Joints.

A PARLOR at the end of the main corridor of Hotel Cadillac was used as an exhibition room, and a greater display of manufactured articles made than has heretofore been customary.

THE ROTUND FIGURE of John Davis of the Windsor Mfg Company, Milwaukee, was seen everywhere, but lead and tin pipe talk was left at the press.

THE SEDATE FACE of the eloquent and humorous Albert E. Hyde relapsed into a genial smile for each plumber, for he knows them all as well as he does the James B. Clow Company's catalogue. His fellow laborer, W. H. Morse, was equally at home with the delegates.

THOMAS SPENCE of the Rundle & Spence Mfg. Company, Milwaukee, left Mr. Rundle at home to make soil pipe and plumbers' brass goods, while he renewed his acquaintance with the fraternity in which he labored when he first worked for shillings.

VALVE BOXES, hydrants, malleable and cast fittings for plumbers and steam fitters are agreeable topics for conversation when talked by Fred Habne of the Illinois Malleable Iron Company, Chicago.

AN ATTRACTIVE square sign with a white background bore in red and black letters, "H. B. Smith Company, Westfield, Mass. Union and Gold Pin Radiators, Gold, Mills and Mercer Boilers and Cottage Heaters." A table beneath was laden with literature and J. H. Towle had a word for all.

A. P. RICHARDSON of the American Boiler Company was at home in every group of plumbers with his smile and greeting, but not a word about the Perfect, Florida, Spence and Soleil steam and hot water boilers.

M. L. FOOTE is an agreeable representative of the heating and ventilating department of the Kewanee Boiler Company, Kewanee, Ill.

GRANT C. BRETTELL showed the Eureka smoke test machine, made by the Bailey-Farrell Mfg. Company, Pittsburgh. It attracted much interest and is highly praised by the Pittsburgh plumbers, who strongly advocate the smoke test in preference to all others. Leaks are readily found that would require careful search with any other method. He also distributed circulars of the Bennett water pressure regulator for delivering water from high pressure street mains through the consumer's service pipe at any desired pressure from 1 pound up. His attractions kept him busy, and he worked willingly to satisfy all, but too hard to enjoy the convention.

A TABLE laden with attractive printed matter was presided over by L. F. Daniels, representing the Boynton Furnace Company, New York and Chicago.

SECRETARY W. EMIL KUGEMANN represented the Ideal Boiler Company of Chicago. He had a large trade-mark in colors on the wall, and an ideal boiler set up and some loose sections to show the construction and circulation. A number of their specialties in valves and regulators were also shown, attracting many visitors to the exhibit.

W. H. HAYES and G. F. HICKMOTT, representing the Hayes Mfg. Company, Paterson, N. J., showed a Wilhelmi copper range boiler, guaranteed to stand 200 pounds pressure, also a section of the boiler showing their method of bracing the boiler and connecting the parts.

J. J. RICKETT, 3948 Fifth avenue, Pittsburgh, displayed all varieties and shapes of his rubber water closet connections on an ingeniously contrived stand made of nickel plated pipe.

CHAS. A. CRIQUI of the Criqui Filter Company, St. Joseph, Mo., exhibited nickel plated samples of their germ proof filter. It can be attached to a sink or lavatory and filter all the water that passes through. The filter is an unglazed china jar, and is

said to work for several months before it needs cleaning, which can be readily done by shutting off the water and removing the filter jar. It is cleaned by a brush, or if thickly coated fine emery paper will clean it.

G. F. HICKMOTT showed samples of the Brockton files and rasps for soft metals and woods made by Walter Cobb, Jr., Brockton, Mass. He showed one that had been in use a year that cut free and did not clog when used on lead.

SECRETARY J. E. HOLLAND had a sign, "Holland Radiator Company, New York and Chicago," hung on a column around which was grouped samples of the Holland radiator in different styles of decoration. The advantage of their method of construction and connection was explained to all.

COL. W. T. MCGURRIN of Sproul & McGurrin, dealers in plumbers' supplies, Grand Rapids, Mich., showed circulars of the Excelsior grease and sewer gas trap and the Salvage closet connection. The closet connection was shown complete, and is for repairing earthenware closets when the flush or revent horn is broken. It is very easily attached.

THE HYGEIA FILTER COMPANY, Detroit, Mich., had samples of their filter on exhibition both for use on one fixture or for filtering the water supply of a building. G. L. Benedict explained its operation and distributed a 12-page pamphlet showing sectional views and thoroughly explaining its advantages, construction, operation and method of attaching it.

EMMETT MARTIN, Fort Wayne, Ind., showed a catch basin and back water trap that received considerable attention.

JOHN COYNE, representing the Detroit Lubricator Company, showed a line of steam and hot water valves to the delegates.

W. P. POWERS of the Powers Duplex Regulator Company, Chicago, was present and showed his regulator in connection with the Ideal boiler of the Ideal Boiler Company, in charge of W. Emil Kugeman.

JAMES H. DAVIS, the Western manager of the Standard Radiator Company, Buffalo, N. Y., came from Chicago and had a Turkish rug on which he displayed the New Standard radiator in a single loop decorated with gold brouze and silver bronze ornamentation and a three-column radiator decorated in the same style. The four-column radiator had a silver bronze background and gold ornamentation. These radiators are all tested by a pressure of 75 pounds alternately of steam and cold water before shipment. The company have recently put in operation a 75-ton cupola, which doubles their output, and their orders have kept them working overtime for several weeks. Their yearly capacity will now reach about 3,000,000 feet of radiation.

A STEEL BATH finished in handsome style was conspicuously displayed in the exhibition hall and the printed matter of the Steel Bath Mfg. Company, Detroit, was freely distributed. The tub spoke for itself, its many advantages being readily seen by the plumbers.

A. C. JOHNSTON and F. W. Herendeen of the Herendeen Mfg. Company, Geneva, N. Y., Chicago house had a Faultless Furman boiler in the exhibitors' room. They distributed a neat leather card case containing a circular of the Furmau., Jr., hot water boiler and the dimensions and ratings of the Faultless Furman steam and hot water boilers.

IN THE center of the exhibition hall, so that all who came down from the hotel could see it, a picture of the Capitol Building in a quartered oak frame was hung above the mantel with an American eagle holding the Star Spangled Banner above it. The frame bore a horseshoe in red with the words "Capitol Luck" on each side. Below, and in front of this attraction, the United States Heater Company of Detroit showed their Hecla and Mascot steam boilers and two sizes of the Capitol hot water heater. These were lighted inside by electric lights and red ribbon was used to show the passage of the products of combustion through the heater. On a table in front a display was made of the Capitol steam and hot water valves, altitude gauges and thermometers, with catalogues and circulars. The features of the rocking and dumping grate, grate surface, style of fire surface, draft flues, separating chamber and construction were explained by J. H. Bacon and A. T. Henderson, who had many interested inquirers.

THE J. H. MCLAIN COMPANY of Canton, Ohio, made a fine exhibit of their hot water and steam heaters. Five samples were shown, comprising the Harvard, Humber, Yale and Sandow for hot water and the Cambridge for steam. These were all painted white, with bands and letters gilded, making an extremely attractive showing. For the purpose of showing their interior construction an incandescent electric light with a long wire was available, which was in almost constant use when any plumbers were near, as everybody desired to see how fire pots looked and how circulation was provided for. A brand new catalogue, elegantly gotten up, was distributed on this occasion. C. B. Matteson was in charge of the exhibit and presented each caller with a morocco bound memorandum book as a souvenir.

IN PARLOR M, J. E. Zimmerman had a fine display of flush tanks in a variety of styles and shapes, and water closets, with a line of plumbers' brass specialties and the Ideal easy packed quick opening radiator valves.

CIRCULARS were distributed by W. A. Kelly, Cleveland, Ohio, of the Electric water closet, which was set up for inspection in operation at the Detroit Lead Works, not far away.

WM. KERR, Cleveland, Ohio, showed samples of a patent sink and basin trap that is a good grease trap and is sealed by a ball when the water seal is broken.

H. A. DESPER, Worcester, Mass., showed a soil pipe testing valve that is just the thing, and Balsago is a material that is said to make soil pipe air and water tight.

E. C. MILLER showed a variety of soil pipe fittings made by the Perfection Cleanout Company, Haverhill, Mass., every one showing how their Perfection cleanout is used on L's, Y's, one-quarter and one-eighth bends, traps and double hubs. He also showed the Perfection roof collar, with which a tight connection can be made.

H. B. STOCKWELL represented Charles Royle, Brooklyn, and Wm. Foerster & Co., New York, and showed a handsome line of brass gas fixtures and glass globes.

THE HYGIENE GAS STOVE COMPANY, Pittsburgh, showed a gas stove adapted either for cooking or for heating soldering coppers or melting solder in the metal pot.

THE INSTANTANEOUS WATER HEATING COMPANY, Chicago, had a sign 5 feet square above their exhibit which had a black velvet background with their water heater setting above a bathtub in bas-relief made of silver plated sheet metal. The name and the addresses of the company in New York and San Francisco and in Manchester, England, Brussels, Belgium and Paris were made of silver plated letters, as also the legends "Eight Years' Test" and "You Light a Match, the Heater Does the Rest." The Douglas No. 2 and No. 3 water heaters were shown in planished copper and a nickel plated Sectional No. 2 was on exhibition to show the operation. Three new heaters were shown for the first time under the name Acme. The No. 9 is adapted for boiling water, and is fitted with a shower and thermometer when required. The No. 7 is adapted for bar and restaurant use. The No. 6 is made for doctors, dentists and barbers. All of the Acme heaters are designed for connection with the water service pipe of a building. The Perfect gas controller, in scarlet paint and gilt lettering, made by the Brownhill Company, Chicago, was shown in connection with this exhibit. It is designed to automatically control excessive pressure, and testimonials in the circular speak of a saving of 15 to 40 per cent. in gas bills.

THE AMERICAN RADIATOR COMPANY, Chicago, were well represented by Clarence Wooley, who recently returned from a visit among the trade abroad, and he speaks highly of the reception given him. He was assisted by Sam Hopper, Charley Foster, S. K. Pitman, Clarence Carpenter, Ed. W. Sumner and John B. Dyar. The new Detroit flue radiator was the center of attraction, and is a handsome sample of the Renaissance style of ornamentation. It rested on their latest window radiator, and was surrounded by the plain fluted National, Detroit, Detroit direct-indirect Ideal and Perfection radiators. They were decorated in rose, olive, oxidized silver, chocolate, copper and gilt with the relief portions in tints.

THE KNIGHTS OF TABASCO were everywhere at the right time and are very popular. President Finnerty said their good fellowship entitled them to the right of the line in the parade, but with becoming modesty they brought up the rear, carrying umbrellas with red ribbon streaming from the ferrule, and marched with precision to the music of their band, led by Old Pepper T. J. Cushing, and marshaled by the other Peppers. They went through a very pleasing drill in opening and closing the umbrellas and keeping time to the music with them.

NICK SPANG detected an old plumber's helper that he knew, and invited to join him in guarding the rear of the Knights of Tabasco as they marched.

LOUIS W. GAY, one of the "Peppers," is an engineers' supply man from Buffalo.

GEO. L. BOTTUM, the general agent of the John Douglas Company and the Lausten Lead Works, Chicago, is both "hot stuff" and an all around plumbers' supply man.

CHARLES S. SIDDONS, Buffalo, N. Y., representing the Buick & Sherwood Mfg. Company, Detroit, and their Success tanks and seats, says he is lost in Detroit, the East being his field. Little Charley is one of the "hot stuffs."

OLD PEPPER T. F. CUSHING, representing the John Simmons Company, New York, pipe fittings and brass goods, took T. J. Cusack, a Kingston, N. Y., plumber, out for a drive to see the city.

G. W. YOUNG of the Standard Mfg. Company, Pittsburgh, Pa., dropped enameled baths and plumbers' goods and worked for the Knights of Tabasco

THIS was the first opportunity for the Western salesmen to join the Knights of Tabasco, and 100 new members shows its popularity.

E. F. ACKARD, treasurer of the Saginaw Hardware Company, was a delegate from Saginaw and envies a Knight of Tabasco his honor.

THE KNIGHTS of TABASCO, led by A. E. Hyde, entertained all on the moonlight excursion by their vocal music. The boys are use to telling sweet stories in perfect harmony.

THE PORTERS at the Cadillac were told to watch for any one that had two pairs of shoes on, as one prominent Connecticut plumber lost his, which seems rather strange, too.

THE RICHMOND STOVE COMPANY, Norwich, Conn., were well represented by Thomas J. Douglas, a Tabasco Knight, who made an occasional remark on Richmond Sectional and Victor steam and hot water goods.

"JIM" SMITH was the way he was known to the Tabascos, but to the trade he represents the A. Harvey's Sons Mfg. Company, Detroit, steam, gas and plumbing goods and heating apparatus.

T. F. KELLY of the L. Wolff Mfg. Company, Chicago, is a good dancer, and as popular with the ladies as he and his line of goods are with the plumbers. He is so genial that without his badge he would not be known as "hot stuff."

JOS. E. LEE, who assisted the ladies' entertaining committees, drove the writer around among the hotels to see the ladies.

who had arrived, in order to make proper arrangements for their amusement. The work is better than either plumbing or newspaper work.

A HORSE CHESTNUT suspended from a red ribbon was a unique reminder of the presence of the Buckeye State plumbers.

WHEN the parade passed the office of the Cleveland Faucet Company their front was filled with their people, who cheered a welcome.

"HAHNE & Co., Steam and Hot Water Heating," was what the lettering on the show windows said, but a fine display of modern plumbing fixtures was what appeared as the parade passed.

"ALL TO THE FRONT" must have been the order when the parade passed the headquarters of the James B. Tufts Company, Boston, for their door was filled and a merry welcome shouted.

ALLEN BLACK came alone to represent St. Paul, Minn., and if the plumbers at home knew of the reception that awaited him he would have had plenty of company.

JOHN A. KRAMER, 912 North Third street, Harrisburg, Pa., makes a specialty of steam and hot water heating in addition to plumbing.

ALEXANDER DON, Newark, N. J., is a steam and hot water heating man who can show a number of successful jobs in fine residences.

C. H. KRANICHFELD of the New York City delegation, though from the neighborhood of the late "Mother" Mandlebaum, Rivington street, is a sound theologian, as John Michell's partner, friend McMein, can testify.

AS HAPPY a gentleman as attended the convention was Geo. P. Kirtley of Kirtley Bros., sanitary and contracting engineers, Kansas City, Mo.

THE TRADE-MARK of the Kennedy Valve Mfg. Company, New York, in red ink, adorned the card presented by Charles P. F. Cushing, who can talk business in a very entertaining manner.

J. N. GLAUBER and ALEX. M. BUCHMAN represented the Glauber Brass Mfg. Company, Cleveland, Ohio, and they did not "stop and waste" any time, but were alive to all that was transpiring. They had a large sign hung across the entrance to the exhibitors' room showing a picture of a Glauber stop and waste with the name of the company, their specialities and words of welcome.

THE A. A. GRIFFING IRON COMPANY, Jersey City, N. J., could have no more acceptable representatives at a convention than their Western manager, Frank E. Somers, and M. H. Houghtaling from the Chicago house. The Bundy radiators will not be forgotten or held in low esteem after meeting them.

THAT GOOD GOODS come in small packages is true, as any delegate can testify of J. K. Finney, who represents ably the L. M. Rumsey Mfg. Company of St. Louis. His manners are like the brass goods of his house, highly polished and the genuine article.

"SANITARY SPECIALTIES, Brass Pumps and Plumbers' Supplies Manufactured by the Henry Huber Company, New York," was on the cards presented to every delegate by John Emig.

D. T. RODGER of 11 Lafayette avenue, Detroit, makes a specialty of steam and hot water heating in addition to plumbing.

A. B. PIERCE was greeted on every side by friends who know him and the line of plumbers' brass goods made by his house, the N. O. Nelson Mfg. Company of St. Louis.

CHAS. I. HOBKIRK talked the improved Rider and Ericsson hot air pumping engine in the interest of Delamater Iron Works, 87 South Fifth avenue, New York.

JOHN HICKMAN, President of the Paterson, N. J., association, and Samuel L. Malcolmson of the New York delegation, visited the Order of Chosen Friends and made speeches.

BERTRAM represented Wichita, Kan., and thoroughly enjoyed meeting plumbers from all over the country.

PRESIDENT HENRY P. COPE and J. E. ZIMMERMAN of the Ideal Mfg. Company, Detroit, whose trade-mark is a triangle with their name in it amid a cloud and with rays shooting from it, distributed "A reserved seat at the Cadillac." It was a little book devoted to their Ideal seats. The card they presented spoke of the Ideal lines of seats, tanks, valves, hose reels, iron toys and novelties.

N. HAAS of West Bay City was proud of belonging to the first association formed in the State of Michigan.

IN THE MATTER of badges the delegates to this convention had endeavored to outshine any of their previous efforts, and they succeeded admirably. Much originality was displayed in designs, and many were exceedingly artistic, worthy of being preserved as souvenirs of the occasion.

THE Chicago delegation traveled in its own train to Detroit, by way of the Wabash Railroad. The special left Chicago at 10.25 on Monday morning and arrived at its destination at 5.10 in the afternoon, making a remarkably quick run. The delegation was a large one and was swelled by considerable additions from other parts of Illinois and States further west, as well as a goodly number of ladies. Plenty of room had been provided, however, and the trip was made exceedingly pleasant by the unremitting attentions of the railroad officials, supplemented by the watchful care of the Committee of Arrangements of the Chicago Master Plumbers' Association. The rapidity of this journey would nevertheless have been an unpleasant feature if it had not been for the very smooth roadbed and well kept rolling stock of the Wabash Railroad.

TREASURER W. E. GOODMAN when presented to President Elias Berla and Secretary Alexander Don of Newark, N. J., and President John Hickman and Levi McBride of Paterson, N. J., said: "I am glad to meet representatives of a good State, and expect to hear of increasing associations with such men to work for the cause."

THE FOLLOWING letter was inclosed in an envelope with a neat calf bound memorandum book, having celluloid mosaics showing cuts of the gas machine and the hot water heater made by the Detroit Heating & Lighting Company: "Extending to you, as one of the delegates to the twelfth annual convention of the National Master Plumbers' Association, our best wishes, we herewith inclose a slight memento, which we trust will serve in the future as a pleasant reminder of your visit to the beautiful little 'City of the Straits.' We trust that the first memorandum entered in the book will be the date upon which you will favor our factory with a call during your stay here. We can assure you your call will be appreciated, and you will find us at home."

A HANDSOME vest pocket memorandum book was distributed among the delegates with the compliments of the Maryland Pottery Company, Baltimore, Md. Their trade mark, composed of their name and address and the word "Heath" used four times arranged as a diamond around their monogram with the words "Vitreous China" beneath, was printed in a tinted ink in the middle of each page. At the top and bottom of the page in red ink brief sentences extolled the merit of their sanitary vitreous china goods. They also distributed a little book on the qualities and defects of sanitary earthenware and the superiority of vitreous china. Secretary M. J. Brown, Jr., and John H. D. Rowan were in charge of their exhibit of front and back washout and siphon closets, plain and decorated, with and without vent and right and left hand, lavatories round and oval and urinals. Vitreous china is claimed to be a hard, vitrified, non-absorbent material, impervious to all deleterious matter, that positively will not craze or fall to pieces from "wet rot." In the manufacture a temperature is carried that is said to be 50 per cent. higher than is required with ordinary ware, and the goods are fired for more than twice the usual time in order to endow them with the superiority that is claimed for them.

WM PALMER, representing the American Tube Works, Boston, Mass., distributed a catalogue giving a list of sizes, weights and strengths of seamless drawn brass pipe for plumbers among the delegates. It contained the names of prominent plumbers who have used the pipe and the buildings where it is used. The delegates say that brass pipe is coming into more general use.

THE MASTER PLUMBERS OF WORCESTER, Mass., value membership in their association at a good stiff figure. Their initiation fee is $250. They report that they have consequently received only good material in their local association, the interest taken in its proceedings being so intense that they very seldom have any absentees from the regular meetings.

FRANK DU BOIS, representing Du Bois & Darrow, the newest plumbers' supply house in New York, visited some of the manufacturers in the city whose goods they are the Eastern agents for.

W. B HUBBARD, representing Peck Bros. Company, New Haven, Conn., and his wife were the guests of the delegation from Boston and vicinity.

A REPRESENTATIVE of the Oster Mfg. Company, Cleveland, distributed circulars of their patent adjustable die stock, which does not need to be unscrewed to remove after the thread is cut on the pipe.

MARK E. MONASK represented the Van Auken Steam Specialty Company, Chicago, and all the delegates received his card.

THE PERSUASIVE ELOQUENCE of John Mitchell of New York was never heard to better advantage than on Tuesday afternoon, when he championed the cause of the delegates from the State Association of Michigan. In polished phrase and with fine oratorical effect he pleaded for the larger representation for Michigan, and if the way had been clear would no doubt have carried his point with ease. But the law, as laid down in the constitution, prescribed a different course for the association and his magnificent effort was put forth to no effect.

THE EXCURSION on the Detroit River on Tuesday evening was a very enjoyable event. The pleasure steamer "Promise" was crowded with plumbers and their friends, their wives and their sweethearts. A large dancing floor formed part of the steamer's accommodations and it proved a constant attraction to the excursionists. The weather was apparently made to order for the occasion and could not have been better. The fine harbor and the exquisite panorama of the water front along Detroit and Windsor excited the enthusiasm of the visitors.

A VERY ACCEPTABLE SOUVENIR was distributed by the Mount Heater Company of Detroit. It was a hard rubber paper cutter and envelope opener of just the shape and pattern to do the work satisfactorily. The company also presented the members of the convention with copies of their latest catalogue, a handsome publication of 36 pages, devoted solely to hot water heating. The several styles of heaters made by this company are illustrated in sectional and perspective cuts, and their special points of merit are fully set forth.

JOHN B. SMITH, Lewiston, Maine, sported a cane presented at the Water Works Convention, at Boston last week, by the Ross Valve Company, Troy. The handle was an aluminum valve.

THE "CLEAN SWEEP MAN" was the way A. C. Cogswell was generally known. He represented the Detroit Sanitary Supply Company, Detroit, makers of the Clean

Sweep non-siphon sewer gas trap and sanitary specialties.

FRED. J. STROEBEL, representing the Royal line of steam and hot water boilers and hot air furnaces, made by Hart & Crouse, Utica, N. Y., was at home among the plumbers. He put both steam and hot water catalogues on every seat at the convention hall on Wednesday and they received no little attention.

THE SIOUX CITY, IOWA, delegation wore a pin to hold their badges representing a hog resting on an ear of corn as emblematic of one of the industries of the Hawkeye State.

"WHAT CONGRESS HAS DONE," was a book of empty pages given by the Niagara Radiator Company, Buffalo, N. Y., written by their manager and distributed by Frank C. Perew and F. G. Haywood.

C. BIRKERY of the Birkery Mfg. Company, Hartford, Conn., and O. H. Jones distributed a very neat vest pocket match case showing a cut of the Birkery ball cock, under which was "There is no match for the Birkery."

JOHN L. E. FIRMIN, San Francisco., Cal., is one of the well known men at the conventions. He was with bachelor John Crimmins of Los Angeles, Cal.

"IT LOOKS IMPOSSIBLE BUT IT CAN BE DONE," caused a search for the coins to be passed through the hole in a cardboard problem given out by the Herendeen Mfg. Company, Geneva, N. Y., which also spoke of the Faultless Furman boilers.

"GOOD CENTS AND DOLLARS buy the Dunning boilers for steam and hot water heating, made by the New York Central Iron Works Company, Geneva, N. Y.," was on a neat coin purse distributed by C. H. Williams, who was everywhere that the plumbers went and always genial.

M. A. DUNNING was one of the delegates of the Northwestern M. P. A. who is a hardwareman and a heating engineer as well as a sanitary specialist.

MISS JENNIE H. MIDDLEBROOK, daughter of Major Middlebrook of Bridgeport, Conn., was the designer of the badge worn by that delegation, and "handsome is as handsome does" is indisputable in this case. She enjoys the distinction of being the only woman to hold office in her city, being the assistant town clerk.

MASTER WILLIE WATTS, Louisville, Ky., was the youngest plumber at the convention.

TUESDAY AFTERNOON the ladies were surprised by a fine lunch provided by the Buick & Sherwood Mfg. Company of the city of Belle Isle, where the group was photographed and the ladies left their addresses so that a copy could be sent to them. This was a very pleasing feature of the drive.

C. H. KALVELAGE, representing the Hoffman & Billings Mfg. Company, Milwaukee left plumbers' and steam fitters' supply talk at home and enjoyed the geniality that was a feature of the convention.

S. RESEK, representing the Farnan Brass Works, Cleveland, Ohio, was always in sight when either fun or business was going on.

A. E. SMITH, representing the Vulcan Company of New York, showed their gasoline torch and as a result sold a large number, and circulars of it were in demand.

J. P. NEWERBERG of Reich & Neuer berg, 862 North Halsted street, Chicago, was one of the active representatives of the fraternity.

JOSEPH NEIL, West Superior, Wis., said that the warmth of the greetings at every hand reminded him of good solder at the right heat for wiping.

THERE were few strangers to H. S. Van Volkenburgh, who did not let the interests of the improved Bolton hot water heater suffer, as the Nashville Machine Company, Nashville, Tenn., will appreciate later.

JOSEPH RICE, 653 Third avenue, Pittsburgh, was shown the points of interest in the city by J. B. Lawler, a Detroit journeyman plumber who learned his trade in Pittsburgh.

JAMES W. PARTLAND, East Congress street, Detroit, has recently completed a very handsome sample room with marble trimmings and has lavatories, baths, water closets, sinks and laundry tubs set up in the best of style and was just finishing the lettering on a very handsome sign in colors and gilt on his plate glass show windows in honor of the convention.

FRANK WALSH, 45 West Congress street, Detroit, made a fine show of plumbing goods in his window and set an example worthy of being followed in having blooming plants and vines arranged to relieve the effect. He may not be to blame for it, as he is quite a horse lover and a young lady presides over the office, another worthy example. A drive with Mr. Walsh is very pleasant.

JAMES F. TRAYNOR of Wilmington was the sole representative from Delaware, but the blue hen's chicken can scratch for the brood. He does steam and hot water heating and has a $20,000 contract on hand.

THE NIAGARA RADIATOR COMPANY, Buffalo, N. Y., displayed four of the Niagara radiators on a Persian rug. These radiators are of the rococco design and were of different hights and ornamented with silver and gold bronze on green, brown, olive and cream colored grounds. These radiators are all prime surface and are of the flue construction with ample air space. The waterways are designed to facilitate circulation and the end sections being solid they present a neat appearance. The central sections are of the three-column style. They attracted many observers, and their merits were explained by Secretary Perew and F. G. Heywood, the Western manager, who came over from Chicago to meet his old friends.

JOHN HICKMAN, president of the Paterson, N. J., Master Plumbers' Association, showed the "G. & V." plumbers' pipe clamp made by Gardenier & Vermenlen of his city, and distributed circulars showing their use and advantages. The helper don't have to hunt for bricks to hold the pipe or brass work when a set of these clamps are in the tool bag.

T. H. HUZE and V. M. WELLMAN just suggested that sanitary specialties could be had by applying to the C. F. Hunger Company, Cleveland, Ohio.

THE DAVIS HOT WATER COMPANY, Racine, Wis., put a circular of the gas hot water heater for domestic use on every chair in the convention hall.

T. F. CASSIDY, inventor of the Champion clamp machine, sold by C. A. Bray, Boston, Mass., showed how straps for 68 sizes of lead pipe could be made from brass strips with this machine cheaper than tacks could be used. Continuous straps, hangers and washers for marble work can be made quickly.

OVER 600 patent Magic basin clamps were distributed by the Glauber Mfg. Company, Cleveland. They will fit any basin, and having a brass spring hold it tight and do not break the pottery.

AT THE Ben Hur farm a Philadelphia hopper closet is used for a flower pot, and nevertheless fragrancy is one of its features. It is mounted on a tree stump.

J. H. MUELLER let the delegates know that the Crane Company, Chicago, ranked in front as a plumbers' supply house.

NEW JERSEY was ably represented by her delegation, and much interest was taken in an impromptu meeting held by them at the Hotel Cadillac with the view to forming a State delegation. The national officers expressed their willingness to lend any assistance possible to this end. Alexander Don of Newark and John Hickman of Paterson can furnish information as to the plan of proceeding, and it is hoped that sufficient interest will be taken by those who do plumbing work to warrant the call of the craft at some point on the seashore in the near future.

IF ANYBODY'S JOB has not been properly done it is because our helper did not have his pads and joints ready for use.

A Solid Delegation.

New York City sent her full complement of 37 delegates to the convention of the National Association of Master Plumbers at Detroit and they were accompanied by the Paterson, N. J., and the Bridgeport, Conn., delegates. The ladies with the party were Mrs. Yule, Mrs. Cameron, Mrs. Blace, Mrs. Delacy, Mrs. Pattison, Mrs. Mitchell, Mrs. Rossman and Miss Byrn of New York, Mrs. Green, Miss Green and Miss Middlebrook of Bridgeport, Conn., and Mrs. Page of Naugatuck, Conn. Through the untiring efforts of John Yule two cars were chartered and ample refreshments were provided for the journey. Mr. Yule made his arrangement with the West Shore Railroad and induced Chas. S. Andrews, the passenger agent for the West Shore route, to travel with the delegation and look after their comfort. As a result Mr. Andrews selected his stopping places and arranged for inviting repasts with ample time for their enjoyment.

A floral horseshoe made of sweet peas, with the letter "P" made of pinks, surrounded by white tuberoses, was sent the delegation with the best wishes of the Henry McShane Mfg. Company, 624 Sixth avenue, New York. In addition they presented each of the travelers with an individual souvenir "Wishing you a safe passage" that met with a merry reception. Mr. Andrews arranged for stopping over at Niagara Falls for a later train and the privilege was accepted by several of the ladies and their escorts.

Hotel Cadillac was reached after a day amid beautiful scenery and a ride for some miles along the lake. After a little delay owing to the demand for rooms all were comfortably quartered and later presented a refreshed appearance in the beautiful dining room of the hotel for tea.

The Knights of Tabasco.

The meeting of the Knights of Tabasco was called to order on Monday night by D. M. Davidson, "Young Pepper," in the absence of Old Pepper T. F. Cushing, who later assumed the chair and made an address on the objects of the association that was to the point and brief, but courteous. The applications of 49 new members were received and the president announced their election with the remark that they would be initiated into the mysteries of the society later.

The following elect are on the anxious bench wondering how "hot" the "stuff" that is to be applied to them will be: Samuel Clark, Thomas J. Douglas, A. C. Cogswell, J. H. Davis, G. F. Hickmott, J. A. Rathbone, C. A. Miller, J. A. Smith, Nicholas Spang, C. J. Johnston, William Palmer, J. E. Zimmerman, G. L. Bottum, C. H. Muchenhirn, M. J. Cohen, P. E. MacDonald, E. D. Babcock, W. H. Hayes, R. M. Dorsey, C. Cushing, D. D. Brick, J. K. Soultz, W. B. Hubbard, John H. D. Rowan, M. J. Brown, Jr., R. Rom, S. E. Little, G. Young, A. M. Buchman, W.

H. Castlen, F. W. Somers, A. E. Hyde, Henry P. Cope, W. H. Morse, J. E. McClain, James F. Meager, H. B. Houghtaling, M. T. Whitney, Chas. A. Crique, F. B. Haywood, J. E. Holland, Fred. Holme, W. Emil Kugeman, R. M. Hooker, G. W. Cope, Frank K. Claw, G. W. Benson, H. B. Auger, M. Sullivan and Augustus Holmes.

On motion the Knights accepted the position in the line assigned them in the master plumbers' parade. On motion all were ordered to carry umbrellas with red ribbon streamers. "Old Pepper" stated that a band had been hired for the occasion and the knights adjourned to meet at 8.30 a.m. Tuesday.

Second Meeting of the Knights.

Word was sent along the line to assemble in the parlor for the initiation at 1.30 p.m., Wednesday, and a full attendance was the result. The Knights passed through the ordeal of initiation in the presence of the other candidates, as it was impossible to handle so large a body, there being 59 new members enrolled up to date.

The candidates were selected, and the initiation would make interesting reading, but it is the only good thing that a salesman has which he does not share generally with his trade, consequently the mystery must be preserved.

On opening the meeting the roll was called. "Young Pepper" then addressed "Old Pepper," and read a communication from the National Association of Master Plumbers, which said that a long session would prevent them from escorting their ladies to excursion steamer to the Ben Hur farm, and requested that the Knights of Tabasco perform that duty for them, which was greeted with cheers. On motion the initiation ceremonies were dispensed with in order to comply with the request.

"Old Pepper" appointed G. W. Young, E. G. Pond, J. E. Zimmerman, D. M. Davids, T. F. Cushing and C. H. Muchenhirn as chairmen to select their own committees and to wait upon the ladies at the Russell, Ste. Claire, Wayne, Normandie, Cadillac and Barclay hotels. The meeting adjourned to meet at the call of the chair to proceed with the initiation ceremonies, and announced that the meeting would be called on the return from the excursion.

Tabasco Refrain.

Who stole my gold watch and chain?
You did.
Who brought it back to me again?
He did.
Who drank all my sparkling wine?
I did.
Who showed the very finest line?
All did.
Who on bard work seemed to thrive?
They did.
Who ever saw men more alive?
I did! You did? No! he did!
Who did? The man who died because he did.

The Ladies.

This year was notable for the attendance of the ladies and the most elaborate floral decorations lost their sweetness and beauty by comparion.

New York was represented by Mrs. Mitchell, Yale, Blace, Cameron, Delacy, Rossman, Pattison, and Miss Byrns.

Chicago by Mrs. Redieske, Breyer, Culloton, Boland, Doyle, Boyd, Sanders, Herbert, Mandable, Conway, Deveney, Cummins, Hickey, Murphy, Wade and Verity.

St. Louis by Mrs. Sheehan, Lonergan, Quinn, Carrol, and Misses Madden and Crim.

Pittsburgh by Mrs. Gray, McCullough, Blythe, Addy, Cowling, McKnight, Bradshaw, and Misses Alice Pitfield, Annie McKenna and Kittie McKenna.

Louisville by Mrs. Duffy, Watts, Ramsey, Matlack, Shulhafer, and Miss Bessie Shulhafer.

Buffalo by Mrs. Stygal, Mensch and Yohl.

Boston, Mrs. Hartnett, Smith.

Lewiston, Maine, Mrs. Smith.

Harrisburg, Pa., Mrs. Kramer.

Saginaw, Mich, Mrs. Merrill.

Brooklyn by Mrs. MacDonald, Lewis, and Miss Lewis.

Naugatuck, Conn., Mrs. Page.

Bridgeport, Conn., Mrs. Green, and Misses Green and Middlebrook.

The Reception Committee of the Detroit ladies, with Mrs. Comstock for president, was composed of the following: Hotel Cadillac, Mrs. Toll, Kramer, Gulney, and Misses Gulney, Crumley, Sheehey, Leunane, Hull, Burton, and Geo. W. Dennis and Melvin Elliott; Russell House, Mrs. Reid and Burton, and Misses Steiner, Walsh and Lee, and Joseph Doyle and David Reid; Hotel St. Claire, Mrs. Walsh and Drury, and Misses Frumvieller, Kramer, Halloran, Hatzenbauler, Giefel and Larkins and Joe E Lee and Harry Wyman; Hotel Normandie, Mrs. Barbier and Bolt, and Misses Meathe, Kramer and Gulney, and James Cameron and Geo. Williams; Hotel Wayne, Mrs. McFadden, and Misses Meathe, Steiner and Cullen, and A. W. Barbier and A. D. Babcock. The Miscellaneous Committee was Mrs. Kenealey, Morris and Sullivan, and Misses McKerchey, Nilla, McKay and Maber.

On Tuesday at 2 p.m. the ladies were taken on a drive to Belle Island and a moonlight ride on the river in the evening. On Wednesday at 4 p.m. to a supper at the "Ben Hur" farm at Walkerville. On Thursday afternoon a carriage ride. Friday 8 a.m., an excursion up the river and a fish dinner at the Oakland House.

Organization.*

BY J. SHEEHAN.

In presenting this paper I beg your indulgence in reiterating our experience as a master plumbers' association, and offering a few suggestions on the subject of "The best plan for the organization of master plumbers' associations and the proper limit of their action," as I know of no better way of making the subject clear than to speak from actual experience. It is a subject requiring much careful thought, inasmuch as it is to be criticized by you, and, if your judgment be favorable, to be referred to the constituent bodies of our national association that have organized and are enjoying the resultant benefits of wise, conservative government, whose opinions and experiences regarding the proper scope of associated effort may differ from ours, and also go before those master plumbers who have not united in inaugurating needed reforms. To the latter this essay is respectfully submitted, and should a review of our experiences and hopes be the means of awakening a consciousness of their responsibility by pointing out lost advantages and gains to be secured through organization, the writer will feel amply rewarded.

OBJECTS OF ORGANIZATION.

The discouraging condition of the plumbing business previous to the inception of our organization actuated us to form ourselves into an association in order to correct existing abuses, maintain our rights as honorable craftsmen, elevate our vocation to a point where from mere struggling mechanics we should be professional sanitarians, and by reason of our ability win the confidence of the public. The motive of the association is to unite upon a comprehensive plan, as many as possible, for a threefold purpose: 1, of obtaining the wisest judgment; 2, the greatest strength, and, 3, the most complete uniformity of action; and in our associated efforts we have been most successful. We have convinced our patrons that we are not the "awful plumber" whom the newspaper scribes take such delight in illustrating and writing about. Our methods are honorable and our bills fair, as they should be for good work, and are only commensurate with our efforts and the time we have spent in perfecting ourselves in the art of protecting the health of the people We have also convinced manufacturers and jobbers of the correlation of our interests, and the journeymen that our interests and theirs are so closely allied that we cannot afford to be inimical in our relations.

MEMBERSHIP.

Who are eligible to membership? At the inception of the association we desired strength in numbers as well as quality of members; but we, the St. Louis Association, have now become strong enough to name the qualifications for membership. Twelve years ago the required qualifications for master plumbers were not necessarily as rigid as to-day, for we have made great advances in sanitation and many new and complicated appliances are now on the market, making it necessary that the progressive master plumber should have a more extended knowledge. In launching our association we found it necessary to open wide the door and extend a pressing invitation to every master plumber to unite with us in elevating and protecting the trade. In so doing we admitted aspirants whose credulity and ignorance led them to believe in the alleged plumber's profits, and that there was no easier road to wealth than by the plumbing business. But, alas! for their mistaken ideas. How they would have fared had it not been for the fostering care of the association they can attest. We realized the existence of poor workmen; that they were in the business with money invested, not much, perhaps, and that the best and only way to eradicate the evil was to educate them by example and contact. That we met with difficulties at the outset is evident, but we have demonstrated its feasibility to a sufficient extent to warrant us in recommending to associations that wish to perfect further the conditions of the business not to be too loud in condemning the practices of their neighboring craftsmen who may, by reason of their lack of favorably located and well stocked stores, gain the ear of the public and elicit sympathy in their favor, but rather educate and encourage them to more honorable methods. Well directed effort in this direction will in time eradicate poor work and do away with the disagreeable and dishonorable competition with cheap labor and poor work, for they generally go hand in hand. The success of this alone will more than pay for the time spent in its interest.

INVITATION TO MASTER PLUMBERS.

Master plumbers' associations are not formed for coercion or monopoly; therefore we should invite all worthy master plumbers to affiliate with us—that is, master plumbers who are conducting a creditable business. As it is the duty of every citizen to support the government which protects his life and property, so it is the duty of every master plumber to support the association that has his interests at heart. If a worthy journeyman plumber desires to start for himself, though he may have been in our employment and by leaving us become our competitor, we should lend him a helping hand. For were we not once journeymen plumbers? Encourage him to strict business methods; teach him to reason that a moderate amount of good work at fair prices is more profitable than much work taken where the stock is furnished at cost and delivered gratis, so that people will see your wagon around town, and labor underestimated and poorly performed in order to get out whole and that a desirable business cannot be built up in this way. This will make competition less harassing.

As to those in business who will not associate with us, rather than attempt to force them into the association or out of business (both being very annoying and generally impossible, and which cause the public to look upon us with suspicion), let us conduct our business and association affairs in such a manner as to make them ashamed of their position, and then the public will look upon them as unwilling to unite in honorable

* Essay presented at the Detroit convention of the National Association of Master Plumbers, June 19-21, 1894.

competition and lend their influence in the furtherance of sanitary legislation for the protection of public health.

SELECTION OF OFFICERS.

The first and all-important factor necessary at the formation to insure the successful working of the association is the selection of cool headed officers—but not so conservative as to be timid in standing up for principle. The officers should be those who are known to the public and to their colleagues as straightforward business men and leaders in the profession, for it is essential that the initial efforts should be espoused and advanced by the best men. It is not always necessary that they should be the old heads, as the saying is, for we have a young element equally well qualified and interested in the welfare of the craft. It is also important that the officers should by their example lead in the good work rather than follow in the rear, as if they were on the battle field; for our position may be likened to a battle field, as we have to combat public opinion, which is naturally hostile to associated effort on the part of workmen or employers, no matter how well directed the effort may be. Wise and dauntless generals command the respect of their followers and the admiration of the foe. After organization and selection of officers it is incumbent upon every member to give the officers their support, for unless they enjoy the confidence of the members, and *vice versa*, but little can be accomplished. It is also necessary that the members be true one to the other—that is, faithful to the rules adopted by the association, which, however, should not be too radical.

An association and its members should not start out with the idea that the conditions which they desire to modify and which have secured a foothold through many years of neglect can be substantially reformed in too short a time, for considerable labor must be devoted to pulling up the rank weeds which have attained unheeded such luxuriant growth.

An association is what the members make it. If the members are unmindful of their own interests and the duty they owe to their brethren and are apparently satisfied with struggling along, making no headway, or being dissatisfied, are unwilling to sacrifice as much to right the wrong as they are to grumble and quarrel, the association will be of little benefit. "United we stand, divided we fall," is a trite maxim which should not be lost sight of.

BENEFITS DERIVED.

To obtain the greatest possible benefit from organization you must enter into it with due regard for the rights of others; with a determination to be honorable in all your dealings; a willingness to sacrifice a little, if necessary, to maintain the principles of the organization. To do this your dealings must be of a nature to inspire confidence, for if it were not for the confidence existing in the business world, business would be paralyzed.

Cast aside petty jealousies. It is said that plumbers are suspiciously jealous of one another. This was true before organization and exists now to a certain extent. We read in one of our trade papers a beautiful illustration of the brotherly feeling existing between master plumbers today. In one of our Eastern cities a time-honored member was about to take his leave for a short visit to his native land, across the Atlantic, and his association tendered him a complimentary dinner on the eve of his departure, speaking words of love, wishing him *bon voyage* and safe return. Who ever heard of plumbers banqueting a brother plumber 12 years ago? If an association accomplished nothing more than to create such a friendly feeling it has done much. It is the true foundation and secret of success.

Members sometimes become lukewarm in attending meetings; sometimes because everything is going along nicely and nothing comes up to oppose them. If you do not attend, what assurance have you that some scheme is not being concocted which may be contrary to the best interests of the trade? Others become lukewarm because the association or some individual does not think exactly as they do. But did you ever stop to think that your association might be in the right and you in the wrong? Oh, no! Submit gracefully to the majority when the majority is right, which it is quite apt to be.

HOW TO INCREASE INTEREST.

To increase interest arrange for discussions on themes of interest to the trade. The association should be the means of disseminating valuable information relative to the best methods of doing work; proper sanitary laws. Information that Mr. Deadbeat, not many miles away, owes you for work performed last spring and that he needs to be watched, would be the means of saving considerable work and trouble, all for nothing. A good way to bring members out is to entice them with a light lunch and a smoke. A moderate collation is inexpensive and money well spent, for which each member may have an opportunity to receive his full share if he will only avail himself of the chance. Such meetings have not only a resulting monetary value, but a social value which should not be lost sight of when summing up the good of your association.

The object of joining so many members in one common purpose is to give power that could never result from the spasmodic action of individuals acting separately. This power should be utilized along the line of harmonizing relations and formulating desirable agreements with manufacturers and dealers in supplies relative to selling outside of the trade; promoting better relations with journeymen, and securing proper sanitary laws in the interest of public health.

METHODS OF BUSINESS.

That the master plumbers are justly entitled to the profits accruing from the material used is too well established to require comment. The dealers throughout the country, almost without exception, recognize that it is just to the plumber and beneficial to their interests as jobbers to deal exclusively with the trade. Did this idea of justice and protection originate with individuals acting unitedly? Hardly. It was through organization, without which all efforts would be futile. The jobbers, recognizing the justice of our position, also recognize that where no association exists the plumbers are apparently satisfied with existing conditions and act accordingly. If you are not satisfied, it only remains for you to do as we have done—organize and receive the most complete protection of any association in the country.

Do not presume that you can secure protection gratuitously; it ought not to be asked, and much less expected, that supply houses will protect you in the sale of goods unless you can offer some inducement in return, rather than compulsion. I regret that it is the prevailing custom among some master plumbers to substitute one manufacturer's goods for another's. I now refer to manufacturers who protect us. You figure on a job where a certain line of goods are called for, and, perhaps, secure the contract. You are a little partial to a certain manufacturer for various reasons. He may have befriended you some time and it is natural for you to do him a good turn, and which is very honorable if you can speak in behalf of his goods before any are specified; but after you have contracted to put in another manufacturer's goods and then go to the owner and say: "Smith's closets and tubs are very good, but Jones' are equally as good. I have used a great many of his goods and they have always given entire satisfaction, as I am sure they will in your case, and I will give you a good job. You see, I have been dealing with Jones for a number of years and of course I feel partial to his goods, not that they are any better, simply because he is an old friend of mine," perhaps the owner has not much preference and he consents. How would you feel toward a certain manufacturer who would say to a customer of yours who had called to see some goods: "Oh, yes! Barnes is your plumber—he is a fine fellow and a good workman, but did you get an estimate from Thompson? He lives up your way, too. He is an old schoolmate of mine. I had him do a little work for me last fall; his price was reasonable and his work very good, and they say he is doing a fine business." There is not much said, but considerable implied. Your customer may step in to see Thompson, whose prices are about the same, so he gives him the job. I do not wonder that manufacturers are sometimes out of patience on account of the uncalled-for treatment they receive. As master plumbers, we should do unto others as we would wish others to do unto us. Therefore, when a manufacturer who is protecting our interests and has influenced an owner or architect to use or specify his goods, it is as much your duty to put them in and keep still about your favorite manufacturer as it is for the manufacturer to show your customer his specialties and not speak of some other plumber.

MUTUAL PROTECTION.

As we are working for mutual protection we should be actuated by a spirit of fairness and generosity toward our neighbors. We should refuse, without the consent of the first plumber, to finish any work commenced by another plumber when he has been compelled to stop work from causes not his own fault, such as non-payment of installments as the work progresses or unreasonable demands on the part of the architects. An adherence to this rule will enable us better to assert our rights and secure prompt payment of money due us. When an owner, builder or architect presents a bill for work performed by another plumber, we should never question his prices, for you do not know the circumstances under which the plumber had to work. As a guide to members, a schedule of prices—fair, but not exorbitant—should be adopted. It will eradicate a discrepancy in prices and tend to restore the confidence of the public; for when one man goes to his plumber and then to another and finds the prices are about the same, he concludes that neither is outrageously large, as one sometimes appears to be under present existing conditions. We have found this method most satisfactory, not only to our members but to the public as well.

Master plumbers should not only be working plumbers, but merchant plumbers, and should stoutly refuse to use any material they do not furnish, and *vice versa*. A strict adherence to this system will tend to a better enforcement of the Baltimore resolutions and will create a better feeling between manufacturers and master plumbers.

It has been demonstrated by strikes and lockouts that one class of individuals cannot override or control another, and that better relations can be maintained and more peaceful settlement of disputes consummated by a conference between the parties interested than by refusing to amicably discuss and adjust grievances in question. We have found that a conference committee with our journeymen has been very beneficial. Hours of work and wages are arranged for a year in advance and other matters of importance to both parties have been adjusted. We have not reached perfection along this line, but our success warrants us in recommending conference committees between masters and journeymen.

In many localities it is optional as to how plumbing work shall be executed, and it is needless to say that in such places unsanitary work and disease prevail. Not alone is this injurious to the health of the community, but it renders it difficult for master plumbers who know how and have a desire to do good work to compete with the impractical plumber, who has but little regard for sanitation and whose chief aim is to make the most money out of the job

We believe, with New York and Massachusetts, that complete protection against this condition of affairs can only be obtained through legislation, and in that direction we are exerting our influence and trust that our efforts will be crowned with success.

Organization of Master Plumbers' Associations and the Proper Limit of Their Actions.*

BY S. E. DIBBLE.

Experience has shown that organization, as distinguished from individualism, is generally necessary to promote great interests. So long as organized bodies strive to only promote their interest in a legitimate way, do not trample on the rights of their individual members, or antagonize the welfare of the public, they will, as a rule, meet with the most hearty co-operation of all with whom they are concerned, provided their aims be proper ones; and such an aim, I believe to be the advancing of sanitary laws, the study of sanitary subjects and the promotion of sanitary interests generally. Therefore I say that master plumbers' associations, coming within the scope of this premise, are desirable and ought to be successful.

QUESTION OF ORGANIZATION.

There is no subject that is brought so near home to all of us master plumbers as this question of organization. Many essays have

*Essay presented at the Detroit Convention of the National Association of Master Plumbers, June 19-21, 1894.

been written on various topics, but none of more importance than this one. Organization is the material on which we have builded, and out of the strength which this union has developed has come a success greater than it was possible for the most sanguine and far sighted of us to expect.

The National Association, the State and the numerous local associations have not only of themselves been beneficial, but to the individual members has come the added benefit which has made them stronger, nobler and broader.

Of course pages might be written about associations existing only in name, of associations established but killed by intemperate enthusiasm, and of associations ruptured by discord, but the fact would still remain that the growth, strength and success of those that survive have come from organization.

The founders of these associations did not expect that formation was all that was necessary, but that formation having taken place, united action on the part of members should follow, and that aims having one common end should be pursued. With this in view, all practical master plumbers ought to associate together wherever feasible. Confidence in each other should above all be the aim and ambition of every member; next to promote and maintain and advance the principles of sanitary science through deliberations and harmonious action. Nothing should mar the proceedings of any meetings and all things should tend toward the elevation of the individual members. Each should impart to the others the knowledge he obtains in the prosecution of his trade, banish all selfish purposes and seek to promote the good of his fellow members in the organization, as well as his fellow men out of it.

DISSEMINATION OF KNOWLEDGE.

Men of advanced ideas are always found in every organized body. They lose nothing by imparting at the proper time and in the proper place the knowledge they have acquired or the ideas which they possess, be they theoretical or practical. Those men will still remain leaders, and they have nothing to fear from dividing their knowledge and ideas with others. Men will always be found who cannot put in practice what they know full well in theory, and to the practical man should be imparted that knowledge lest all be lost. With the desire on the part of the individual members to impart their knowledge comes the production and perfecting of many important devices whose application in a practical way is of manifold uses

Such action has often been and will be many times again the means of placing before the world many sanitary appliances adapted to the better protection of homes and families. Such results are bound to come from the united action of many and clearly show wherein our associations may be beneficial. All this, I am aware, calls for the sacrifice of self for the benefit of others. A very pretty sentiment, some of you may think, and yet it is much more than that, for by it comes much of the progress and advancement in the world.

Nor should a man confine himself to the limits of his organization. He should look at it from without if he would know how to make the most of it. He should see how others outside of it regard it; how it is received by them and what are its effects upon them. He should be able to detect its defects and remedy them, and these may be far more easily detected by looking at them from without than by viewing them always from within.

SUCCESSFUL ORGANIZATION.

Successful organization requires in the organizers a somewhat unusual combination of qualities, among which may be mentioned a knowledge of men and their ways, the faculty of looking ahead and seeing into things, and the faculty of clearly understanding and clearly presenting exactly the objects desired. While experience is useful, I do not think it is essential, and it is astonishing how soon a shrewd and careful man will make a success of his undertaking, even though his experience be limited. Perseverance against many disheartening conditions is a sure requisite.

It is a well-known fact that a piece of timber is no stronger than it is at its weakest point: that is, the point by which its ability to do its work must be measured. This general law holds good in all works and may be applied to all combinations of persons, and is certainly true of associations like ours. There must be union, there must be interest, there must be persistent effort on the part of each and every member to make the whole successful.

As to the proper limit of the actions of such associations, I should say, in a general way, that anything that tends to promote the welfare and the interest of the members without injury to any is proper and right. Among the first objects to be attained comes the education of the young men who have selected our particular trade for their life work, and upon whose efforts so much of the life and health of our people will in the future depend. This is an advancing age, and progress in sanitary science as well as in other branches of science is sure to be made. Our organizations should be educators. This may be brought about by debate, by discussion, by papers carefully prepared. I care not whether it be done by the larger or smaller associations, by the city or the country, all if properly done is sure to have an elevating and beneficial effect upon our young men.

In cities and towns where boards of health exist, the members of our associations should join with them in wise and useful legislation. Co-operation on the passage of laws and care in the exercise of those laws after they have been enacted should be the duty of us all. Such action would certainly result in promoting the healthfulness and cleanliness of our respective municipalities.

Within the proper limits of our action comes also co-operation with the manufacturers and dealers with whom we are in contact. Organization giving to all its members equal facilities cannot but be profitable to us and to all those requiring the benefit of our labors.

Practically no association is limited in its action so long as it directs its doings toward that which is honorable, and for the good of all; its work is never ended.

TRAPS AND VENTS.

H. C. BURNETT and R. M. BALDWIN have formed a partnership in a plumbing and gas and steam heating business at Bluefield, W. Va.

FRANK C. HOCK will open a plumbing and electrical wiring establishment in the Drake Block, Goshen, N. Y.

DENNIS SWEENY and W. B. BLOTTMAN will open a plumbing establishment at Greenville, Ohio.

MILLER & BISHOP, Scottdale, Pa., have added a plumbing department to their business.

OLDS & WHIPPLE of Hartford, Conn., have added sanitary plumbing to their already large steam and hot water heating busioes They have secured the services of B. O. Tilden of Boston to look after thia department.

SECRETARY CASE of the Water Board, Detroit, Mich., sent out notices last week to the 90 plumbers who had obtained licenses from him, saying that they should be examined by the Plumbing Board of the Board of Health before July 1, and get certificates from the latter. Quite a number have been examined by the Plumbing Board and half a dozen were unable to pass the necessary examination. These will be unable to work as master plumbers after July 1. At that date and thereafter every master plumber must show a certificate from the Board of Health.

The British Board of Trade returns for the month of May do not, says the *Economist*, give much encouragement to the theory that the trade of Great Britain is reviving, since there is a falling off on both sides of the account as compared with the corresponding month of last year. In imports the shrinkage amounted to $12,980,000, the falling off being most marked in textile materials. Exports were $1,622,400 less than in May last year.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

THE CONTRACT for putting in the heating and ventilating apparatus at the Vermillion, S. D., University has been let to the B. F. Sturtevant Company of Chicago at $4400.

W. E. PAUL, Portsmouth, N. H., secured the contract for supplying the steam heating apparatus for the Saco Hotel, Saco, Maine.

THE CONTRACT for ventilating the Knapp School, Somerville, Mass., was awarded Braman, Dow & Co. of Boston, amount of bid being $1600.

THE CONTRACT for plumbing work on the city building and in the Fifth Ward engine house, New Castle, Pa., was let to W. B. Bagnall.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until July 6 for the steam heating and ventilating apparatus for the United States Post Office at Houghton, Maine. Drawings and specifications may be obtained from the Supervising Architect at Washington or from the superintendent at Houghton, Maine.

THE ARNOLD COMPANY have taken the contract for the hot water heating in W. R. Demarest's new house on Sherman avenue, New Haven, Conn. The same company have the steam heating of John Reichel's new house in Fair Haven, Conn.

ARCHITECT WM H. ALLEN has given the contract for the plumbing work in the new Seamen's Bethel, on Water street, New Haven, Conn., to the New Haven Heating & Plumbing Company. T. W. Corbett of New Haven has been awarded the heating contract.

WALKER & CAREY, East Main street, Waterbury, Conn., have taken the contract for the plumbing and tinning of the Connecticut World's Fair Building at West Haven, Conn.

SEALED PROPOSALS will be received by the president of the Board of Trustees, Milledgeville, Ga., until July 10 for work including the steam heating, plumbing, &c., in a new asylum building.

AT A RECENT MEETING of the Board of Supervisors it was decided to heat the court house at Champaign, Ill., jail and sheriff's residence by steam.

R. H. WALKER, Elmira, N. Y., was awarded the contract for heating the County Court House at Watkins for $2857.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until June 27 for labor and materials and fixing in place complete eight new hot water boilers in the United States Custom House and Post Office Building at St. Louis, Mo. Drawings and specifications may be obtained from the Supervising Architect, Washington, or from the superintendent at St. Louis.

CASWELL & MOORE, Phœnixville, Pa., have received the contract for the tinning and plumbing of a new block of houses to be erected by Mrs. Gillardon on Washington avenue in that town.

KEHM BROS. & MERTZ, 289 East Kinzie street, Chicago, are to install a hot water heating plant in the residence of

A. Von Tesmar, 233 Orchard street, and a steam heating plant in the McPherson School, Wolcott street, near Lawrence avenue, Ravenswood.

FLASHINGS.

Disley & Weyand, Waterbury, Conn., have a contract for the metal work on the new Methodist church in Derby, Conn.

The American Roofing Company, Cincinnati and St. Louis, report the shipment of something over 16 carloads iron and steel roofing to various points in the State of Texas during the month of May, while orders from various sections continue to come in very satisfactorily.

The Cambridge Roofing Company of Cambridge, Ohio, have recently purchased and now have in operation a modern outfit for the manufacture of galvanized eave trough and conductor pipe. Both are made in sections 10 feet long, without cross seam, and the large orders which have already been booked would indicate that their product in this line is fully up to standard, as is also their line of metal roofing and siding.

The Metal Stamping & Spinning Company of Grand Rapids, Mich., have issued a fine catalogue of their specialties for the season of 1894-95. It comprises 80 broad pages of illustrations of architectural ornaments and statuary, which are made by the company in sheet zinc, copper, brass and aluminum. These comprise capitals in numerous rich and original designs, rosettes, leaves, garlands and wreaths, points and drops, heads and faces, shells, angles and mansard leaves, panel ornaments and scrolls, enrichments for moldings and friezes, panel scrolls, gable ornaments, steel ceilings, creatings, finials, chimney tops, metal shingles, stamped sign figures and letters, rock face siding, bracket and modillion rolls, balls, &c. The company also manufacture copper, brass and tin ware. A feature of this catalogue is that prices are given in each case in immediate connection with the article. Another feature, still more noteworthy, is that the designs shown are largely original.

The Globe Iron Roofing & Corrugating Company, Cincinnati, with rolling mills at Newport, Ky., state that they did more business in roofing material during the month of May just past by at least 25 per cent. than the same period in 1893, the latter having been the banner month in the history of their business career. While orders are still continuing very satisfactorily, during a brief interval they were compelled to run both rolling mills and corrugating establishment night and day. They also congratulate themselves on the fact that since January 1 this year their mills have never been shut down or idle in any single department for any reason whatever, no breakages or repairs of any kind having been found necessary.

"What the People Say" is the title of a pretty pamphlet brought out by the Metallic Roofing Company of Canada, Limited, Toronto and Montreal, Canada. It is a book of general testimonials relating to their shingles, which include the Eastlake, Empire and Thorn's patent steel shingles. The first mentioned is illustrated as a frontispiece to the pamphlet. Attention is likewise directed to Hayes' patent steel lathing. The other shingles are shown at the back of the volume, together with tiles, rock faced steel siding, &c. The testimonials come from all parts of the Dominion and fill about 50 pages.

J. Foerster & Son of 806 East Fifth street, New York, have recently completed the copper work and slate roofing on the church at the corner of Oliver and Devoe streets, and the copper cornice, finials, ventilators, towers, skylights and slate roofing, including the galvanized iron ventilating pipe work, on the school house in Herkimer street near Ralph avenue, Brooklyn. The special feature of this job is that no iron whatever is used in connection with the copper work, the copper roofing being fastened with copper nails, while the gutter braces are of brass and the hinged leader fastener of copper nailed to the walls with ¼ x 3 copper nails. The lightning rod is also of copper fastened to the walls with brass staples made expressly for the purpose. The rivets are of copper and the bolts brass. Foerster & Son have also completed many other smaller contracts.

Shackleton Brothers have recently taken possession of new quarters at 171-175 Prospect street, Cleveland, Ohio, where with increased equipments, additional floor room and good light they are prepared to supply first-class work at low prices. They make a specialty of slate roofing, Hayes' skylights, steel ceiling (Kinnear's patent) and sheet metal work for buildings and other purposes. The slate yard of the firm is located on Cedar avenue in the city named.

The American Roofing Company, St. Louis and Cincinnati, report an excellent demand for corrugated iron. Some months since they added a new branch to their business, that of making gutters, eaves trough, conductor pipes, hangers, &c. This department has steadily grown and now requires a great deal of their attention. Their gutter catalogue, containing everything they make in this line, is being sent to the trade on application.

Recent Treasury Decisions.

Drawback on Tin Handles, Nozzle Bodies, and Caps Attached to Tin Cans.

On high tin handles made from imported IC tin plate, and on low screw tin nozzle bodies, and flat tin caps made from imported taggers tin, attached to 5 gallon tin cans manufactured and exported by the Standard Oil Company of New York, Sone & Fleming Works, a drawback will be allowed equal in amount to the duties paid on the quantities of imported materials used in the manufacture of such articles, less the legal deduction of 1 per cent.

The quantities so used may be determined by allowing 40 pounds of IC tin plate for each 1000 high tin handles, 10 pounds of taggers tin plate for each 1000 low screw tin nozzles, and 7 pounds of taggers tin plate for each 1000 flat tin caps.

Drawback on Steel Clock Spring Material.

On the exportation of steel clock spring material, rolled, tempered, polished and prepared for cutting into lengths suitable for clock springs, manufactured by R. H. Wolff & Co., Limited, of New York City, from imported steel wire rods, a drawback will be allowed equal in amount to the duty paid on the rods used in the manufacture, less the legal deduction of 1 per cent.

The quantity of imported rods so used shall be determined by adding to the net weight of the exported article, as certified by a United States weigher, 16 per cent. of such weight.

The drawback entry must specify the size of the clock spring steel material and the gross and net weight of each package to be exported, and the manufacturers' declaration on the entry must show that the article was manufactured in accordance with their sworn statement dated August 9, 1893.

Drawback on 1 and 2 Gallon "Round" Tin Oil Cans.

On the exportation of 1-gallon and 2-gallon "round" tin cans manufactured by the Standard Oil Company of New York at the Devoe Works a drawback will be allowed equal in amount to the duty paid on the quantities of imported pig tin and pig lead used in soldering such cans, less the legal deduction of 1 per cent.

The quantities of such tin and lead which may be taken as the basis for allowance of drawback shall be for 1-gallon cans 64 per cent., and for 2-gallon cans 73 per cent. of the allowance provided in the instructions of January 26, 1894 (Synopsis 14,592), for 5-gallon rectangular cans, subject to the special provisions and limitations of said instructions.

Hunting Knives—Certain Pocket Lock Knives Not.

Before the U. S. General Appraisers at New York, March 5, 1894. In the matter of the protests, 58,281 *a*-13,927, &c., of A. Kastor & Bro., *et al.*, against the decision of the Collector of Customs at New York as to the rate and amount of duties chargeable on certain pocket knives or lock knives imported per the vessels and at the dates named in the annexed schedule Opinion by Wilkinson, General Appraiser.

The goods are knives with horn or bone handles. Each has one large and one small blade; some of them have corkscrews, picks, &c., in the back, and all of them have lock springs to keep the large blade fixed when open, the knife being shut by pressure upon the small blade. The merchandise was assessed for duty under the provisions of paragraph 165, N. T., for pocket knives, and is claimed to be dutiable under the provisions of paragraph 167 for hunting knives. Paragraph 165 provides for "pocket knives of all kinds."

We find that the knives in question are designed to be carried in the pocket; that they are so commonly carried, and that they are in fact pocket knives.

The protests are overruled accordingly.

A peculiar feature of the transatlantic passenger traffic at the present time is that the larger tide of steerage travel is flowing eastward rather than westward, as is generally the case at this season. Outgoing steamers from New York are sailing with crowded steerages, while immigration is not up to the average. This is attributed to the existing business depression and comparative scarcity of employment in this country.

W. A. Stanton, secretary and treasurer of the Fayette Manufacturing Company, manufacturers of silica brick and magnesia, sailed on the "Campania" last week. He goes to the Continent to transact some business there.

At a fire in Dubuque, Iowa, last week, 22,000,000 feet of lumber were burnt up.

STEAM AND HOT WATER.

Convention of Master Fitters.

The Master Steam and Hot Water Fitters' Association of the United States began its sixth annual convention in a hall of the Broadway Central Hotel, New York, June 19.

TUESDAY MORNING.

The first session of the convention began at 11.20 o'clock President Rutzler in the chair. The roll call and reading of minutes having been dispensed with, by motion the president then appointed the following Credential Committee:

A. E. Kenrick, Boston.
E. D. Smith, New York.
C. H. Simmons, Chicago.
W. P. Thompson, Philadelphia.

After the appointment of the committee a recess was taken till 2 p.m.

TUESDAY AFTERNOON.

At 2.30 the delegates assembled, and the first order of business was the presentation of the president's address by Mr. Rutzler, extracts from which are given below:

President's Address.

I congratulate you on this, our sixth annual convention, that, after the financial and general commercial strain and universal lack of business covering the whole of the United States for the past year, there are enough of us left to make so fine a showing at this meeting. The position of the officers of the association for 1893-94 can perhaps be justly compared to that of men in the divers lines of business in our country, which is summed up in a few words of but little to do and an insufficiency of funds to do that little with.

Perhaps it is fortunate for me that my term of presidency should have fallen at a time when there has been so few demands upon us. To have accomplished so little in an ordinary year would be embarrassing indeed, but under the depressed circumstances through which our country has passed I am confident that you, as fair minded men, could not have expected very much. . . .

You are all familiar with the action taken at our last annual meeting in the matter of standard flanges, adopted as reported by our committee. Manufacturers have since suggested a few changes. This question was brought to the attention of the Executive Committee and myself, further mention of which will be made in the secretary's report.

Our Committee on Standard Flanges is still in existence. In my opinion this question should be referred to them again, that they may specially consider the changes recommended, perhaps in conjunction with a committee of manufacturers, or at least such manufacturers as are present or have representatives here. I am convinced that standard flanges is a long stride in the right direction in our interest and that of our patrons, and of the manufacturers as well. The ground of all these desirable features was so thoroughly covered in the discussion at our last convention that it is not necessary for me to bring them to your attention at this time any further than to say that letters received in answer to the pamphlets issued embodying the action showed a hearty approval on the part of the manufacturers.

It would be well, however, that we consider at this meeting what the percentage of inquiry by steam fitters has been for standard flanges, and how far they are endeavoring to use them in their work. You will remember that so far as was practicable we were to use in our business nothing but standard flanges after January 1 of the present year. One manufacturer, to my knowledge, has already made the necessary changes and is ready to supply the standards adopted. How extensively this has been done, or how many firms are thus equipped, is more than I have been advised of.

I am led to say that I never so fully realized the respect in which this association is held by the supply trade as I have since holding the position of president. I had always underrated our worth as an organization before, and I believe every member to-day who has not held office in it is undervaluing our strength. I think there are few, if any, manufacturers who are unwilling to extend to us what is our due. It is my opinion, too, that on account of the want of a full realization of how others look upon us, and with the uncertain value we place upon the organization ourselves, results are minimized and our effectiveness seriously impaired.

We have spent four years now, and I might say five, in trying to induce men who do a small amount of heating in connection with some other business to identify themselves with us and have our assistance in removing obstacles that are in their way. The question arises with me now, is it not better that we band together, as we should in the larger cities, and say we are going to take care of this association, leaving it with these outside parties to come with us if they want to, meeting them nine-tenths of the way when they offer to come, and do them all the good we can, but not hunt for them any more? Our lowest rate is $10 per year; it is barely possible that it might be made $5, but I do not believe if it were these men would do more than talk. They would rather keep that $5 than come into the association, and by some healthy method in the localities where they are doing business benefit themselves to the amount of $500. The National office has been filled with letters for the past two or three years wherein men state they cannot put a price upon their work because the consumer can get goods first hand.

I say this is purely the fault of men in localities where such transactions take place. I do not think they could do very much by themselves, but if they will join together and become members of this organization we can benefit them and stop such conditions. I know of one small city where all the letters we have had this year have been encouraging—not one complaint. They pay their dues promptly, and are acting in a fair and honest way toward each other. They originally simply sent out letters to the supply trade stating that they belonged to the national association, and I am confident they have had nothing to complain of in the way of violations. Their secretary writes that although they have not done one-third the work they did the year before, their profits have been greater.

There is another subject that I wish to call your attention to, and that is the contracting for work and guaranteeing a temperature of 70° Fahrenheit in zero weather. I think a committee should be appointed to recommend a remedy for this complication. . .

I call this matter to your attention believing that steps should be taken at once that will prevent any further encroachment upon our rights in this direction. We must not forget that we are nearly always the last contractors to complete our work, and if the party from whom we have taken our contract should run short of funds after he has paid all others, we have to wait until he gets good and ready to settle, with the possibility of losing the final payment or a portion of it entirely. We should not allow our anxiety to close a contract to lead us into accepting conditions that in many instances result in a loss on the work performed. Such contingencies can only be avoided through regulations and agreements among ourselves, through our local and national associations. The grievance cited here is one that I think our whole country is afflicted with, and therefore the special necessity of national action upon it.

For the honor which you conferred upon me at our last convention by electing me to the office of president I wish to earnestly thank you, and to attest that the duties have been pleasant as well as beneficial to me as a member.

At the close of the address, which was received with applause, Mr. Hudson moved that it be referred to the Executive Committee and the recommendations contained in it be reported upon Wednesday morning.

Before the presentation of the secretary's report, President Rutzler introduced David M. Nesbit of the London firm of Ashwell & Nesbit, heating and ventilating engineers, who later was to read a paper before the association. Mr. Nesbit spoke of the gratification it gave him to receive so warm a welcome. He referred to the excellent work he had seen in heating plants in New York and intimated that heating engineering was further advanced in this country than in England. Mr. Nesbit closed with a cordial invitation to any or all of the members to visit him should they ever go to England. Following this pleasant little episode Secretary Reynolds read

his report, of which we print part below:

Secretary's Report.

For the sixth time in the history of this association I place before you a review of a year's work, with a comment or two added.

As usual, the first few weeks were consumed in moving, installing ourselves in new headquarters and sending forth matter mapped out by the annual meeting. A mimeograph copy of the resolution of the Committee on Manufacturers and Jobbers was distributed very soon after our arrival in New York, as directed by the convention. This resolution you will remember reads as follows: "Your committee respectfully recommend that manufacturers and jobbers be requested not to sell goods to the consumer except to those who are already exempted by our former national consumers' discount sheet."

Pamphlets containing recommendation of the Committee on Standardization of Flanges and the action of the convention in the matter were printed at the earliest possible moment and placed in the hands of all steam fitters and manufacturers throughout the United States.

The letters called forth by this pamphlet were numerous, and were unanimous in the sentiment that the step was an important and well considered one from all points of view.

Some of the manufacturers were of the opinion that several of the dismeters recommended could be improved upon, and at the request of a few of them a call was issued for an executive committee meeting, and President Rutzler invited Carlton W. Nason, chairman of the Committee of Mechanical Engineers on standardization, to be present. A protracted session resulted, and it was the conclusion that the committee had better abide by the decision of the annual meeting, especially as the scale of standards had been placed in the hands of those concerned, leaving it with the manufacturers to come together and change such sizes as they deemed best. The matter was not again referred to until December, when we received a call from E. P. Bates, chairman of your Committee on Standardization. He stated that he had been requested to recommend the following alterations: "That the 3½ and 4 inch flanges be changed from four bolts to eight, the bolt holes being made ¼ inch in dismeter instead of ⅝."

The advisability of the committee's acting upon this was considered at length, and it was decided that they were not at liberty to do so, and thus the subject rests. . . .

LOCALS.

Reports from the various locals all through the year have not been very encoursging, but this is not surprising, taking into consideration the state of business generally and the limited amount of building undertaken in many localities.

TRAVELS.

As to my travels this year and my efforts to form new locals, I have very little comment to make. I have undertaken several short trips, but they have not been productive of much good, at least the results are not yet visible. There has been but little to warrant venturing the expense of traveling and seeking to increase our strength since our last annual meeting.

I was advised by one of our members that firms in New Haven, Conn., were anxious to come into the fold and do something for themselves. Upon this information I made a visit there, but could not succeed in getting them together at that time. I planned with one of the firms to arrange a meeting at a later day and advise me. This he undertook to do, but the report from him was that he did not meet with any success.

Two trips to Paterson, N. J, showed about the same results.

William P. Thompson of Philadelphia has been earnestly working the whole year to revive the local in that city and recently has been holding meetings with some promise of success. Mr. Thompson will be here to report what encouragement he has met with.

I have made four trips to Philadelphia since the headquarters have been in New York City, and I can assure you they are in something the same condition there that the city of Boston was in at the time of my first visit. All I can say is, if they were thoroughly organized with a view to making the situation as bad as possible it could not be any worse than it is.

On April 5 I started on a journey west. I first went to Cincinnati, where I think I accomplished some good; at least, we have recently received very favorable reports from there, which we hope will be verified at this meeting. From there I went to Chicago, where I found contracting employers of labor in all lines in a siege with their men, and there was no prospect of diverting the minds of our people from that issue. It is indeed a sorry day for organizations when Chicago men, with their experience, need any urging in association affairs.

Prior to leaving New York I had written St. Paul and Milwaukee inquiring if I could do any good by going there, and requesting them to reply to me at Chicago. Their answers were that they would be glad to see me, but they did not think I could be of any benefit. The one from St. Paul indicated that nothing could be done for them at the present time.

This is attributable largely to the financial condition of the country, there being really no prospect of work except perhaps to a limited extent. The letters from Milwaukee set forth that their local was in good condition, with an increased membership, but had not a very flattering prospect of business, and they urged for lower dues, &c., which they have since reduced.

From Chicago I went to St. Louis, where the men for a long term of years have failed to accomplish very much toward sustaining each other or their business as a whole. I could not remain there longer than two days, and I think from reports since my return that I did them some permanent good.

From St. Louis I visited Cleveland, where I found a grievance that was slightly unique. I will explain this in private conversation only. I did what I could during my short stay there to convince those I saw that the division existing between them was destructive in the extreme. We have late information that they have reorganized on somewhat new lines and that they will be represented at this meeting. Certainly this is encouraging, and we hope they will be here to speak for themselves. . . .

DISCOUNT SHEET.

Referring to the resolution passed at our last convention recommending that manufacturers and jobbers be requested not to sell goods to the consumer except to those who were already exempted by our former national discount sheet, it is proper to report that so far as my observation has gone this resolution has not had the slightest consideration from either the sellers of goods or our members. The measure of disrespect it has received from all directions is sufficient to teach that no possible good can accrue to your association from this policy or any other wherein the manufacturer or jobber is expected not to sell to the consumer. The only thing that has been of any avail in that line was the original discount sheet, which it is undoubtedly safe now to again reinstate, but on slightly different lines.

The storm created by the circular relative to it (that was issued in 1892) has now blown over, and experience has taught that it would have been wiser to couch it in milder language; and had this been done, beyond a doubt there would have been no sharp criticism upon it. The fault of the wording of the circular you can attribute to me. I am not willing, however, that you should charge I am not ready to learn from experience.

Personally I am of the opinion, based upon close observation, that much more can be accomplished through appealing to the sellers of goods than by demanding. No firm in the United States can successfully cover up a method of selling to the consumer at trade prices. It will get into the atmosphere in spite of them, and they cannot escape the odium that will positively follow, provided you maintain your organization and keep any recorded data of this character.

HOT WATER BOILERS.

We have had some letters relative to the hot water boiler plague during the year, and in addition to this I have held conversations from time to time with a few in that line with reference to the disagreeable features in connection with the present practice. I have endeavored to induce one very competent gentleman who has had a large experience in handling boilers with the trade to write an article upon the subject. I hoped at one time he would do so, but later on he informed me he was too busy. I am inclined to think it is a question he felt more like giving up than attempting to recommend a remedy for, feeling possibly that he could not do the situation full justice. I do not believe anybody could. While a few have punished themselves sufficiently by losing money on taking contracts a large number seem still to continue in the business.

I saw a reference a short time ago to the importance of a man being protected against himself. I think there is a good field among the hot water boiler people for some enthusiast to do a great mission work in this direction that could be classed as a blessing pure and simple.

AMALGAMATION.

The question of amalgamation of the two associations of master steam fitters and master plumbers, which has been discussed pro and con, and of which President Hudson spoke very decisively in his report last year, has been decided for the present at least. . . .

CONCLUSION.

It is painful, indeed, to be called upon to announce to you so long a list of losses by death of valuable and worthy members in our organization since our last meeting: Herman A. Kroeschell of Chicago, Hazen Mooers of Milwaukee, I. Lincoln, Jr., of Chicago, George Strong, president of the

Joliet local, and William Costello of South Boston, Mass.

In conclusion, in grateful appreciation of the support of our president and Executive Committee and of many faithful and energetic members in the work for you, I wish to express my most earnest thanks, and to add that the future success and dignity of your commercial affairs depends largely upon lines mapped out at this meeting. I say this, believing that no convention you have yet held can be classed with it in importance. Recognizing how easy and natural it is to err causes me to look upon the results of your present gathering with much concern. In proportion as you study and prepare in the interest of the whole will you best serve yourself individually. No single person's interest to the detriment of the mass of you should receive one moment's consideration. This last remark particularly includes your present secretary.

Hoping that the best possible action in your behalf will prevail, I again thank you, one and all.

At the close of the secretary's report P. S. Hudson was called upon to read a communication from the ruler of these parts presenting the keys of the city. It was a humorous production involving the most extraordinary sequence of misapplied epithets and double meaning words.

The treasurer, E. D. Smith, then reported receipts of $8843.90, and disbursements of $8626.36, leaving a balance of $217.54.

J. L. Wells next read the report of the Executive Committee, from which we quote as follows:

Executive Committee's Report.

The reports of our president and secretary having covered all congratulatory features leave us no duties to perform in that direction any further than to say we welcome and are indeed glad to meet you, and we are with you, of you, and for you.

The chief work at this convention is to endeavor to anticipate what the conditions before us are likely to be, and to plan wisely enough to meet them in the most substantial and far reaching manner, remembering always that we are ever nearest success when we are adhering to the lines of consistency and justice.

This sentiment should be carried particularly into our local relations with each other, as well as our national. New lines, new men, new ideas and developments of every description are constantly being introduced. Those who are attempting to do their business to-day, locally or nationally, upon the conditions that existed two, five, or ten years ago, will learn later to their sorrow that they have not fully kept abreast of the unceasing march of progress they are ever forced to come in contact with.

While it might have been comparatively safe ten years ago to presume upon a continuance of given patronage, it will not do to build upon any such expectations to day, when younger men are inheriting seats at the commanding desk, bringing to it new conditions, new associates and new friends made in other channels and at other clubs. No single firm can stand now and successfully say, "We are the people." Where it was once mostly multiplication and addition it is now nearly all division and subtraction. We must not forget that the school house of the present is preparing well equipped contract seekers more rapidly and in greater numbers than in the past. Added to this, they have the advantage, through the numerous trade schools in different sections, of becoming practical and trained experts in a time brief compared to the old methods of developing men. Hence the necessity of those in the business now following lines that are least likely to leave their profits with those for whom the work is done. There is nothing rational in conducting our business at cost prices this year with a view to advertising, trusting that by such means we shall insure an increase of patronage later on to which we may add fair profits. . . .

In answering the questions many times asked in regard to the value of our organization, and what it has accomplished, it is to be regretted that the sum total of what the association has prevented in the way of disaster coming upon our trade cannot be pointed out, and it becomes doubly lamentable when we remember that it is a condition none realize or appreciate, even in a fractional part. . . .

It is perhaps due you that we refer to our lack of membership in cities with less than 75,000 inhabitants. There is no doubt but that the firm stand taken by steam fitters in our large cities reflects a benefit to the lesser ones referred to, and there is no question either but that the disorganized condition in the smaller cities reflects detrimentally to the larger ones. It is certain that if steam fitters in these cities would take steps to benefit themselves through organization and become members of the national, the result universally would be of great benefit.

The query arises, why do they decline to do this? We have a few men in cities of less than 50,000 inhabitants who have benefited themselves wonderfully, and they are a substantial aid to our organization. If there could be a general, spontaneous uprising of such a character in all these cities the good returns would be beyond any man's power to foretell. They can have a membership with us at the rate of $10 per year, and the amount it would cost them to maintain their local would be merely nominal. Can it be possible they think it is profitable to them to save these small amounts? Surely they could not prove that it is by those who have tried it in an earnest and substantial manner.

This has been a problem of much concern to every former executive committee, as well as the present one. There has been much thought and work devoted to inducing such parties to join with us and thus rectify many irrational things that exist among us. It has been impossible thus far to move them, and it is beyond our power at the present time to point out a remedy, but we do hope that at this convention some one will be able to make suggestions which will prove profitable in this direction, or else, as our president suggests, we should look after our own affairs and cease further urging in this direction. The national association up to date has been almost wholly supported by the larger cities, and possibly we shall be forced in the future to rely entirely upon these sections for maintenance without endeavoring to do any particular good outside their limits, for surely it is discouraging to be forever pleading in vain.

Relative to the house heating boiler question, as slightly touched upon by the secretary in his report, we think this feature should be again gone over at this meeting. Possibly some one may have a recommendation to make. We suggest that a committee be appointed to consider the matter. Some of the boilermen who have had a wide experience in installing work claim to have abandoned that practice. We suppose it is fair to assume that others will, through the same experience, later on do likewise, but we must admit that it is slightly aggravating to have to wait for these people to gather in this very costly knowledge.

It would not be so provoking if the losses and injury all fell upon themselves, but that is not the case. It reflects on all of us, and their patrons as well. It forces us in many instances if we take contracts to leave our profits with our customers, while on the other hand we are injured by the imperfect work put in from time to time after it is learned that the contracts have been taken at figures that are sure to cause a loss of money; for surely when they do that they are by a necessity forced to furnish as little as possible and put that little in in as cheap a manner as they can conceive of and have the whole pass inspection and get their pay. This injures steam and water heating the country over, for the reason that it causes many to hesitate about using either in small plants. . . .

Committees.

After the reading of this report the president appointed the following committees:

Standard Flanges.

E. P. Bates.
A. C. Walworth.
S. J. Geohegan.

Permanent Headquarters.

E. P. Bates.
A. B. Franklin.
Geo. A. Jackson.

Constitution and By-Laws.

A. B. Franklin.
Wm. P. Thompson.
E. P. Bates.
John Davis.
A. C. Walworth.

Appeals and Grievances.

C. H. Simmons.
A. E. Kenrick.
F. A. Williams.
Geo. H. Morris.

Good of Order.

Wm. P. Thompson.
Jno. W. Danforth.
Wm. E. Bartlett.
J. F. Buerkel.
A. B. Franklin.
P. H. Hudson.

Credential Committee.

A. E. Kenrick.
E. D. Smith.
C. H. Simmons.
Wm. P. Thompson.

Reinstatement of Discount Sheet.

James Curran.
C. H. Simmons.
John B. Hughes.
A. C. Walworth.
P. H. Kendricken.
E. D. Smith.
John Davis.

House Heating Boiler Question.

John W. Mills.
H. J. Barron.
Geo. H. Morris.
John W. Danforth.
Chas. B. Kruse.

Ways and Means, Including Publication of Souvenir.

Wm. P. Thompson.
E. P. Bates.
J. L. Wells.
Geo. A. Suter.
John B. Hughes.
Jno. F. Buerkel.
A. B. Franklin.
W. K. Downey.
John Danforth.
C. H. Simmons.
Alfred Gawthrop.

Guaranteeing Temperature.

E. P. Bates.
Jas. Curran.
John Danforth.
A. E. Kenrick.
Geo. A. Suter.
F. K. Van Court.
S. J. Geohegan.
W. K. Downey.

Resolutions of Sympathy, etc.

A. B. Franklin.
John Whittet.
William S. Phillips.

The session adjourned at 4.30 to meet Wednesday morning at 10 o'clock.

WEDNESDAY MORNING.

Owing to the time occupied in the preparation of the reports of the standing committees the convention did not assemble until 11.30 o'clock. Several committees were called upon for reports, but as they were not ready the first business taken up was a communication from the Massachusetts association on the subject of reorganizing the National Association. The communication was referred to the Committee on Constitution and By-laws. The Committee on Credentials then reported the following delegates present:

List of Delegates.

BUFFALO.

John W. Danforth.
Jos. L Whittet, Whittet, Barrett & Co.
Jos. L. Whittet, proxy for Brand & Ceiger.
Jos. L. Whittet, proxy for W. A. Case & Son.
Jos. L. Whittet, proxy for Clark & Co
Jos. L. Whittet, proxy for J. H. Ruckel & Co.

CHICAGO.

C. H. Simmons, Theo. Jacobs Company.
John Davis, John Davis Company.
P. S. Hudson, Baker & Smith Company.
P. S. Hudson, proxy for Chicago Heating Company.
P. S. Hudson, proxy for Kroeschell Bros.
P. S. Hudson, proxy for John Woodman.
P. S. Hudson, proxy for W. D. O'Brien.
P. S. Hudson, proxy for Geo. C. Mickow & Co.
P. S. Hudson, proxy for Illinois Heating Company.
P. S. Hudson, proxy for F. W. Lamb & Co.
P. S. Hudson, proxy for M. J. Cragin.
D. M. Quay, Wills & Newton Company.
John W. Mills, L. H. Prentice Company.

MILWAUKEE.

Charles B. Kruse, Chas. B. Kruse Heating Company.
Charles B. Kruse, proxy for Davies & Lohman.
Charles B. Kruse, proxy for Cordes & Tries.
W. K. Downey, H. Moores & Co.
W. K. Downey, proxy for M. Coogan & Co.
W. K. Downey, proxy for A. J. Lindeman & Hoverson Company.
W. K. Downey, proxy for Grassler & Gezelschap.

NEW YORK.

E. Rutzler.
E. D. Smith, Baker & Smith Company.
J. L. Wells, Wells & Newton.
S. J. Geoghegan, Gillis & Geoghegan.
F. W. Williams, Blake & Williams.
James Curran, Jas. Curran Mfg. Company.
Andrew Mercer, H. B. Smith Company.
William S. Phillips, Phillips, Doup & Co.
Geo. H. Morris, Johnson & Morris.
Fred. K. Van Court, Bonner & Van Court.
Jno. Neal's Sons.
Peter Backus, of Peter Backus & Son.

MASSACHUSETTS.

P. H. Kendricken, Ingalls & Kendricken.
P. H. Kendricken, proxy for Walker, Pratt & Co.
A. C. Walworth, Walworth Construction Company.
J. F. Buerkel, J. F. Buerkel & Co.
A. E. Kenrick, Kenrick Bros.
Wm. E. Bartlett.
Nutter & Seabury.
John C. Honeyman, Thayer Heater Company.
Daniel Russell.
Wm. Smallman, Isaac Coffin & Co.
John B. Farnsworth.
A. B. Franklin.
A. B. Franklin, proxy for G. M. Parks.
Lawrence E. Milleay.
E. W. Fiske, Smith & Anthony Company, Boston.
H. W. Heath.

PROVIDENCE.

Geo. A. Jenks, Union Steam & Gas Pipe Company.
Henry F. Root, H. F. Root & Sons.
F. Coggshall.
Don J. Husey, proxy for Capital Heater Company.
E. R. Bryant, Pawtucket Steam & Gas Pipe Company.
J. M. Smith, H. B. Smith Company.

PHILADELPHIA.

W. P. Thompson, Thompson Bros.
W. P Thompson, proxy for Reeves & West.
John C. F. Traeschel.

ST. LOUIS.

John B Hughes, Hughes & Stone.
John B. Hughes, proxy for Globe Steam Heating Company.
John B. Hughes, proxy for Doherty Bros.
John B. Hughes, proxy for Missouri Steam Heating Company.

Isolated Members.

Alfred Gawthrop, Alfred Gawthrop & Bro. Company, Wilmington, Del.
John C. Brison, Brison Plumbing & Heating Company, Wilmington, Del.
John Collis, Des Moines, Iowa.
Peter Forve & Bro., Wilkes-Barre, Pa.
H. A. R. Dietrick, South Bethlehem, Pa.
C. Y. Beach, Bridgeport Steam Heating Company, Bridgeport, Conn.
E. P. Bates, Syracuse, N. Y.

After the report of the Credential Committee was received the following resolution, presented by Jno. W. Mills, was adopted:

Whereas, We learn with pleasure that the annual convention of the National Association of Master Plumbers, now in session at Detroit, is a success both in attendance and enthusiasm: therefore

Resolved, That we wire our congratulations and hopes that both our associations will be successful in receiving that protection which we both need to insure our success.

In accordance with this resolution the following telegram was sent:

We send congratulations on your successful meeting and hope each association will secure complete trade protection.

At this point in the proceedings A. S. Purdy of Toronto, Canada, was introduced to the meeting and spoke on the subject of extending the organization to Canada. The matter was referred to the Committee of Ways and Means.

After it had been decided to devote the afternoon session to the reading of papers a communication was read from H. Brill, general manager of the New York Trade School, inviting the delegates to visit the school while in the city. On motion of A. B. Franklin it was decided to accept the invitation and visit the school early Thursday morning.

L. D. Sherman, who represented the manufacturers, was introduced and asked if the convention would be free for the entertainment provided for Thursday afternoon and evening. He also invited the delegates to an entertainment for Wednesday evening. Adjournment was then taken at 12.30 o'clock till the afternoon.

WEDNESDAY AFTERNOON.

The delegates assembled at 2.30 o'clock and the proceedings were begun by receiving the report of the Committee on Revision of Discounts, which was submitted by Mr. Curran without reading, the meeting deciding to postpone the discussion.

As provided for at the morning session, the next order of business was the reading of papers. The first presented was on "English Practice in Heating and Ventilation," by David M. Nesbit of London. Mr. Nesbit illustrated his paper with diagrams on the walls of the convention hall, which added to the interest of the essay.

The second paper, on "The Difference in Amount of Radiation Required in Buildings of Good and Poor Construction," by E. P. Bates, was listened to with much interest. The paper is printed in full elsewhere. The third paper of the afternoon was entitled "Types of Heating Boilers in the United States" and was read by A. C.

Walworth. At the close of this paper it was decided to defer the further reading of papers, and on motion of Mr. Kenrick the meeting went into executive session to consider the reports of the committees of Ways and Means and Revision of the Constitution. The meeting adjourned late in the afternoon to meet again Thursday morning.

THURSDAY MORNING.

The convention was called to order at 10.30 o'clock and the proceedings opened by a paper, "How to Benefit the Trade," read by D. M. Quay of Chicago.

The president read a congratulatory dispatch received from the secretary of the National Association of Master Plumbers, in convention at Detroit, in answer to a similar dispatch forwarded to them by this association.

Next in order was a letter received from Chas. Barnett, representative of the National Association of Steam and Hot Water Fitters and Helpers of America, inclosing, for the indorsement of this convention, a copy of the engineers' bill, presented at their last national session, held in Cleveland.

The bill was as follows :

SECTION 1. No manufacturer or employer in this commonwealth having in their employ a person or persons whose duties are the care and operation of stationary (steam) engines or steam boilers, or both, shall exact from said employees any other work than the care of such engines and boilers.

SEC. 2. No person or persons whose occupation is the care and operation of steam engines and boilers, shall, while in performance of that duty, perform any other work that will occasion them leaving their engine or boiler room.

SEC. 3. Any manufacturer, corporation, or person violating any of the provisions of this act, shall be punished by a fine of not less than $50 for each offense.

After discussion the bill was, on motion of D. M. Quay, referred to the incoming committee.

A motion was then made and carried, that the president appoint a committee composed of past members of the Executive Committee to make nominations for officers in the association; and the president having named such committee, another motion was carried to empower the Nominating Committee to make a recommendation as to the time and place for holding the next convention.

A. C. Walworth moved that the new Executive Committee consider the question of expediting the business of the next convention by having the papers printed and distributed prior to the opening of the convention. Mr. Kendricken moved in amendment that the time to be occupied in the reading of a paper be restricted to ten minutes. The amendment being accepted by Mr. Walworth, the motion was carried.

E. P. Bates of Syracuse, in reporting for the Committee on Standard Flanges, produced a flange made on the standard adopted by the last convention, provided by Jenkins Bros. With the aid of a valve he explained the features of the standard flange, the main feature being the drilling of the bolt holes equi distant from a line on the center of the valve stem. He also read a table of comparisons between the dimensions of standard flanges and ordinary flanges.

Mr. Walworth expressed himself strongly in favor of the standard flange.

Mr. Kendricken suggested that prints be published to show the fitter just what advantages he would get in the standard flange.

J. L. Wells of New York then moved that the association adhere to the standard for flanges adopted last year.

G. T. Coppins of the Walworth Mfg. Company expressed the desire of his company to meet the requirements of the standard flange in any reasonable way, but referring to the table of comparisons, he pointed out certain modifications which could be made so as to utilize certain patterns of ordinary flanges without detriment to the general principles of the standard flange, so far as thickness and diameter of material were concerned. A. C. Walworth then moved that the question of modification of sizes of standard flanges where they conflicted with manufacturers' sizes be referred back to the committee, with power to act in the matter.

The two motions being put to a vote, Mr. Walworth's motion was carried and Mr. Wells' motion rejected. The session then adjourned in order that all present might avail themselves of the invitation by the manufacturers to an excursion to Glen Island. It was arranged to hold the next session of the convention at 9 o'clock on Friday morning.

FRIDAY MORNING.

The convention was called to order at 10 a.m. The first business was the report of the Committee on Permanent Headquarters by E. P. Bates, chairman. The committee recommended that the headquarters should be in the city of New York.

J. L. Wells, as chairman of the Executive Committee, recommended that a committee of three be appointed by the president to draft a form of contract with special reference to the guarantee regarding zero weather, and that they report at the next convention.

Mr. Kendricken was of opinion that action should be taken at once and that a report be made in 90 days.

On motion, Mr. Kendricken's suggestion was added to Mr. Wells' recommendation and adopted.

The president called on a number of committees to report, but each report, together with other matters that came up for discussion, was held over for action in executive session. At 11 a.m. the meeting went into executive session.

The committee appointed for the purpose reported the following nominations for officers for the ensuing year, who were unanimously elected :

OFFICERS.

President, H. D. Crane, Cincinnati.
Vice-president, E. P. Bates, Syracuse.
Treasurer, E. D. Smith, New York.

EXECUTIVE COMMITTEE.

J. L. Wells, New York.
A. C. Walworth, Boston.
W. P. Thompson, Philadelphia.
John W. Danforth, Buffalo.
F. A. Williams, New York.

STATE VICE PRESIDENTS.

Illinois, J. W. Mills, Chicago.
New York, Jas. Curran, New York.
Ohio, —— Chafer, Cleveland.
New Hampshire, E. H. Randall, Concord.
Rhode Island, Jas. M. Smith, Providence.
Missouri, J. B. Hughes, St. Louis.
Delaware, A. Gawthorp, Wilmington.
Minnesota, Wm Rodgers, St. Paul.
Michigan, Chas. W. Light, Saginaw.
Colorado, C. J. Reilly, Denver.
Washington, J. H. Griffith, Spokane.
Iowa, H. T. Ahrens, Davenport.
Wisconsin, Wm. K. Downey, Milwaukee.
Sergeant-at Arms, H. A. R. Dietrich, South Bethlehem, Pa.

The committee recommended that the Executive Committee be authorized to fill vacancies by appointment whether such occurs by the loss of a vice president or because the convention has not elected a vice-president for any State, and also to fill vacancies in the committee.

It was decided that the next place of meeting would be St. Louis, but in case arrangements could not be made for holding the convention there it would be held in Cincinnati. The session adjourned at 1.30 p.m. to meet again an hour later.

Odd Items.

THE EXCITEMENT incident to the setting up of exhibits resulted in a laugh against a prominent exhibitor. Failing to find a suitable foundation for the tacks with which he was fastening his show card to the wall, he doffed his coat before renewing his efforts to secure a "tack hold." A neighboring boilerman came along and found it necessary to doff his coat also, and the only available place for depositing it being the spot selected by the P. E., the new comer's coat was laid upon the first. After the P. E. had adjusted his card he donned the boilerman's coat, and though its length was not exactly in proportion to his figure, he did not notice the change and wended his way upstairs. The boilerman having finished his labors, of course had no alternative but to accept the change, which proved all the more acceptable as a pocket contained a goodly roll of the "stuff" with which supplymen provide themselves before attending conventions. It was possibly the need of this material which led to a speedy and satisfactory exchange and explanation.

IF ANY ONE failed to get one of the Smith & Winchester souvenirs it was through no fault of Newland E. Frost, their popular secretary. The souvenir was a donkey's head made of paper, on the balloon principle, with an air hole for inflating it. When

inflated, the head was supposed to represent the fitters' idea of a man who put in a furnace instead of a steam or hot water apparatus. Deflation of the head produced a wailing sound.

THE AMERICAN RADIATOR COMPANY'S parlors were well patronized throughout the convention and seemed to be the center of attraction for the lady visitors. Flowers in profusion perfumed the atmosphere of the rooms and there was a plentiful supply of flowers at all times at the disposal of the visitors, who were received by the representatives of the company.

THE HOLLAND RADIATOR COMPANY made a fine display of various styles of their radiators.

ONE of the most useful souvenirs of the convention was the fountain pen distributed by the American Boiler Company. Instead of the company's imprint on the outside of the pen, why not have had the "yell" of their enthusiastic representatives engraved on it? Here is the yell:

Who are we? Who are we?
The American Boiler Com-pau-ee!
With a hip-o. With a hip-o,
With a hip-o, hip-o he.
It's just as plain as plain can be,
The company that leads is the A. B. C.
With a hip o. With a hip-o,
With a hip-o, hip o he.

THE CRANE COMPANY of Chicago issued a 24-page pamphlet compiled especially for the convention and descriptive of their different establishments. The pamphlet contained many illustrations and was handsome in appearance.

THE HERENDEEN MFG. COMPANY, Geneva, N. Y., were represented by F. W. Herendeen, who took the opportunity afforded by the convention to further extend the company's trade connections. Besides furnishing fans for the comfort of those attending the sessions, the company distributed some handsome leather card cases which were much appreciated.

EDWARD F. KEATING, New York, had a goodly exhibit in comfortable parlors on the third floor. Brown's patent steam traps, Hoey & Conrow exhaust condensers, Hilt's chain pipe wrenches, Trim's pipe wrenches, Marsh's Acme air, steam and water valves were specialties prominent in the exhibit. Mr. Keating was in charge and had for assistants Jos. Keating, Thos. Lang, J. Irlbecher and Wm. Smith.

THE THAYER HEATER COMPANY of Boston had a fine exhibit of Thayer hot water heaters. The heaters presented an attractive appearance, being tastefully painted and decorated. John C. Hanneman represented the company and expounded the merits of the heaters, and the valuable features of the water top or auxiliary dome which formed part of the heaters. In use this top takes the place of the plain top and is connected with the supply and return pipes of the heaters and having a free circulation independent of the boilers it receives the full benefit of the products of combustion, as they are claimed to pass entirely over its exposed surface before reaching the indirect draft.

THE J. H. MCLAIN COMPANY of Canton, Ohio, were well represented among the exhibitors, having a fine exhibit, consisting of a No. 427 Cambridge steam heater and Harvard, Humber, Yale and Sandow hot water heaters. The Harvard and Humber were similar in construction, the Harvard, being intended for cellar use, having an additional jacket. The points in the Cambridge steam heater attracting most attention were the cone shaped water sections and the flared and corrugated fire pot. The peculiar shape of the water sections, it was stated, made the heater absolutely self-cleaning. Another point made was that the sections are all bolted together in milled joints on the outside of the heater, consequently no leakage could arise owing to the expansion and contraction of the fastening bolts. The heater burns either hard or soft coal.

THE DEANE STEAM PUMP COMPANY of Holyoke, Mass., exhibited a line of their steam pumps, consisting of a No. 2 boiler feed, in section; a 6 x 4 x 6 duplex, a 4½ x 2¾ x 4 pump and automatic receiver, and a 2 x 6 triplex electric power pump—a new pump which can be run from shafting or directly from a motor. The exhibit was in charge of John Mullan, W. S. Young and E. S. Denise.

THE IDEAL BOILER COMPANY of Chicago showed a No. 24 Ideal hot water heater, and Geo. E. Downe, the company's president and H. E. Jones, the New England representative, enumerated the good qualities of the heater and drew attention to its deep corrugated fire pot having a true taper, to its unobstructed waterways and its positive and quick circulation. A leading point was that when it was required to increase the capacity of the heater additional sections could be added.

THE FOSKETT & BISHOP COMPANY of New Haven, Conn., exhibited on the main floor a small model of the G. & J. R. Bolton heaters.

J. P. DUGGER, secretary of the Keewanee Boiler Company, Chicago and Kewanee, was in attendance, and looked after the interests of his company.

WHEN BONNIE THORNTON, at the entertainment at the Madison Square Roof Garden, said: "All you steam and hot water fitters throw your money on the stage for the Sick Babies' Fund," who threw one of the Chinese coins forming part of the Ideal Boiler Company's Souvenir?

THE RICHMOND STOVE COMPANY, Norwich, Conn., were snugly ensconced in Parlor 334. They had no exhibit, preferring to take advantage of the display of Richmond steam and hot water heaters to be found at 85 Centre street, the house of their New York agents, A. A. Cryer & Co. Callers were received by B. E. Mallory, Norman Whitelaw, Frank Whitelaw, Geo. W. Clark and Chas. F. Hanss, who also extolled the merits of Richmond steam and hot water heaters and made presentations of elegant souvenirs in the shape of Peacock cigar ash receivers and a combined paper weight and match box bearing the form of a turtle.

THE JOHN SIMMONS COMPANY, 110 Centre street, New York, dealers in pipe and fittings and general supplies, distributed souvenir glass pens, neatly put up in wooden cases, which were very acceptable to all fortunate enough to secure them.

"IT'S SWEET to be remembered," remarked E. N. Squires, the popular secretary and manager of the New York Central Iron Works Company, Geneva, N. Y., manufacturers of the well-known Dunning boiler, as he presented to every one with whom he came in contact a small bottle of Lundborg's perfume, bearing a label embodying the compliments of his company. He also distributed a neat little leather *portemonnaie* bearing the company's card and the motto: "Good 'cents' and dollars buy the Dunning boilers."

HART & CROUSE of Utica, N. Y., were among the leading firms without exhibits, but their exhibitions at previous conventions and their reputation insured them many visitors to their parlor. W. M. Mackay, David Miller and H. L. Anderson showed an aluminum model of the Royal heater and dispensed "royal" cigars, the two forming a happy combination, as it is whispered that second calls were made. Mackay's quick opening hot water valve was on view and its utility discussed.

THE CRANE COMPANY of Chicago, Philadelphia and New York, utilized Parlor 212 for the entertainment of all who accepted their cordial invitation to call and see them. G. Frank Uhler and Waldron Moore, the company's New York representatives, were most assiduous in their attentions and extended the reputation enjoyed by the company.

THE UNITED STATES HEATER COMPANY of Detroit had no exhibit, but Second Vice-President J. W. Mills and Eastern Representative J. L. Saunders were at home in a third-floor parlor and extolled the virtues of the Capitol hot water, Hecla steam and Mascot steam and hot water heaters. "Forty sizes of boilers with forty different sized grades" was one of the impressions carried away by visitors. Another was a neat little match safe of vulcanized rubber, the appreciation of which was shown by its service throughout the convention.

Exhibits.

THE GURNEY HEATER MFG. COMPANY of Boston had a very large exhibit in the basement in charge of Vice-President John A. Fish, assisted by J. G. Forrest, Charles Morrison, J. G. James, W. T. Isaac and James P. Shoop, all popular salesmen of the company. The exhibit comprises a No. 305 Gurney heater, a Gurney double crown hot water heater and a No. 4 and No. 5 Gurney steam boiler, the latest production of the company and recently described in *The Metal Worker;* Gurney radiators and the Yale, a new radiator just brought out by the company. The latter attracted much attention. Mr. Fish described it as the largest radiator loop occupying the smallest space ever introduced, and very valuable where it was necessary to put much in little space.

* * *

JENKINS BROS. of New York, Boston, Chicago and Philadelphia occupied two rooms on the parlor floor, where A. B. Jenkins with J. D. Stiles, H. G. Logan and Mr. Utz entertained callers. Their only exhibit was a line of valves with the standard flanges adopted by the American Society of Mechanical Engineers and the Master Steam and Hot Water Fitters' Association. This was the first public appearance of valves having the standard flanges, and the firm are to be complimented upon their enterprise. They have a full line of patterns and are able to furnish any size called for.

* * *

THE NASON MFG. COMPANY, 71 Beekman street, New York, were exhibitors of their new Nason shaking grate. Chas. Yingling represented the company and explained the principles of the grate and its ability to thoroughly shake a fire, stir the ashes and break clinkers or cinders and pass them through to the ash pan.

* * *

RAYMOND & CAMPBELL MFG. COMPANY.

Conspicuous on account of its polished Russia iron jacket and dainty white trimmings was the Sun boiler, exhibited in the basement by the Raymond & Campbell Mfg. Company of Middletown, Pa. At the head of the stairs leading to the basement was displayed a large card bearing the legend, "The Sun lights the way—take a few rays." The "rays," suspended in rows, were *facsimile* testimonials received from users of the boiler, each testimonial on a separate sheet of convenient size. The stand was in charge of Harry H. Lindemuth, the inventor of the boiler, and Alex B. Johnston, the manager of the New York office of the company, who practically explained how "the Sun do move."

* * *

POWERS DUPLEX REGULATOR COMPANY.

P. MacCallum represented the Powers Duplex Regulator Company and showed the company's regulator as applied to hot water and hot air heaters and hot water tanks. He also showed their device for operating dampers or valves in flues of indirect hot air systems, both with furnace and forced draft, as used in schools, colleges, churches and hospitals.

* * *

THE A. J. BENNETT PATENT RADIATOR ATTACHMENT COMPANY

were represented by A. J. Bennett, who exhibited their Comfort foot rest for direct radiation and their new foot bracket for indirect and furnace heat. The Bundy radiators in the room were used to show the devices to advantage, and the comfort suggested by them was appreciated by all who saw them. The foot rests are made of malleable iron, neatly bronzed or nickel plated, and have upholstered plush rolls or heel supports. They are furnished with couplings to suit any style of radiator on

the market. Catalogues describing the devices were in demand and a plentiful supply afforded.

* * *

THE EATON, COLE & BURNHAM COMPANY

of New York were located in the basement and showed a line of globe, gate and radiator valves and a general line of steam and hot water fittings and fitters' tools. Prominent in their exhibit were a 14-inch by-pass gate valve, guaranteed to stand 500 pounds steam pressure, for use in power houses and places where extremely high pressure is required; a 4-inch pipe machine, and a 2 inch Gem nozzle for fire purposes. The stand was in charge of Geo. E. Walton and Nelson Mervin, the Eastern salesman.

* * *

TIMOTHY KIELEY,

7 to 11 West Eighteenth street, New York, was on the main floor near the office with a line of steam heating specialties covering the Champion return steam trap, high pressure regulator, oil separator, Standard trap, Eureka pressure regulator and positive acting pump governor.

* * *

THE FULLER & WARREN COMPANY

of Troy, N. Y., occupied a prominent position in the basement, where they showed their No. 26 double section self cleaning hot water boiler and their No. 15 hot water boiler, the latter largely used by engine companies as superheaters. They also showed the hot water section used in their combination warm air and hot water furnaces. The arrangement of this section is quite simple. The water entering the boiler is compelled to pass entirely around and over the top of the fire before reaching the cross section, through which it flows and is connected with the next section, in which the same surface is traversed. The flow continues until it reaches the top, where it is distributed by the flow pipe to the different radiators, from whence it is returned to the bottom of the boiler and again circulated. One or more sections may be used according to the requirements, and any section may be tapped to accommodate from a 2-inch to a 3-inch flow pipe. The bottom section is of horseshoe shape tapped for two 2-inch pipes. The exhibit was in charge of R. S. Wood, the secretary and general manager of the company, and J. J. Wilson, the company's heating engineer.

* * *

THE SMITH & WINCHESTER COMPANY

of Boston showed their No. 12 Winchester boiler, lately placed on the market. It is a sectional cast iron boiler with screwed joints, and embodying a large amount of heating surface over and around the fire. It has an anti-clinker rocking and dumping grate and nickel plated trimmings, and is tapped for return in both sides and rear, in order that returns may be easily run no matter in what position the boiler is placed. The diaphragm of the damper regulator is connected by a special fitting to insure cold water contact with the rubber. The stand was in charge of Newland E. Frost, the secretary of the company.

* * *

THE MODEL HEATING COMPANY

of Philadelphia were exhibitors of the only boiler in practical operation. This was their new No. 235 Novelty steam generator. In front of the boiler was a pyrometer attached to a rod passing over the fire, recording the temperature of the combustion chamber. A thermometer at the smoke outlet showed the temperature of the products of combustion when passing out of the boiler. This was to demonstrate the efficiency of the fire surface. A section of the boiler showing the fire surface was also exhibited. A. C. Edgar and M. B. Moore represented the company and intelligently explained the features of the exhibit.

* * *

THE PACIFIC MFG. COMPANY

of 471-473 Eighteenth street, Brooklyn, had a stand on the main floor near the office, where they exhibited the Nelson valves. W. G. Nelson and G. F. Batt were in charge, and explained the working of the compensating disks in the valves. As this was the first appearance of the valves on the market they naturally attracted a good deal of attention. A feature of the exhibit was a valve made of aluminum, and intended for a traveler's sample.

* * *

A. A. GRIFFING IRON COMPANY.

At No. 201, on the parlor floor, a pair of parlors accommodated the A. A. Griffing Iron Company of Jersey City, N. J.; the Powers Duplex Regulator Company, 36 Dearborn street, Chicago, and the A. J. Bennett Patent Radiator Attachment Company, Woonsocket, R. I. The A. A. Griffing Iron Company showed a line of their Bundy radiators and radiator fittings. They also showed a new pipe hanger having a side hinge which, it is claimed, allows of the strength of the hanger to center where the weight of the pipe is located, and a quick opening hot water radiator valve. The interests of the company were looked after by Thomas H. Williams, president, assisted by L. B. Sherman, C. F. Lathrop, John Sabin, John De Barthe, Leonard Elliott, T. Mason and Frank Somers.

* * *

THE SMITH & ANTHONY COMPANY

of Boston, Mass., occupied the coolest place in the basement with their Hub boilers. They exhibited a No. 20 hot water boiler, and No. 118 steam boiler in sections. S. F. Terwilliger and E. W. Fiske, the assistant secretary of the company, were in charge and drew attention to the overhanging fire pot, which brings the water immediately over the fire and concentrates the heat under the crown sheet section. The inclination of the water from the start, it was explained, is upward and from center to sides, and back to center, circulating through every section.

* * *

THE WALWORTH MFG. COMPANY

of Boston had a well arranged and extensive exhibit in parlor No. 330. It consisted of steam and hot water valves for fire purposes, sprinklers, pipe tools, stocks and dies, Stilson wrenches and all kinds of steam and hot water fittings. As novelties they showed a new combination union elbow and valve; the F. P. ball cock, which, it is stated, is absolutely noiseless and will in any size take a 4-inch ball; and the Ashley patent nipple holder. G. T. Coppins, the secretary of the company; E. P. Keen and W. P. F. Ayer were in attendance.

* * *

THE KENNEDY VALVE MFG. COMPANY,

52 Cliff street, New York, made a very nice showing with a line of their extra heavy gate valves, brass and iron globe and angle valves, radiator valves, straightway and quick opening valves. The exhibit was in charge of President D. Kennedy, P. Hartenfells and E. F. Koons.

* * *

THE SPRINGFIELD COIL BOILER COMPANY.

An exhibit attracting a good deal of attention was that of the Springfield Coil Boiler Company of Springfield, Mass. It consisted of a model of large size showing the construction of the boiler. O. D. Adams, the president of the company, and J. Leon Guyon, the New York agent, imparted information regarding the boiler and explained that the hot water enters the lower coils, passes around the fire box into a supply standard which distributes it into the upper coils, whence it passes into column and thence into the steam drum, through the pipes and back to the boiler. The grate is novel, having a reverse action to destroy coning in the center, a common source of annoyance.

* * *

THE BOYNTON FURNACE COMPANY

of New York and Chicago had the largest exhibit in the convention. It consisted of a No. 23 hot water boiler for hard coal, a No. 207 hot water boiler for soft coal, a No. 506 and a No. 608 steam boiler, a No. 48 hot water boiler for hard coal, all of the Boynton line, and three Niagara boilers. An idea as to the ease with which these boilers are set up may be gathered when it is stated that they arrived in parts and were set up completely by three men in 11 hours. The interests of the company were ably looked after by A. B. Marshall, C. F. Armitage and Jos. Smith.

* * *

THE WM. H. PAGE BOILER COMPANY,

Norwich, Conn., were represented by G. H. Weymouth, who exhibited a No. 1 and No. 8 hot water and No. 8 steam boiler of their Volunteer line. Particular attention was bestowed on the No. 1 boiler, it having their automatic regulator attached. The regulator consisted of a cast iron drum extending from the top of the boiler to the hottest part of the water without coming in contact with the fire. The drum is filled with water independent of the water in the system, the water by expansion operating a rubber diaphragm. The boilers were without ornamentation of any kind and just as shipped from the factory.

* * *

THE THATCHER FURNACE COMPANY

of 240 Water street, New York, and Newark, N. J., showed their No. 4 Champion steam heater, the size suitable for 300 feet of direct radiation. It is a horizontal tubular boiler in connection with a cast iron sectional fire box. An advantage in its construction is claimed to be the large combustion chamber for expansion of the gases, allowing them to become thoroughly ignited before going to the heating surface. The heat passes from the combustion chamber through the tubes, and by baffle plates is made to pass over the shell of the boiler before reaching the smoke pipe. The boiler is easy to clean, the tubes being reached from the front door, and it may be cleaned when under fire. Any kind of fuel may be used. The boiler was shown and its principle explained by G. H. Hersey.

* * *

BLAKE & WILLIAMS,

186 and 188 South Fifth avenue, New York, dealers in steam and water heating and ventilating apparatus, were located in a suit of rooms on the third floor, and exhibited Blake's hot water thermostat and a line of Blake's patent malleable iron adjustable pipe hangers. John L. McMaun, the firm's heating engineer, and Matthew Duff proved to be able representatives of the firm and received many callers.

The Entertainers.

The entertainment of the delegates was, as usual, taken in hand by the representatives of the manufacturers assembled at the hotel. On the morning of the first day of the convention the meeting was called to order by R. D. Reed, after which Major E. R. Pierce was elected chairman and L. H. Hart secretary. The principal business before the meeting was the appointment of committees on entertainment and finances. The following is the committee appointed by the chair on entertainment:

L. D. Sherman, A. A. Griffing Iron Company.
R. D. Reed, H. B. Smith Company.
J. D. Stiles, Jenkins Brothers.

The Finance Committee was composed of

A. F. Gartz, Crane Company.
F. A. Herendeen, Herendeen Mfg. Company.
Scott Coppin, Walworth Mfg. Company.
George Downe, Ideal Boiler Company.
William H. Hill, American Radiator Company.
C. A. Lathrop, A. A. Griffing Iron Company.
D. Paul Hughes, Standard Radiator Company.

Entertainments.

On Wednesday evening the delegates and their ladies attended a concert in the Roof Garden at the Madison Square Garden, at the invitation of the manufacturers, where an excellent programme was provided.

On Thursday the delegates and their friends, as the guests of the manufacturers, enjoyed a delightful excursion to Glen Island. The party, numbering 250, left the hotel shortly after 1 p.m. in omnibuses placed at their disposal, and boarded the steamer "Laura M. Starin," and accompanied by a band of music proceeded to the island, which was reached after a pleasant sail up the Sound, extending over two hours. Some little time was spent in the enjoyment of the attractions of the island, and at 6 o'clock the company were conducted to the dining pavilion, where an excellent repast was provided. The following was the bill of fare:

Clam Chowder.
Sliced Cucumbers. Sliced Tomatoes.
Olives.
Steamed Clams,
Hard and soft shell.
Baked Bluefish. Clam Fritters.
Boiled Lobster.
Broiled Spring Chicken.
Asparagus. Boiled New Potatoes.
Ice Cream.

At the conclusion of the repast Mr. Pierce of the American Radiator Company, on behalf of the manufacturers, in a few well chosen words expressed the warm feelings of regard held by the manufacturers of the various articles daily used in the steam and hot water fitting business toward their guests, and the gratification it afforded them to extend some little hospitality. In the course of his remarks he said that in spite of the tremendous financial storm which the country had suffered the manufacturers recognized the fact that during that time the master fitters of the United States had been exceptionally able, compared with other business enterprises, to pay their bills with 100 cents on the dollar. He eulogized their skill as mechanics and their home life, as exemplified in the presence of so many wives and daughters with them at the convention.

President Rutzler, on behalf of the National Association, thanked the manufacturers for their kind sentiments and for the entertainment which they provided so liberally at these conventions.

Geo. T. Coppins of the Walworth Mfg. Company, Boston, acceptably filled the office of tosstmaster.

The first toast was "The Master Steam and Hot Water Fitters' Association of the United States," which was responded to by A. B. Franklin of Boston. The next toast was "The New York Local Association," to which J. L. Wells responded. "Our Guest from England" was the third toast and it met with a hearty response by Mr. Nesbit. The fourth and last toast was "The Ladies," the duty of responding to which devolved upon D. M. Quay.

The company then embarked on the steamer for the return trip, the vessel reaching her wharf at about 10.30 p. m., from whence omnibuses conveyed the party to the hotel, where the opinion was freely expressed that a more delightful outing could not be imagined.

THE MODEL HEATING COMPANY send out a card announcing that they have opened an office in the Builders' Exchange, Room 303, 24 South Seventh street, Philadelphia, where they will be pleased to see their friends.

The Difference in Amount of Radiation Required in Buildings of Good and Poor Construction.*

BY E. P. BATES.

To illustrate the subject before us I will recite my experience in several buildings. In the fall of 1879 I placed a low pressure steam heating apparatus in a building designed for a home for old ladies. Many of the rooms were small, and in order to warm them without question a radiator was placed in each room. Knowing that a high temperature would be agreeable, the calculation was made that 1 foot of radiation would warm 40 cubic feet of air. This we considered very liberal when the fact that we used the Gold sheet iron radiator is taken into account. We were, however, doomed to a very serious disappointment, as the temperature in the rooms on the windward side of the house frequently fell to 50° and sometimes even below during severe cold and windy weather. After recousidering all the conditions we determined to add a large percentage of radiation, which was done, and the building has been thoroughly warm ever since. The amount of radiation added in many of the exposed rooms was from 50 to 100 per cent. over that originally supplied. To my mind the rooms in this building are very uncomfortable, for the excessive amount of radiation required to maintain the temperature produces a very disagreeable condition of affairs, together with the excessive loss of heat through the thin walls and many air leaks. It was soon found that although the ratio of radiation was very excessive, under the existing conditions the condensation was very rapid, and more boiler power was required to maintain the steam pressure. Consequently an additional boiler was supplied at the expense of the heating contractor, which gave plenty of generating power, but all this was accomplished at a heavy proportional loss to the contractor. To my mind, as I review the entire matter, I find that the original calculations for boiler and radiating surface were correct, providing the building in question had been ordinarily well constructed. But from subsequent surveys I conclude that the architect and building contractor produced about as poor a specimen as it was possible to do and have it stand up as a public building. The result is that the amount of fuel needed to warm the building is enormous.

HEATING A COLLEGE BUILDING.

I have in mind another building which belongs to one of our popular colleges. This building was constructed in 1872. The location was on the brow of a high hill, where the front was exposed to the force of the northwest winds. It was the intention of the heating contractor to make this building very warm, and all calculations were made with this object in view. After the apparatus was complete and the weather became cold it was found that many of the small rooms in the west front did not warm to the required temperature, and an investigation was made to determine the cause if possible. We referred to our calculations as to boiler, piping, radiating surface, &c., and found that the apparatus was constructed according to our calculations; nevertheless we were confronted with a number of cold rooms. We finally determined that the only way to satisfy ourselves was to live in the building and keep a record of the temperature, both in the rooms and outside. While this was in progress I visited the building one very windy day, and in entering some of the west rooms I was surprised to find that the hall door would be pulled away from me and shut with a report like a gun. I supposed at first that a window was open, but examination showed that they were closed as tight as possible considering their construction, but the air leakage was enormous, and a large quantity of air was constantly driven through the brick walls of the building. In fact, the volume of air forced into the rooms was so great that the hall door was opened with difficulty. The radiators in these rooms were liberally increased, and the warming of the building has been very satisfactory to its occupants. The heating contractor in this case did not meet with a decided loss, as a very liberal allowance for the exposure of the building had been made in the original calculations.

A STATE NORMAL SCHOOL.

Another striking case comes prominently before me. About eight years since I placed the heating apparatus in one of our State normal schools. The building was in a very exposed location, and the radiating surfaces were very carefully apportioned in order to fully meet all conditions. One large class room, containing about 100,000 cubic feet, was provided with 1 square foot of radiation to 40 cubic feet of space. This was thought to be excessive at the time, but we wished to do the work right the first time, and not have alterations or additions to follow the work, so the full amount of radiation was supplied. When the weather became severe this room was very cold, and radiating surface was added at various times until the ratio was brought up to 1 to 18 and the desired temperature secured. The larger part of the radiation was direct—in fact, all radiation which was added was direct. I found that while standing in the room during a severe northwest wind you could feel the wind on your face as it came through the wall of the building. In the illustrations cited the buildings were very carelessly constructed, the architects in charge giving very little attention to the minor details which have the most important bearing in the comfortable use of the building. I will now call your attention to the reverse of the conditions named above.

AN OVERHEATED RESIDENCE.

Last year I contracted to place a small hot water apparatus in an old residence which was being altered slightly and converted into a small apartment house. The building was not badly exposed, so the calculations were based on a moderate amount of radiating surface. The apparatus was complete in the fall and the tenants moved in. The fire had been started but a few days when there was a general complaint of too much heat, especially in the bedrooms. I found that the latter contained about 1500 cubic feet and a radiator of 32 square feet was used to supply the heat. Our advice was to shut the valve on the radiator and run the water at a lower temperature, and when very cold weather came they would be very happy with nicely warmed rooms. Our suggestions were partly followed, but the complaints of overheating were almost constant, and after passing partly through the winter both owner and tenants demanded that all the radiators be removed from all the bedrooms at least. This was done, and there remained in these rooms a riser of 1¼-inch pipe, which contained about 4¼ square feet of radiating surface in a room of 1500 cubic feet, or a ratio of 1 to 333, the bedrooms being outside rooms. I have never had the opportunity to examine this house, but there is no doubt as to its good construction. I might further say that I am advised that the temperature of the water is kept down to 140° to 160° in the coldest weather.

A WELL CONSTRUCTED STABLE.

A few years since I built a small stable. Its dimensions are 24 x 36 feet on the ground. The ground floor is used for a carriage room, horse stalls, harness room, &c. In practice the floor is commonly used as one room. Above is a hay loft, with a room for the driver over the harness room. To my mind it is desirable to keep the stable moderately warm through the winter and to accomplish this with a moderate outlay in apparatus and fuel. Over the horse stalls is a ventilating pipe running through the roof; this pipe is 12 inches in diameter and is always open, summer and winter; usually the air is going through it at a high velocity. There is no especial provision to bring air into the stable, but the doors and windows are ordinarily well fitted, and there are large leaks about the entrance to carriage room, which has a sliding door about 9 feet square and opens to the north. In using the stable no difficulty was found in warming it to 60° in the most severe weather, and an ordinary globe stove was used with a grate 8 inches diameter. The amount of fuel used per season is between 3 and 4 tons. The stove pipe passes through the driver's room and the heat given out by the pipe maintains a comfortable temperature in that room. I believe this stable is more comfortable in summer and winter than the average

* Read at the sixth annual convention of the Master Steam and Hot Water Fitters' Association of the United States, New York, June 19–21, 1894.

stable, although many of them may be much more expensive in construction. The stable is built of wood, the frame is balloon style, the upright studs are 2 x 4 inches set about 16 inches to centers. On the outside of these studs I placed a course of rosin sized paper and one thickness of coved siding. In order to prevent the buckling of the paper at the laps and to prevent a rapid change of circulation of air between the studs, I placed a 2 x 4 inch lengthwise (between the up right studs) on the sill, then once in 3 feet cut in a 2 x 4 inch as an addition girth. The paper being a yard wide abutted on this extra girth, which held the edges tight and prevented the circulation of air from cellar to hay loft, and *vice versa*. On the inside of the carriage room, as well as other rooms on the ground floor, a course of building paper was used and ceiled over with ⅛-inch narrow Canada pine for a finish. Under the floor of the hay loft was laid a course of building paper, also on the ceiling of carriage room before the ⅛ inch wood ceiling was laid. At the top of carriage room where the studs and joist join I stopped off with boards to prevent circulation of air. The idea of using the cross girths once in 3 feet and building paper on the inside of the walls was very amusing to the old carpenters employed on the work, but it is very satisfactory on a cold day and equally so in hot weather, the building being much more comfortable than many dwellings which are built at a much greater cost per cubic foot. It will be noticed that the stable here described is of very inexpensive construction, and would be very cold in winter and hot in summer except for the succession of dead air spaces in the walls, cove siding being one of the poorest materials for keeping the wind from penetrating a building.

HOW A HOUSE WAS BUILT.

Believing that I was correct in theory, I determined to carry out my ideas more carefully in the construction of a house two years since. This house stands alone, fully exposed on all sides, on high ground in Syracuse, where the temperature frequently falls below zero and occasionally 15° to 20° below zero It is constructed of wood and is comparatively inexpensive. The frame is what is known as balloon with slight modifications. On the outside of the frame are placed hemlock boards planed on one side, and over the hemlock is placed a course of heavy building paper, care being taken to leave no bare places or uncovered knot holes, also that the paper fitted properly around all corners, windows and door frames A 2 x 4 inch was nailed to the sill to prevent the air from cellar going to the attic, or *vice versa;* once in 3 feet a cross girth 2 x 4 inches was cut in between the upright studs to make a dead air space in the walls. This was also done in the partitions. At the ceiling of each story a board to fill the space between the joist was inserted ; said board was covered with building paper. Over the partitions in the center of the house a stop off was inserted in a similar manner to prevent the air from passing from side to side of the house and cooling the ceilings of the various rooms. The roof boards were covered with paper before the shingles were laid. Every point was carefully looked after to prevent air leaks, the object being to get dead air spaces in all the walls as far as it was possible to do this.

THE HEATING APPARATUS.

The next point was to install a good warming apparatus, and after having the old saw about shoemakers' wives and blacksmiths' horses handed to me several times I determined to erect a heating apparatus which would surely warm the house every day. I therefore placed in the house a Bates self-feeding boiler No. 6, containing 103 square feet of fire surface. This boiler is brick set. Allow me to speak of a peculiarity of this boiler. Quite different from many which are advertised, it does not save any coal. They will burn all you fire into them, but if the firing is done with any reason the boiler will give you an equivalent in heat for every pound of fuel it consumes. The house in question being three stories, it was decided to make a combination apparatus—*i. e.*, hot water and steam, using hot water stacks for the five principal rooms and steam radiators for bath, back hall and the small bedrooms. The hot water was circulated from the water line, the boiler being set in the usual way for carrying steam, with automatic water feeder, automatic draft door, &c. I placed in the house, which contains about 16,000 cubic feet of space, 457 square feet of radiation, equal to 1 square foot to 33 cubic feet of space to be warmed. Of the above 350 feet was in the indirect hot water stacks and 127 square feet distributed in seven small radiators. For ventilation I built one chimney stack, which connects conveniently to most of the rooms. In this chimney stack I placed eight tile flues made of vitrified pipe without hubs, and all 8 inches in diameter except the flue for the fire place in dining room, which is 10 inches in diameter. These flues are used as follows: One for steam boiler, one for laundry stove, one to ventilate laundry, being three in basement: on ground floor one for fire place, one for range, and one for hood over range to take off heat and vapor from cooking, being three on ground floor. On the second floor there is one flue from the large bedroom, at the base of which is set a Franklin stove, and the other and eighth flue in the back hall. The bathroom being several feet away from the chimney has a separate flue of tin and galvanized iron extending through the roof independently with a Globe ventilator on top. Every test made shows each flue carrying out a large amount of air, and those flues to which fires are connected are very satisfactory, in fact they never fail to draw, and the course or velocity of the wind seems to make no difference, so it is evident that a rapid change of air is going on constantly.

RESULTS.

As to results. When the thermometer registered 5° below zero during the past winter we used one stack of pin radiators in the reception hall. Said stack contains eight sections The register over the other stacks were kept closed, a radiator of 16 square feet in back hall of second floor was filled with steam, and a radiator of 18 feet on third floor was partly filled equal to 10 square feet, or in all 108 square feet in active operation in severe weather. There is no doubt that we receive some benefit from the stacks where the registers are closed, as there is a small percentage of leakage through the registers, and some heat given off by the tin flues running to the upper rooms. If only 108 feet were used the ratio would be 1 to 135. After having several cold days and demonstrating the fact that the amount of radiation was greatly in excess of the amount which could be possibly used, radiators were removed from the house to the amount of 86 feet of direct radiation and 60 feet of indirect, the latter being the stack placed to warm the drawing room and was not used, as the room was thoroughly warmed by the hall stack. It was found also that during the coldest days and evenings it was comfortable to sit in any part of the house, even the rooms where the registers were closed; also that the difference in temperature between the outside and partition walls was slight. One fact worth mentioning is that the bathroom was in constant use, and that it was designed to heat it by means of a brass coil, nickel plated, containing 20 feet of 1-inch pipe, but the valve was not opened during the winter, the room being comfortable at all times to take a bath. During this season it is my intention to extend the tin flues to three bedrooms from which the direct radiators have been removed, as the stacks are abundantly large to supply them with heat. I might say in explanation that I should not have carried heat enough to raise steam, but for the fact that one of the upper rooms was used for a sewing room, and steam was required to reach that room. In my opinion I shall not need to carry the water above 180° the coming winter to perfectly warm the entire house. Under the conditions here described the boiler ran with the minimum of care, the draft door remaining constantly closed days at a time; the grate was shaken once in 24 hours in the most severe weather, and only once in 72 hours in very mild weather. With a temperature of 32° outside, water at a temperature of 110° to 120° at the boiler was sufficient.

THE APPLICATION.

The question may now be asked, what has all this matter of construction to do with our craft? We do not build houses or other buildings—we must take them as we find them, good, bad and indifferent, and place in them a heater that will fill our guarantee, be it more or less. This is a fact from one standpoint ; there is, however, another view to take of the subject. Every trade is responsible for existing conditions to a certain extent. By agitating a subject we bring about reforms, and if $15 to $40 judiciously expended in the construction of a small residence will save the full amount in the value of fuel in one or two seasons and add largely to the comfort of the occupants all the time, our efforts are well expended in diffusing the knowledge of the fact, and intelligent inquiry will be well rewarded in its research. Further, we all make our great successes in well constructed buildings, and our failures and sometimes losses in those of poor construction. With this in view I hold that it is largely to the interest of the steam fitter and heating engineer to promote in every way possible the desire which the owner and architect may have for a well constructed building "Continual dropping wears the stone."

"FOOD FOR THOUGHT" is the motto on the outside of a miniature meal bag that rouses the curiosity. Further investigation reveals a circular within this little receptacle telling about the Ideal boiler made by the Ideal Boiler Company, 36 Dearborn street, Chicago.

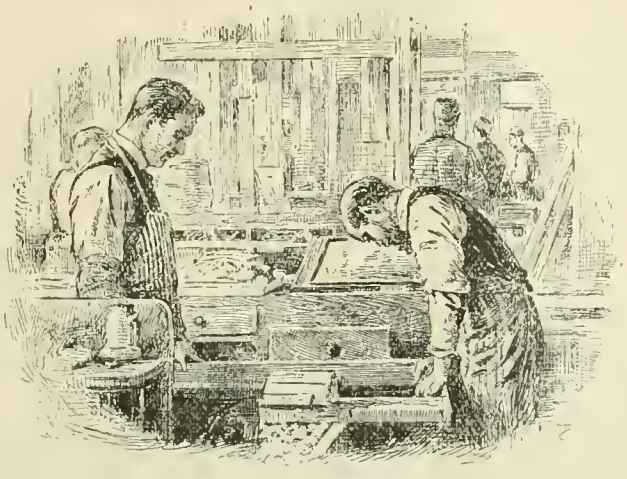
Wire Ropes.

At a recent meeting of the Yorkshire College Engineering Society, in England, Herbert Cheesman of the Hartlepool Ropery Company, Hartlepool, England, read a paper on "Wire Ropes," of which the following is an abstract. After describing the general construction of wire ropes, the lecturer urged the necessity of using wire having the same modulus of elasticity throughout one rope. The object of all rope manufacturers is to obtain an ultimate strength for the whole rope equal to the sum of the strength of the separate wires, and the only way of attaining this result is to use material of precisely similar elastic properties. Another very important point brought forward was the initial torsion given to each wire in the formation of the strands by the "sun and planet" mechanism. This system of preparing the strands is very generally supposed to prevent any twist being given to the separate wires, but it was clearly demonstrated that a slight axial rotation of each wire is necessary to entirely prevent any torsional stress being put upon them. Mr. Cheesman has now brought out a machine which enables the operators to adjust this axial movement to the requirements of the lay of the strand. In speaking of the rotation of wire ropes, Mr. Cheesman pointed out that all long ropes not of a perfectly cylindrical form must necessarily rotate, though they may be fixed at both ends, for they always tend to follow the path of the greatest bearance, which is down the spiral of the rope. This tendency increases with the weight lifted, and he had observed that by raising a kibble empty it made five revolutions, while with the weight of two men it made 11, and when filled with earth 19. The rotation of the rope is advantageous in equalizing the wear. Illustrating the advantages of internal lubrication, Mr. Cheesman quoted the experiments of A. S. Biggart. An unlubricated rope stood 16,000 bends before fracture commenced, while the same rope when lubricated stood 38,000 bends over the same pulley. Another similar test showed that the life of the rope was just doubled by internal lubrication.

The engines of the new United States cruiser "Cincinnati" were given a dock trial last week in the Brooklyn Navy Yard, with very satisfactory results. The "Cincinnati" was designed and built by the Government. Her engines develop 10,000 horse-power and are expected to make over 20 knots on her official trial.

A Visit to a Stove Foundry.

A modern stove foundry is a very complex institution. According to a high authority no less than 25 trades are represented in such an establishment. They comprise designers, modelers, wood pattern makers, plaster workers, iron pattern makers, polishers, electro platers, buffers, carpenters, follow boarders, japanners, casting scratchers, floor molders, bench molders, cupola melters, grinders, mounters, inspectors, tinsmiths, sheet iron workers, brass workers, blacksmiths, flask makers, pipe fitters and machinists. These are by no means forced classifications, with groups of workmen who are sometimes craftsmen of one sort and then of another. Every man employed has a special function in which he is as far as possible an expert. Such an explanation is a necessary preliminary to a description of the art of stove founding as conducted according to the most approved methods of the day. For this purpose the works of The Michigan Stove Company, at Detroit, Mich., have been selected.



A Corner of the Wood Pattern Shop.

Before entering upon technical details, a brief history of The Michigan Stove Company will be of interest, as showing the origin and growth of the establishment which now occupies so prominent a position in the stove trade. The organization of the company dates back to 1871, when articles of incorporation were taken out by Charles Du Charme, Jeremiah Dwyer, Merrill I. Mills and R. H. Long. The central figure in this group of persons was Jeremiah Dwyer, who was the pioneer stove manufacturer of Detroit, having founded in 1862, before the incorporation of any of the present Detroit stove companies, the firm of J. Dwyer & Co., exclusive manufacturers of stoves and ornamental castings. Ground was broken on the present site of the works in March, 1872, and the first heat was taken off in the foundry on September 12 following. The officers of the company at that time were as follows: Chas. DuCharme, president; M. I. Mills, vice-president and treasurer; Jeremiah Dwyer, manager; R. H. Long, secretary. In 1873 George H. Barbour was elected secretary to succeed Mr. Long, who became superintendent, holding that position until his death on April 3, 1876. Charles DuCharme died January 9, 1873, and was succeeded as president by Francis Palms, who held the position until his death in November, 1886. In August, 1872, M. B. Mills became associated with the company and was elected a director in 1878. Charles A. DuCharme entered the company in 1879 and became a director in 1882, when he was also made purchasing agent. The Chicago house was established in January, 1879. On January 1, 1882, Frederic W. Gardner became associated with the company, assuming the management of the advertising department and Western business. The officers of the company at present are as follows: Jeremiah Dwyer, president; George H. Barbour, vice-president and general manager; Merrill B. Mills, treasurer; Charles A. DuCharmet secretary; William A. Dwyer, purchasing agent; William J. Keep, superintendent; Frederic W. Gardner, Chicago. Western manager. The present directors are as follows: Jeremiah Dwyer, George H. Barbour, Charles A. Du Charme, Merrill B. Mills, Francis F. Palms, William A. Dwyer, Edwin S. Barbour 2d, M. W. O'Brien and Frederic W. Gardner. The capital stock of the company was originally $100,000, and was increased at various times until it is now $300,000, but the actual investment in the business is about $1,000,000. The pay roll in 1892, which is taken as an average year, was $595,974, and 75,699 stoves were made. The quantity of pig iron melted in that year was 11,632 tons. The average number of men employed is 1200, and they are kept at work as far as possible every working day in the year to secure the best economical results.

Coming to the methods of manufacture pursued in this establishment as typical of modern practice, the starting point is naturally in the designing room. The high class stoves of to-day not only require the most expert workmanship in their construction, but they compel the employment of creative genius of a peculiar character. Artistic talent must be united with practical ideas. The first step taken is to decide upon the internal construction, arrangement and size of fire pot, grate, flues, oven or heat chambers, dampers, ash pit, &c. The demands of the trade, as gathered through salesmen or direct from consumers, may govern many of these points, or they may have been settled by practical tests instituted for the purpose. Every point in this direction having been covered, the designer comes forward to prepare the shell or overcoat. He makes a flat drawing of about one quarter size, in which the shape, proportions and ornamental features are set forth in sufficient detail to enable his ideas to be clearly grasped. The design is then subjected to severe criticism by experts, and it may be found that a most striking design which would make a very effective piece of stove architecture is impracticable on account of excessive difficulty in reproducing it in cast iron. The design having been approved as drawn or modified, it is then enlarged to the full size of the stove and further criticised. This will probably bring about numerous changes. The next step is to prepare a full-sized clay model. For this purpose a shallow wooden trough is made of the proper width and length for the side of a stove and having the sides beveled to the exact miter. In this trough a perfect reproduction of the accepted drawing is made in clay, requiring great skill and artistic taste. Tops and bases are handled in the same way.

From the clay models plaster casts are made which, when completed and their surfaces blackened, are set up in the semblance of a finished stove. More criticism follows and perhaps much of the work is condemned and must be tried again. Thus the design goes forward slowly. The more elaborate parts are now transferred to wood. Wooden blocks of suitable size are carved into an exact representation of the design. According to old methods these blocks would be hollowed out on the reverse side to the proper thickness for patterns and be used as such—a very expensive as well as unreliable process. By the improved method of The Michigan Stove Company a wax impression is taken from the carved surface and it is used in the preparation of a special metal pattern, composed of lead and tin, cast with the usual allowance for shrinkage in the subsequent stove castings. A

View in the Molding Shop.—Ramming Sand in Flasks.

durable pattern is thus secured which will admit of any kind of rough handling and will not warp when stored away. These special metal patterns are used for the most ornamental or intricate parts of stoves. Wood patterns are made for the plainer parts, as they can thus be more easily and less expensively produced or duplicated. Iron patterns are copies of the special metal and wood patterns. They are finished in the iron pattern shop after they have been cast from the originals. To expedite work in the foundry it often becomes necessary to have a considerable number of patterns of some one part. The equipment of a metal pattern shop consists mainly of vises and files. Surfaces are here made as smooth as glass and abutting edges are fitted together precisely. A small brass foundry is often a necessary adjunct, as holes in the iron patterns are closed with brass, defective edges are filled and straightened and additional pieces are sometimes brazed in place. The pattern department of a large stove works is one of the most expensive in the whole establishment, as will be inferred from the foregoing statements. The pattern expenditure of The Michigan Stove Company for 1892 was very nearly $50,000.

The work of preparation being thus set forth, the patterns will be followed to the foundry. Here, under one roof, all the molding is done. The following description of stove molding is from the pen of Superintendent Keep:

Stove castings are made in two-part flasks, consisting of cope and nowel, hinged at the rear. The pattern is so made that the cope can be rolled off, without loosening with wedges if possible, and give a clean lift (no rats), and bars with nails driven in them are so located as to anchor every hanging core. No separate cores, green or dry, are used in stove work, and the size of the flask leaves only 1 inch of sand outside the edge of the pattern. Stove patterns are of iron filed as smooth as possible, and waxed to prevent rusting. They are boarded face up, that is, fitted to a wooden follow board to give the under side a bearing to prevent breakage, or springing by ramming.

The follow board has wooden cleats on the back, which are bedded in sand on the molding floor, that it may lie perfectly solid. All dust and moisture are brushed from the pattern, as the slightest rust will make a rough surface on the casting. The nowel, which has no bars, is placed on the follow board and sand is riddled through a No. 12 sieve, to lie ¼ inch deep on the pattern. Then sand from the heap is shoveled to fill the flask. This is rammed and leveled off with a straight edge. Sand is thrown over this and a bottom board is rubbed down to give a true bearing surface. This bottom board has holes in it to allow gas to escape.

Iron clamps are placed on each side and the box is rolled over, allowing the cleats of the bottom board to rest on a sand leveled floor.

The follow board is then lifted off, leaving the pattern buried in the sand. If the parting line is not firm, the molder presses sand with thumb or trowel until the edge of the pattern makes a perfect parting with the sand. Parting sand, which is burned molding sand, is thrown over the whole surface, and what has fallen on the pattern and any superfluous quantity is blown off with a bellows.

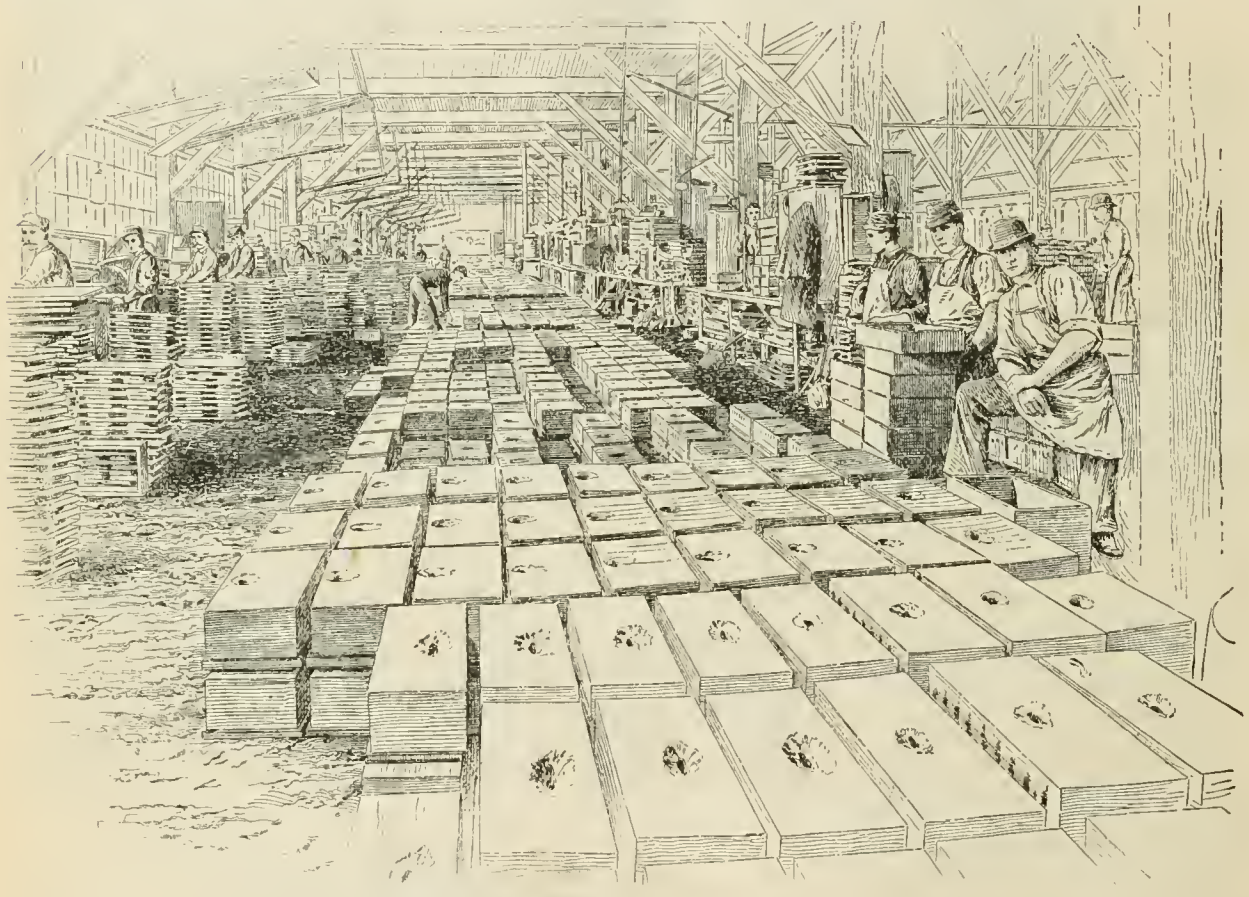
The parting is made by the close fitting of the follow board to the pattern, and any crooked corners are built up with pieces of old leather belting. If the casting is to be run from the edge, iron set gates are placed against the edge of the pattern on the follow board and molded in the nowel.

The parting sand having been blown off, the cope is placed on the nowel and clamped in place, and sprues are placed in position. Flat sprues are set on the pattern, bottom side up. Sand is now shoveled in, and with the hands is tucked under the bars and around the sprues, the flat ones being turned over. The cope is then filled with sand and rammed, the superfluous sand being brushed off. The cope is then rolled off, and rests on its hinges and on a box placed in the rear. The sprues are drawn out, and the inner opening is trimmed with a slick to prevent loose sand breaking off with the inflowing iron. The pattern is now withdrawn, and if there are any imperfections in the mold they are repaired. Heavy facing is shaken over the mold, and when the cloud has settled, light facing is shaken over this, both from muslin bags. The pattern is now printed back, the set gates are withdrawn, and the pattern is removed.

The heavy facing is to prevent the iron burning the sand and to give a smooth surface and a good color. The light facing is simply to prevent the pattern from sticking to the heavy facing. If any heavy facing should stick, it would leave a rough spot—if too much light facing is used it will wash and run before the iron and will make a worse surface than sticky heavy facing.

The mold is now closed and clamped exactly as it was when rammed up.

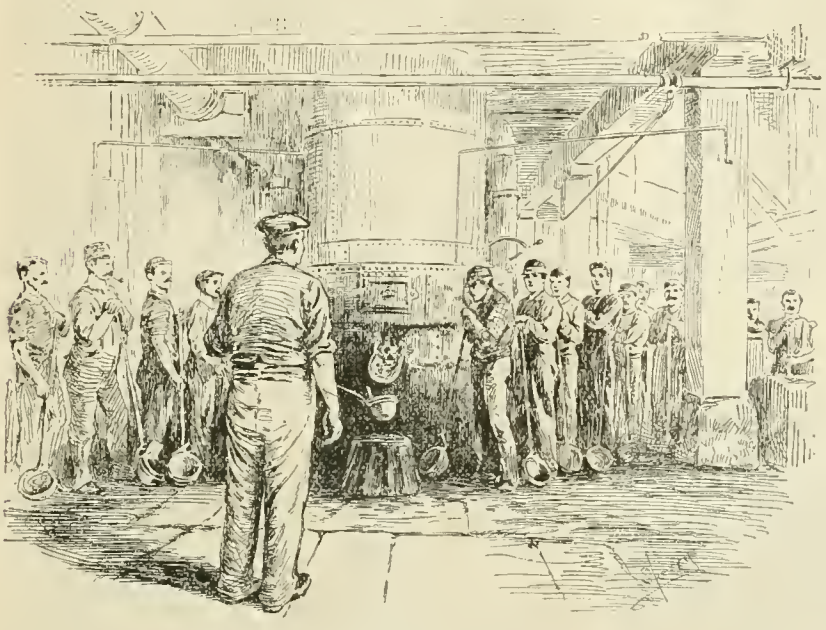
The snap floor extends almost the full length of one side of the foundry. It is intended for molding small pieces. For this purpose snap flasks are used. These flasks are made with hinged sides, fastened by a hook or snap. After the sand has been rammed in place and the pattern removed, the flask is unfastened, taken off and used with another pattern. The sand retains its position for a small casting without the support of the flask. In this way comparatively a few snap flasks form an equipment for a large floor, avoiding the investment of capital in numerous flasks. Large pieces, however, must be molded in stationary flasks, as previously described. These are laid out in floors from 7 to 9 feet wide and about 28 feet long, holding two or three rows of flasks, with one molder to each floor.



East Snap Flask Shop.

The process of casting is very interesting. Two cupolas are in use, located some distance from each other, so as to be convenient to all parts of the molding shop. One is 6 feet 8 inches in outside diameter and the other 6 feet. In these alternate layers of coke and pig iron have been dumped from an elevated platform. After they have been fired, the heat is intensified by a blast of air from a blower in the engine room, connected with the cupolas by under-

ground pipes. This operation is so timed that the molten iron will be ready for pouring when the molders have completed their work of preparing the molds. The cupolas are supported on posts of a proper hight for drawing the metal from the bottom into hand ladles. Everything being in readiness, the molders gather in regular lines with their long handled ladles to receive the liquid iron. The blast is



Ready for Casting.—No. 1 Cupola.

checked, the tap hole is opened and the fiery stream flows down a short spout to be caught by one ladle after another and carried to the different molds. Here a helper with a suitable implement skims the slag or oxidized metal from the top of the ladle, so that only the pure stream of iron flows into the pouring hole in the mold. If the castings are small, the molder flits rapidly from one to another mold, leaving but part of the contents of his ladle in each. If the castings are large, several molders may at the same time pour from their ladles into the one mold. When the ladles are empty they hasten back to have them refilled until the molds have all been properly attended to. It might be supposed that some better plan could be adopted than that of carrying the ladles by hand to all parts of the foundry. Labor-saving devices have been tried in stove foundries, but have been abandoned as less satisfactory than the hand ladles. An enormous amount of metal is carried in this way. The two cupolas referred to melt an average of 67 tons per day, their output having run up as high as 71 tons 13 hundredweight. The men all work here by the piece, every effort being made to help them to earn as much as they can, because in this way will the company also make the most money.

Mr. Keep uses in this foundry his well-known test of cast iron, by which uniformity in results is secured. An iron follow board is used, with gated patterns of a square and flat bar. On this board are placed a pair of yokes, with parallel chilling surfaces 12½ inches apart. The ends of the bars run against these surfaces when poured. The yokes and bars are then taken out of the sand, carefully cleaned and placed on a measuring table, which is a counterpart of the follow board, with openings through it at both ends of each bar. The bars and yokes are placed on it exactly as they were in the mold. The shrinkage of the bars from the yokes is then measured with a graduated steel wedge or gauge measuring $\frac{1}{100}$ inch. This will show whether the shrinkage is too great or too little, and whether the iron used contains too little or too much silicon, when the proper remedy can be applied by changing the mixture of iron at the cupola. The same bars are used for making tests of transverse strength and for ascertaining the depth of chill. These tests are carefully and very regularly made, so that the utmost precautions can be taken to insure sound, strong and perfectly fitting castings. Small quantities of aluminum are also used in the cupola mixture, as that remarkable metal, it is said, imparts beneficial properties to iron, making it pour more smoothly, preventing blow holes and making castings less liable to break.

From the foundry the castings go to the scratch room, where the large pieces are cleaned by hand with steel wire brushes and the smaller pieces are cleaned in tumbling barrels from which the dust is exhausted by a large fan. The tumbling barrels are large horizontal cylinders strongly made of cast iron. A portion of the shell is removable, for the purpose of putting castings in and taking them out. On account of the great weight of barrels and contents they are operated by cogged gearing. The cleaning room is located so as to be easily reached from all parts of the foundry. From this point two routes are taken by the different classes of castings. By one route the plainer portions pass to the mounting shop, while by the other route the pieces to be ornamented, japanned or nickeled pass forward until they meet the finished stove in the inspecting room. A system of shelving has been constructed as an adjunct to the scratch room, with a separate rack for each kind of casting large enough to hold the number of pieces made in four days. In the mounting shop a sufficient space is allotted to each man to assemble the parts of a stove, which are brought from the shelves in truck loads. He has graded emery wheels, driven by power, for grinding edges, at which either he or an assistant finishes the castings so as to make them fit nicely in their places. All doors and close joints are fitted with files. The castings which are taken by the other route go to the grinding and polishing room, in which there are emery wheels of many sizes and shapes. Some of these wheels have convex surfaces to work in indentations, while others have concave surfaces to work on curved castings. These wheels are made on the premises, so many being used that a special department was formed for the purpose. Circular wooden blocks constitute the centers. A heavy coat of strong glue is applied to them, after which they are covered with ground emery of varying degrees of fineness, according to the work to be done. Polishing follows the grinding. This is accomplished with very fine emery wheels and bull-neck wheels made of heavy leather. No belts are here used for polishing, as it has been found that better results are obtained with wheels. Parts to be japanned are taken to the japanning department, which contains a complete equipment for applying the durable glossy coat. They then go to the gilding, ornamenting and striping department. The parts to be nickeled receive much more elaborate treatment. They are placed in tanks and scrubbed with potash and hot water, then with pumice stone, after which they are washed in hot water and lastly with cold water, when they are ready for the nickel bath.

In the Polishing Room.

The nickel plating department of this establishment is on an unusually large scale to meet the requirements of the company's business. Special dynamos furnish the electrical current necessary, and about 6000 gallons of solution are in constant use.

After remaining in the nickeling tanks a sufficient time the castings are taken out and dried, when they pass to the buffing room, in which the wheels used are made of Spanish felt. This imparts the very high polish that is a conspicuous feature of nickeled work. From the buffing room, after the pieces are carefully inspected, the next step is to the nickel packing room and from there to the general inspecting room, where decorated parts meet the completed stoves from the mounting shops. Crating with wood next follows, after which the stoves are either shipped or stored in the warehouses to await the demands of the trade.

A peculiar feature of the stove business, in which it is unlike almost any other manufacturing industry, is the practice of furnishing repairs or new pieces for any part of a stove. As there are from 75 to 300 separate pieces in every high-class stove, and such stoves are made in a variety of styles and in a number of sizes, requiring an immense number of special castings, it will be seen that the furnishing of repairs is a most intricate matter, requiring elaborate arrangements in order to conduct it satisfactorily and economically. The Michigan Stove Company's system is very complete. In the basement of their main building, and overflowing into an extension which was found necessary, are an enormous number of racks, laid off in aisles, built up to the ceiling, and all numbered and indexed, in each of which are stored parts of stoves. This part of the establishment is appropriately christened "the catacombs," as it is a perfect labyrinth of passages in which it would be an easy matter for a visitor to lose himself. The racks are constructed so as to hold a certain number of pieces, and whenever one becomes nearly empty orders are sent to the foundry for more castings of the same pattern. From this stock any part needed to repair any stove made by the company from the beginning of the business can be furnished instantly, or all the parts essential to the construction of a stove of a particular pattern can be easily assembled.

In the Grinding Room.

Manganese Ore in Russia and Greece.

In a late report to his government the British Vice-Consul at Poti, in the Caucasus, makes the following statement in regard to the production of manganese ore in that district: "The Caucasian manganese appears able to compete with that of any other part of the world, and is largely shipped, not only to England and the Continent, but also to the United States. Last season did not, however, prove a profitable one to those engaged in the trade, partly on account of the drop in prices owing to the anticipated opening of the railway to the mines, partly because of bad trade in England and America The new narrow gauge railway from Chiatur to Sharopan was opened during the autumn, but frequent landslips and the want of sufficient rolling stock have hampered its operations, and it does not appear probable that for some time it will be able to bring down nearly all that is mined. Ultimately the effect will be to divert the trade entirely from Kvirili, its present headquarters, to Sharopan and Chiatur, the termini of the branch line." Another agent of the British Government, James Boyle, in a report on the trade of the Laurium district of Greece, shows that the production of manganese ore in that district amounted in 1893 to 178,098 tons. In connection with the subject, Mr. Boyle makes the following observations: "It may interest buyers in the West of England to know that new discoveries of large lodes of manganese iron ore are rendering it very abundant. Attention should also be called to the fact that the best of these ores is often slightly impregnated with arsenic."

Cast Iron vs. Forged Soft Steel Brake Shoes.

Charles T. Schoen has written to the *Railroad Gazette* a letter on the relative merits of cast iron and forged soft steel for brake shoes. He says:

The question as to what metal is best adapted for use for brake shoes is of vastly more importance than one would suppose, if only a passing thought be given it. The main points to be considered in deciding the question are: First, economy in wear, considering the first cost of each; second, relative wear of wheels; third, the coefficient of friction or retarding power.

It has been demonstrated by tests in service that one brake shoe made of forged, soft, low carbon steel will outwear about seven cast iron shoes; or, in other words, the wear is 1 pound of soft steel shoe to 8 pounds of the cast iron shoe for the same service. This answers the first question to be considered in favor of the soft steel shoe, because the cost of it per pound is but three times that of cast iron, while the demonstrated practical value is eight times.

The second proposition is the relative wear of wheels, and there has been room for doubt whether the soft steel would not wear the wheel faster than cast iron; this doubt comes from the fact that friction has generally been connected with wear, the assumption being that the greater the wear the greater the friction, but this is now known to be dependent upon the nature of the material. The results, from a long period of tests, show that soft steel does not wear steel tires or chilled wheels any more than, and not as much as, cast iron shoes. The reasons for this are obvious: The steel shoes to wear the wheel faster than cast iron would have to be harder, but the fact is they are softer, having only 0.10 carbon. The question naturally arises, If the steel is softer, how is it that it only wears one-eighth as fast as cast iron? The answer is simple, and embodies the secret of the economy of the soft steel shoe. Soft Bessemer steel is homogeneous, and the molecules, although soft, hang tenaciously together and resist separation, so that they are not readily pulled apart by the friction, thus reducing the wear. Cast iron, on the contrary, is not homogeneous, and the molecules are not held together with anything like the force that exists between the molecules of soft steel, and the particles separate easily and fly off, just as the particles fly off from emery wheels. In other words, the real cause of the excessive wear of cast iron shoes is the waste occasioned by the separation of the particles from each other, and the falling off without having performed any really useful function in braking.

The third question about the coefficient of friction, or retarding power, is one that is still unsettled. The reports of tests show that the retarding power of the soft steel is as great as, if not greater than, that of cast iron. Yet we can easily see how the retarding power would not be as great with hard steel shoes as with cast iron, but on this point it is well to wait for the data from the M. C. B. Committee on Laboratory Tests before going too far in reaching a decision as to the coefficient of friction.

Besides other incidental advantages of a long wearing soft steel shoe, there is the all important one of the less number of times the shoe has to be changed, and the decreased inspection required to keep up the slack.

Great interest is felt in the criminal proceedings taken by the District Attorney at Washington against the newspaper correspondents who refused to testify before the Senate Investigating Committee, now sitting to inquire into what is known as the "Sugar Scandal." Indictments have been found against the correspondents, and they will be tried in the Criminal Court.

TRADE REPORT.

Metal Market.

Pig Tin.—Excessive supplies and a spiritless consumptive demand have induced a weakness in the market for Pig Tin. Sales of comparatively large lots have been made as low as 19.57½¢ for July delivery and 19.65¢ for the balance of the year. Jobbers' prices for small lots of Straits Pig rule from 20¼¢ to 21¢ ℔ lb.

Copper.—Business during the week has been so narrow that the present true market value of Copper is extremely difficult to arrive at. The consumption, according to most accounts, both in this country and in Europe, is fairly liberal and has been somewhat stimulated by the unusually low prices that have prevailed of late. Yet orders from small consumers appear to be no larger in volume, and jobbers' prices remain unchanged at former quotations.

Sheet Copper.—The demand has eased off somewhat as compared with last week, leaving much to be desired by manufacturers of Sheet Copper. Prices for Manufactured Copper remain at their former level.

Pig Lead.—A fairly large business has been transacted during the week, and prices show more firmness. It is stated that washouts at producing points have checked the output more or less, that smelters are well sold up and that speculative holdings have been reduced to comparatively small proportions. Jobbers ask from 3⅝¢ to 3¾¢ ℔ lb for American Pig.

Lead Pipe and Sheet.—The market is very flat and consumers continue indifferent. The manufacturers have issued a revised price-list for Pipe and Sheet Lead, to which reference is made in another column. The reduction amounts to ¼¢ ℔ lb on Pipe and ¼¢ on Sheet, with the usual 20 % discount.

Spelter.—No change has taken place except perhaps that the better tone which developed last week has made some headway. That is to say, the offering is more reserved and it is more difficult to buy at prices that were commonly quoted early in the month. The common price asked for small retail lots of Western is 4¼¢ ℔ lb.

Antimony.—The market has been quiet and prices have shown very little change. Jobbers' prices for small lots is about 10¾¢ for Cookson's and 9¾¢ for Hallett's.

Nickel.—The popular quotations are 45¢ @ 50¢ for fair sized lots.

Tin Plates.—There has been little change in the Tin Plate market, or in the character of the demand, which is still confined largely to purchases of moderate quantities for immediate consumption. Some fair spot orders have been placed, and a few transactions in futures are noted. The market, as a whole, has, however, been irregular, reflecting the condition of uncertainty in which consumers are now existing. A number of large users of Tin Plates are supposed to be holding off their orders until the last possible moment, in view of the probable imposition of tariff changes. The domestic manufacturers are almost all as busy as they can be, with orders enough to keep their works running for some time to come. Prices keep remarkably level, though they are still low. A special cable dispatch to *The Iron Age*, dated London, June 20, reports that Tin Plate prices in the British market have further hardened, but the demand is not equal to expectations. Forward business is restricted, as sellers expect a good advance shortly. Fair sales have been made of 14 x 20 Bessemer Cokes at 10/3 and Siemens at 10/6, f.o.b. Swansea. Present quotations at that point are as follows:

Bessemer Cokes, 14 x 20	@ 10/3
Siemens Cokes, 14 x 20	@ 10/6
Ternes, double box	@ 19/
Charcoals	13/ @ 15/

Sheet Iron.—A good business has been done in Black Sheets for roofing purposes, and the demand from Tin Plate manufacturers increases weekly. Mills are hastening to place Tin rolls to meet the growing requirements of this industry. Prices are firmly held. A good inquiry is reported for Galvanized Sheets, but manufacturers are not disposed to quote for extended deliveries. The discount quoted for small lots from store is 75 @ 75 and 5 %.

Chicago Report.

Scrap.—Dealers continue to quote the following list of buying prices, Chicago delivery:

	Per net ton.	Per ℔
No. 1 Wrought Scrap	$7.00	....
Machinery Cast	6.00	....
Malleable Cast	5.00	....
Stove Plate (free of burnt)	4.00	....
Burnt Iron and Grate Bars	3.00	....
Sheet Iron and Hoops	2.00	....
Plow Steel and Breaking Stock	4.00	....
No. 2, such as Shovels, Hoes, &c	3.00	....
Old Boilers—whole (Iron)	3.00	....
" (Iron)—cut in single Sheets and Rings	5.00	....
Old Gas-Pipe and Boiler Tubes	5.00	....
Cast Borings	3.00	....
Turnings	4.00	....
Horseshoes	8.00	....
Copper Bottoms	....	5½¢
Copper Clips and Heavy	....	7 ¢
Heavy Brass	....	5⅛¢
Light Brass	....	3 ¢
Pipe Lead	....	2¼¢
Tea Lead	....	2 ¢
Zinc	....	2 ¢
Rubber	....	3½¢

Anthracite.—Carload lots of 12 net tons or over are quoted as follows:

	Grate.	Egg, Sto and Ch
Chicago, Ill	$5.25	$5 50
Milwaukee, Wis	5.25	5.50
Kansas City, Mo	8.45	8.70
Council Bluffs, Iowa	8.45	8.70
Lincoln, Neb	8.60	8.85
Sioux City, Iowa	8.45	8.70
Aberdeen, S. Dak	8.50	8.75
Dubuque, Iowa	6.55	6.80
Madison, Wis	6.75	7.00
St. Paul, Minn	7.75	8.00
Burlington, Iowa	6.75	7 00
Des Moines, Iowa	8.20	8.45
Davenport, Iowa	6.55	6.80
St. Joseph, Mo	8.45	8.70
Leavenworth, Kan	8.45	8.70
Omaha, Neb	8.45	8.70

TARBOX MFG. COMPANY, New London, Conn., proprietors of the well-known Tarbox Stove Gloss, are putting on the market in 10-cent bottles what they describe as "The Nineteenth Century Stove Polish" and sell under brand 13½. It is a water blacking for hot or cold stoves, which is always ready and easily applied. One bottle, it is claimed, will make four when diluted. Circulars will be sent to the stove trade on application.

CONDITION OF THE

Hardware Trade.

TRADE CONTINUES in moderate and diminishing volume, as is expected at this season. Some of the larger houses are covering their requirements for early fall trade, but orders are placed conservatively and not for as large quantities as usual, the policy of keeping near the shore being still quite generally followed. There is a fair though not heavy business from the smaller trade, with many of whom the demand is much more limited than usual, and they are accordingly keeping their stocks down to as low a point as possible. The declines which have occurred in prices during the past year induce a closer adherence to this policy than would be the case if the market had not for a long time been a declining one. Whether the bottom has yet been reached is a question which careful men are canvassing. It is the opinion of many manufacturers that prices in many lines are not at all likely to go lower, and when the reaction comes from the sluggishness of trade, it is considered probable that there will be a strengthening in values, in some lines at least, and a scarcity of some goods is not improbable. It is hoped that the tariff question, the delay in the settlement of which is having so mischievous an influence on business, will be disposed of before long, so that there may be at least an opportunity for a good fall trade.

Advices from Chicago.—Extremely hot weather prevailed all over the West last week, causing an unusually heavy demand for Refrigerators, Window Screens, Screen Doors and other summer goods. The large number of rush orders thus received indicated very forcibly the conservatism with which retail merchants had purchased stocks of such goods in advance of the season. Ordinarily, the demand would have been light for some time after the advent of hot weather, or until first stocks had been run off. Now, however, the demand is thrown at once on the jobbers, which shows that they have been made to carry the stocks. Hand to mouth buying keeps down stocks in retailers' hands below their normal size, and there is no allowance for even a slight increase in local consumption. Other lines of goods in Shelf Hardware are moving in about the same volume as heretofore, orders being small for sorting up, yet fairly numerous. Sales in the aggregate are running about even with last month. Sheet Iron is beginning to move from jobbers' hands at last. They are receiving plenty of inquiries for prices for immediate delivery and are quoting prices for small lots, which are about what manufacturers charged last year. The stove trade is picking up to some extent. Orders are now being booked for fall delivery, and among them are not a few for good sized stocks. Very dry weather has prevailed through the West for the past three or four weeks, causing a great deal of apprehension for the crops now growing, but on Friday and Saturday local rains broke the drouth and prospects have greatly improved.

Notes on Prices.

Wire Nails—There is a perceptible falling off in the volume of business and most of the mills are well up with their orders. Some of them, in view of the summer dullness, are curtailing their production and preparing to close altogether for a few weeks. The price of $1.10 for carload lots at mill is well

maintained. Small lots from store in New York are held at $1.25 to $1.30.

Advices from Chicago.—Manufacturers report trade very quiet. Even inquiries are light. The factories are reducing their output, either getting down to single turn or stopping entirely. Prices are very firm at $1.20 to $1.25, Chicago delivery. The local situation is now much better, as prices have been relieved of their irregularity. Jobbers' large stocks have been worked off, and a uniform rate of $1.25 is quoted on small lots from stock. While the demand from retailers is not heavy, as they are buying merely what they absolutely need, no objections are raised to the payment of this price.

Cut Nails.—The price remains the same as given in our last report, the market being represented by the quotation of 95 cents to $1 for carload lots of Nails delivered on dock in New York. Small lots from store in New York command $1.10 to $1.15. The demand is only moderate. The Western manufacturers are not competing so vigorously for Eastern trade as a short time ago. A number of the mills are preparing to shut down.

Advices from Chicago.—Local manufacturers are in receipt of a good run of orders, which have accumulated to such an extent that they are anxious to resume operations, but are still unable to do so for lack of coal. Prices are unchanged at 90 to 95 cents for 55-cent average. Jobbers quote $1.10 to $1.15 for small lots from stock.

Barb Wire.—The Barb Wire market is quiet and the mills generally have pretty well cleared up their order books. Prices are well maintained on the following basis for Four-Point Galvanized, delivered: Pittsburgh, $2.10; Cleveland, $2.15; Cincinnati or Allentown, $2.30; Chicago or New York, $2.35.

Advices from Chicago. — Dullness now pervades the trade in Fence Wire, but there appears to be no weakness in prices. The last advance made is maintained. Jobbers report a very light movement from stock and continue to quote Galvanized at $2.35 to $2.40 for small lots and $2.20 to $2.25 for carloads.

Sheet Lead, Lead Pipe, &c. —A reduction has been made by the manufacturers of these goods under date June 20, the following revised prices being announced, which are subject to the usual discount of 20 per cent.:

	Cents per lb.
Lead Pipe	5¼
Block Tin Pipe	35
Sheet Lead	6¼
Tin Lined Pipe	15

Cordage.—There is only a moderate demand for Rope, but prices are steadily maintained. The market is largely in the hands of jobbers as the result of the repeated advances, which gives them an opportunity to sell at factory prices. Large lots, f.o.b. factory or New York, are selling at the following quotations, which are subject only to a discount of 1½ per cent. for cash:

	Cents.
Manila, base	7
Sisal, "	5
New Zealand, base	5

Great American Fish Scaler.—Covert's Saddlery Works, Farmer, N. Y., who are putting this article on the market, are selling it to the trade at $1 per dozen net. The Scaler was described in our last issue.

Glass.—The market on American Glass continues to stiffen as the date for the annual closing down of factories approaches. Some factories have been obliged to close on account of lack of fuel, while others have closed because of the hot weather. One of the largest factories in the Pittsburgh district will close next week, a week ahead of the regular date for closing. The demand is reported fair in small quantities, and orders as being numerous. It is understood that Pittsburgh manufacturers are not inclined to accept new orders at 85 per cent. discount, while the New York market is represented by quotations of 80 and 20 per cent. discount for single or double strength Glass in any quantity. Reports indicate that Plate Glass factories are well supplied with orders, and that prices show firmness at quotations of 70 to 70 and 10 per cent. discount, with an advancing tendency.

Trade Notes.

THE CRAIGHEAD MFG. COMPANY are a new concern who have been incorporated to manufacture Lamps and other brass goods at Shelton, Conn. The head of the firm is Horace E. Craighead, late of the Craighead & Kintz Mfg. Company of Ballardville, Mass. The company have taken possession of the Erschell factory, at Shelton, which will be adapted to the new business.

THE ZUCKER, LEVETT & LOEB COMPANY of New York City have been incorporated with a capital of $100,000 to manufacture Polishing Materials, Platers' Supplies and Electrical Apparatus.

THE LAUFMAN TIN PLATE COMPANY of Pittsburgh, Pa., state that they are rolling their plate of best decarbonized steel and guarantee all sheets to double seam. They are at present offering the trade the following brands: Laufman's Apollo, Tip Top, Freeport and Allegheny. Descriptive circulars and prices will be mailed by the company to applicants.

THIS BEING convention week, it is natural to suppose that every one is interested in steam boilers and everything pertaining thereto. On this assumption our patrons will find entertaining reading in the announcement, presented elsewhere in this issue, of William Vanderman of Willimantic, Conn. The pages which he occupies are devoted to the presentation of the line of steam and hot water boilers and hot water damper regulator which he offers for sale. The illustrations represent general and sectional views of the Samson Boilers, the Vanderman Steam or Hot Water Heaters, the Vanderman Triple Flue Boilers and the Vanderman Hot Water Damper Regulator. Mr. Vanderman is well known throughout the trade as a practical heating and sanitary engineer with an experience of 27 years, during 16 of which he has carried on the heating and ventilating business.

THE EXCELSIOR STEEL FURNACE COMPANY, 38 West Monroe street, Chicago, illustrate several kinds of Register Boxes in their advertisement this week. A complete price list of such boxes was published in their last week's advertisement.

THE INSTANTANEOUS WATER HEATING COMPANY, with Eastern office at 838 Broadway, New York, call attention in their advertisement this week to the goods which they manufacture, and state that every heater is guaranteed as represented. They also state that the trade in New York City and vicinity will find it to their advantage to send customers to inspect the line of Instantaneous Water Heaters which they have on exhibition.

Arizona.

That Dawson & Fiske are a new Hardware firm at PHŒNIX.

Florida.

That C. F. Hamblen, ST. AUGUSTINE, has just commenced the erection of a store building adjoining his warehouse which, when completed, will give him about 25,000 square feet of floor space and about 10,000 square feet of shelving.

Georgia.

That the Lowry Hardware Company, ATLANTA, have purchased the Bicycle stock and business of the Nunnally Company.

Illinois.

That G. G. Shearer is about to engage in the Hardware business at MAQUON.

Indiana.

That R. R. Cranmer's Hardware store, at FRANKTON, was destroyed by fire on the 10th inst.

That the Marion Hardware Company, MARION, have been incorporated, with a capital stock of $12,000.

That the safe in the Hardware store of Fishel Bros., HOPE, was blown open and robbed early on the morning of the 12th inst.

Iowa.

That W. D. Rust has recently entered the Hardware business at WEBSTER CITY.

Maine.

That the firm of Stickney & Wiggin, Stove dealers, BELFAST, have been dissolved, Mr. Stickney having bought out his partner. The business will be continued by Mr. Stickney alone.

Minnesota.

That Huntington Bros. are a new Hardware firm at LUVERNE. C. E. and G. L. Huntington are the members of the firm.

That Hunt A. Wyer has purchased the stock of Joseph Helm, Hardware merchant, at RED LAKE FALLS. The price paid was $5000.

That George Wolheter's Hardware store, at ALBERT LEA, was damaged by fire on the 31st ult. to the extent of $1500.

That thieves broke into the Hardware store of Fuller & Denning, PARK RAPIDS, on the 3d inst. and stole about $75 worth of Guns, Revolvers, Knives, &c

New York.

That the Hardware store of E. E Parker, AKRON, was burglarized on the 8th inst.; $100 worth of Knives, Revolvers and Razors were taken.

Ohio.

That burglars visited the Hardware establishment of J. S. Abbott, at 115 South High street, COLUMBUS, on the 11th inst. and carried off about $150 worth of goods.

That C. Smith, formerly with Carter & Huckins, Hardware merchants, of OBERLIN, has removed to Belleville, where he has opened a Hardware store.

South Dakota.

That Booth Bros., MITCHELL, have disposed of their stock of Hardware to W. J. Healey. The new proprietor is referred to as one of the most energetic and capable business men in the vicinity.

Texas.

That Sutton & Sharp's Hardware store, at GEORGETOWN, was robbed on the 30th ult.

That the firm of Ragsdale, McKinney & Co., BONHAM, have sold their Hardware business to Chas. and Frank Davis and James Biggs, who will continue it under the firm name of Chas. Davis & Co.

That W. L. Vicker & Co.'s Hardware store, at WICHITA FALLS, was burglarized on the 5th inst., a lot of Razors and Guns being taken.

Mechanical Ventilation.

This term has been adopted to distinguish ventilation effected by the use of ventilating fan wheels, &c., from that obtained by the direct application of heat to or in ventilating flues. There are two general ways in which the latter is accomplished: A flue may be heated from the outside—an example is a metal ventilating flue run up through a smokestack—or the inside of a flue may be heated by steam or hot water coils or other appliances. In any and all the variations of apparatus employed to effect circulation in flues, except in rare cases where fans, &c., may be driven by water or wind power, heat must be expended to produce the result; and even in such cases the exception is apparent rather than real, since all power derived from natural sources is drawn from stores of energy depending for supply upon the heat of the sun. Strictly and scientifically speaking, therefore, all ventilation is mechanical; that is to say, it involves the production of motion in air currents by the use of previously confined forces, and the store of such forces drawn upon is so generally contained in fuel that the latter need only to be considered in estimating the economy of different systems.

Economy and Efficiency.

But economy cannot alone be a controlling element in any system of ventilation. Efficiency and certainty also demand careful consideration. No matter how cheap any system may be, if it cannot be relied upon to give ample ventilation under all the conditions imposed upon it in its working it remains a defective system. The whole question between what are called "mechanical" and "natural" ventilation simmers down to this: In which of these two methods can a given required degree of efficiency and certainty be obtained with least first cost and current expenditure? Now since the degree of these qualities required for different buildings may and does vary greatly, the answer to the question can be the same only when the requirements are similar. There is no dispute that a system of natural ventilation possessing sufficient certainty and efficiency for average dwellings can be had for less cost than mechanical ventilation. But between the nearly minimum requirements for home ventilation and the maximum demanded for large hospitals and schools there is a long range of intermediate wants; and for those the question must be decided with special reference to each particular set of requirements. It is only in the extreme cases named that the question may be considered as definitely and finally settled.

Heating Calculations.

There exists a certain form of reciprocity, a kind of give and take, in all scientific calculation, and thus in the art of heating we find that as one body gives up its heat another absorbs it, and as heat is transformed into work in the movement of air so is the work done under certain conditions transformed again into heat. The fact that we cannot calculate more accurately the results to be secured by the introduction of some given device or by the mere supply of a given volume of air at a stated temperature, is not due to any lack of direct knowledge of the laws governing the flow of fluids, the transmission of heat and the like, but rather to the important influence of the material, the porosity, the conductivity and the specific heat of building walls, floors, and ceilings. While the data required for accurate calculation may be amplified and greater certainty assured, yet in the nature of things there will always be a great difference existing even in construction by different parties, but under the same specifications; so great, in fact, that absolute accuracy can never be attained, although the approximation may be very close. There is, however, a certain field of calculation in heating work with which every man in the business should be reasonably well acquainted. It is desirable, for instance, to know the volume of the thermal unit, to know how to calculate the increase in temperature of a given volume of air if heated by the condensation of a given weight of steam, to know what is meant by the latent heat of steam and of what importance this latent heat must be in a steam heating system. Even an approximate knowledge regarding the total number of heat units in a pound of good coal and the number required for the evaporation of a pound of water at a given temperature may be of marked service in arming oneself against the declarations of the man with a coal saving compound that according to his figures of water evaporated per pound of coal would make efficiency of the coal somewhat above the maximum of 100 per cent. Doubtless some of the most disastrous failures in the line of heating and ventilation have occurred, not so much through absolute ignorance, as on account of the total disregard of simple and well-known methods of calculation whereby the results of the experiment could have been accurately and definitely determined.

The commencement exercises of the departments of fine arts, domestic science, science and technology (which includes the trade school), commerce, &c., of the Pratt Institute, Brooklyn, were held on Friday evening, June 22. The great hall of the institute was crowded by the graduates and their friends, who listened with attention to excellent and helpful addresses by Mrs. Ellen H. Richards of the Boston Institute of Technology, Hamilton W. Mabie of New York, and Charles M. Pratt, chairman of the Board of Trustees. Mrs. Richards gave a thoughtful address on the American home, speaking of the improved hygienic conditions of the modern home and the great influence of the Pratt Institute in this direction. Mr. Mabie's address was devoted to the subject of education, and the value of a thorough training in life. Diplomas were conferred upon the graduates of the various departments, after which the students held an informal reception in their several class rooms, the trade school building being particularly well filled with visitors, who admired the samples of the work of the 1893-94 classes there displayed.

The *Plumber and Decorator* of London remarks that in the ventilation of churches and school houses and public buildings generally, a very common mistake is made. Those in charge frequently fail to open all the windows immediately after the buildings have been vacated. The exhalations from the lungs and the emanations from the body, being light, will float for a while in the atmosphere before falling to the floor, and if the windows be opened at once, so that a current of air can cross the hall, many of them will be carried out. If, however, as is usually the case, the windows are not opened for some hours, may be not till the next day, these particles, settling upon the floor, are not carried away, but when the hall is again occupied are by the feet thrown up into the atmosphere and inhaled by the lungs, from which they had been exhaled the day before.

THE LETTER BOX.

Water Heating from Low Pressure Steam.

From J. B. C., *New York.*—I would like to know if a low pressure boiler (pressure 10 pounds) such as is used in heating flat houses in this city, could be employed in heating a hot water boiler of 600 gallons capacity, with a coil of one to five, and heat a maximum of 450 gallons per hour, or an average of 250 gallons per hour, or what should be the minimum of pressure of steam to heat such a boiler. I have noticed flat houses having passenger elevator where the hot water boiler was heated with the exhaust of pumps, they having also connection with the live steam, to be used when the passenger elevator was not running. I have also seen exhaust steam used in the heating system of a flat. Please let me know what is the approximate pressure from the average steam pump for passenger elevator.

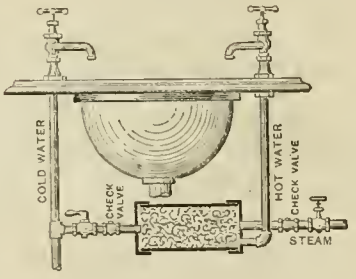
Answer.—Our correspondent's query is so indefinite that in replying to it several assumptions must be made. He does not say whether the steam boiler is to be employed entirely for heating a hot water boiler of the capacity named, or whether it is also to be used for heating the building. In answering his inquiry we shall assume that the heating boiler is required, at least in cold weather, to perform the double duty of heating the building and the amount of water specified. First, the ability of the heating boiler to perform the double duty will depend upon its steaming capacity. Under the assumption that 600 gallons of water are to be heated to a temperature of 212° F., the weight of water to be heated per hour will be 5003 4 pounds. Assuming also that the temperature of this water as fed to the hot water boiler in extreme weather will be 40°, there will be required 860,-584.8 heat units to raise the water to a temperature of 212°. This amount of heat would be obtained by the condensation of 890.6 pounds of steam. To heat 450 gallons would require the condensation of 668 pounds of steam within a small fraction. To heat 250 gallons would require the condensation of 371 pounds of steam. The first named condensation per hour represents the steaming capacity of a 30 horse-power boiler. The second condensation represents the capacity per hour of a 22 horse-power boiler. The third condensation is equal to the amount of steam that could be generated per hour by a 12 horse power boiler. This estimate is based on an evaporative power of 30 pounds of water per horse-power per hour, and the supposition that the water fed to the steam boiler from the returns is not cooled after condensation to a temperature less than 178.5° F. It will be seen that if it should require, say, a 20 horse-power boiler to heat the building, that to heat in addition 250 gallons of water per hour, taken from the mains at a temperature of 40° F., would require a total horse-power of 32. Probably the back pressure in using exhaust steam for heating, whether from steam pumps or other non-condensing engine, will average in good general practice about 4 pounds. Steam exhausted at this pressure is substantially as fit for heating purposes, whether of air space or of water in tanks, as if it were generated in a low pressure boiler expressly for heating. If steam for heating the building and for heating a tank be supplied from a low pressure boiler there is no difficulty in so arranging apparatus as to effect a return of condensed water to the boiler by the action of gravity alone. If the primary boiler be used for the three purposes of supplying power for elevators or dynamos, for heating the building and for heating a tank to supply hot water to occupants, it will be necessary to employ pumps, traps or steam loops to effect the return. The mistake is sometimes made of supposing that because the exhaust from a steam engine can be used advantageously for heating purposes, the same effect could be obtained by drawing steam from the returns of a heating plant. This can only be done by employing a sufficiently large boiler to heat both the building and the tank. Even then it would not be the best way to draw steam from the return main. The correct plan is to take live steam from the boiler or from the steam main for heating the tank, and return the condensed water from the coil in the tank in the same manner as it is returned from the radiators.

Choked Water Backs.

From W. F., *Hoquiam, Wash.*—I have been looking over some of the replies to the inquiry of "E. J. Y.," Regina, N. W. T., that appeared in *The Metal Worker* of May 19, concerning choked water backs, and I find that the one from "E. S. M.," Westminster, Md., in *The Metal Worker* of June 2, very nearly hits the mark. I have had quite an experience with water backs on the Pacific Coast, and in some cases they would choke up in no time, but to overcome the difficulty the only thing required is to construct the water back so that the water circulating through it will not get hot enough to boil. In case of any trouble like that mentioned, I have either increased the size of the pipe used or decreased the number of pipes in the coil, so that the water in the pipes and boiler would never come to a boiling point. This plan fixed the matter for good every time.

A Method of Heating Water.

From T. O. H., *Terra Haute, Ind.*—I send herewith a sketch which shows how hot water was secured at a wash basin in a building in which there was no hot water system. A branch was taken from the pipe that carried cold water to the cold water faucet and run to one end of a chamber, which was filled with pebble stones. At the other end of the chamber two connections were made, one to receive steam, as there was a power plant in the building from which steam at any time could be secured; the other to convey hot water to the hot water faucet at the wash basin. Check valves were placed in the steam pipe and in the cold water pipe



A Method of Heating Water.

on each side of the chamber to prevent water passing down the steam pipe when the steam pressure was not as strong as the water pressure and to prevent the steam from holding the water supply back when the steam pressure was the stronger of the two. The pebble stones were placed in the chamber to prevent the steam making a direct passage to the hot water supply pipe. The satisfaction derived from this arrangement may truly be said to be variable, but is sufficient for the purpose for which it was intended. Thinking that this contrivance might be of interest to the readers of *The Metal Worker* I have sent it in, and have no doubt that many other readers of the paper come across just such interesting novelties in their practice as this, and I trust they will return the favor which I think I am contributing by sending in letters and sketches of what they find.

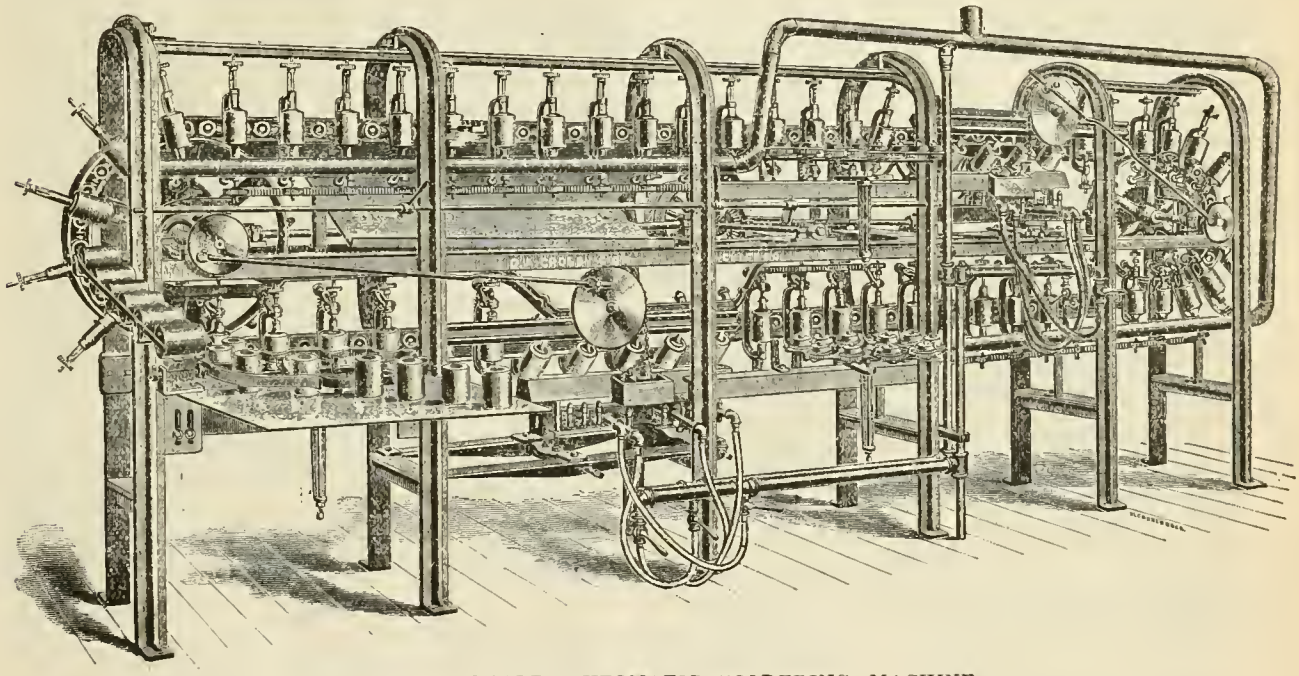
Heating from Furnace Coils.

From CÆSAR, *Louisville.*—The subject of heating from furnace coils is a very difficult one to handle. In regard to coil in a furnace for the heating of one or two rooms at a distance I would say that I have always steered clear of such adjustments whenever and wherever they have bobbed up, for the following reason, which I think will cover a majority of cases: It is impossible to adjust the proper amount of water necessary to the heating of one or two rooms to the body of fuel necessary to heat the balance of the building with-

out constructing a cumbersome and illy balanced job. In cases where it was impossible to reach the rooms with warm air, I resort to the combination plan and heat the lower floor with warm air and the upper floors with hot water or steam. By this plan I obviate all of the trouble resultant from the coil practice. Another reason is that I have never seen a building yet that could not be heated with warm air if the owner would pay the price. A combination can be balanced perfectly and if placed by a competent man the results are always satisfactory. I do not care to enter into an argument on this question, viewing it from the standpoint that I do that the majority of such attempts are failures, and I think that a close investigation will bear me out in the premises.

The Crosby-McDonald Automatic Soldering Machine.

This machine, intended for the use of can manufacturers, is manufactured by G. A. Crosby & Co., 176 and 178 South Clinton street, Chicago. It has been subjected to very thorough and even severe tests, from which it has emerged with most flattering results. An illustration of the machine is presented herewith.



THE CROSBY-McDONALD AUTOMATIC SOLDERING MACHINE.

It is designed to solder both tops and bottoms of round cans on to the bodies, this being accomplished and the can wiped, cooled and automatically discharged from the machine without handling. For heating the solder either gas, gasoline or kerosene may be used as the manufacturer prefers.

The cans are carried by a feeding device from the feeding table to the chucks, where they are automatically centered and clamped. As the chucks containing the cans are carried forward they assume an inclined position, and one end of the can is rolled through a bath of molten solder, the bath being of sufficient length to allow a 3-pound fruit can to be revolved therein about four times. As the can emerges from the bath the carrier brings it again to an upright position and it passes by an automatic wiper, which removes all surplus solder and dross, leaving the metal perfectly clean and bright. The can is then carried past a length of perforated pipe, through which a blast of cold air is forced, causing the solder to cool and set before it passes around the end of the machine, where it is reversed and the other end subjected to exactly the same process as above described, after which the cans are automatically discharged from the machine into whatever receptacle is provided for them.

The cans are revolved from the instant they are clamped in the chucks until they leave the machine, thus allowing the solder to settle evenly and soak well in between the burr of the ends and the bodies. The solder bath is adjustable in all directions so that it may accommodate various hights and diameters of cans. The solder is not melted in the same bath through which the cans revolve, but in an adjoining bath, from whence the molten solder is introduced into the soldering bath by an automatic feed. This insures an even temperature in the soldering bath, as the molten metal is not cooled by the addition of new solder; and, as exactly the same amount is fed in that the cans in their passage take away, the solder is always at the same hight in the bath. Two boys are required to operate the machine, which thus attended will solder the tops and bottoms on to from 35,000 to 40,000 cans in ten hours' time.

The machine is constructed in the best manner. All gears are cut and all wearing surfaces are fitted with the utmost accuracy. Each of the several can carriers runs upon a separate and independent set of trucks, thus reducing friction to a minimum. The machine occupies a floor space 4 x 20 feet and stands 4 feet in hight. The firm state that they have several of these machines in operation in some of the largest packing establishments of the United States.

Prospects in the building trade of Philadelphia appear to be hopeful, if recent reports from that city are reliable. The Philadelphia *Record* announces that Frank H. Rhodes will build 138 houses on Opal and Garnet streets; that John S. Serrill has plans under consideration for the erection of 120 houses on Lehigh avenue; that T. B. Roberts has already started work upon 163 in Twenty-ninth and Master streets, and that James and Charles Maguire have concluded negotiations for a site on which to build 80 dwellings. On the whole, the good building record of 1893 is likely to be eclipsed in the Quaker City this year, if all these plans materialize.

A Boston Passenger Station.

The new Union Passenger Station at Boston of the Fitchburg and Boston & Maine Railroads possesses several noteworthy features, especially in relation to its train shed, and for its heating and lighting system. These are described by a local paper as follows: Twenty-three tracks had to be covered, and to accommodate them a train shed 540 feet long and 472 feet wide has been built. Part of this is an old shed, the new portions consisting of eight spans covering two tracks each, and one span covering a single track. This structure is built of 1500 tons of steel and glass, the latter having an area of nearly 4 acres, and is supported on 128 columns. The lighting and heating apparatus form one of the largest isolated plants in the country. There are 12 125 horse-power boilers, of which six furnish steam at 80 pounds pressure for heating, and six supply the engines with steam at 125 pounds. Instead of building a high chimney, the draft for the boilers is furnished by two powerful steam fans, 11 feet in diameter. Two air compressors for the interlocking apparatus, a number of pumps, five 200 horse-power and one 100 horse-power Westinghouse engines make up the power plant. The electric apparatus comprises two 125-volt, 125 kilowatt generators for operating the draw bridges and turn tables, one 220-volt, 62-kilowatt generator for the electric elevators, one 7½ kilowatt generator to charge the storage batteries for the switches and signals, and two alternating machines for supplying lights at distant points.

A bill to allow cities to furnish electric current for heating has been passed by the Massachusetts House of Representatives.

STEAM AND HOT WATER.

Convention of Master Fitters.

In last week's *Metal Worker* we presented nearly the complete report of the convention of the Master Steam and Hot Water Fitters of the United States. At the time of going to press, however, they were in final session. We present below a note of what was done at the close.

The convention met in executive session shortly after 3 o'clock Friday afternoon, but about 4 o'clock went into open session. It was announced that arrangements had been made for a meeting on July 18 next between a committee of manufacturers of valves and flanges and the chairman of the Committee on Standard Flanges. At this session A. B. Franklin of Boston read a paper on the value of the National Association. A paper was likewise presented by John B. Farnsworth, entitled "Early Reminiscences in Hot Water Heating."

Appropriate resolutions upon the deaths of the following members of the association were adopted, and it was ordered that engrossed copies be sent to the families of the deceased: Herman Kroeschell, Chicago; Hazen Mooers, Milwaukee; J. Lincoln, Jr., Chicago; G. W. Strong, Joliet; William Costello, South Boston.

The convention then adjourned to meet at 9 o'clock Saturday morning, but at this final session nothing was done except that a formal adjournment was taken until the next annual convention.

Types of Heating Boilers in the United States.*

BY ARTHUR C. WALWORTH.

It is not within the scope of a paper of this character and length to enter into history to any great extent, yet it will not be amiss to take a glance backward and notice the development and separation of the several types of heating boilers in use to-day.

In the first half of the century there were few boilers in use for heating purposes only; most of the boilers used for power were of the long two-flue variety, with occasionally a hog nose, a marine or a locomotive boiler, and where steam was used for heating mills, &c., as it sometimes was through large cast iron pipes, it was taken from such boilers. There were, however, a few Perkins coil boilers in use in dwelling houses, which had been introduced by Walworth & Nason between 1840 and 1850, some of which are still in use, and whose type is preserved in the Baker car heater, and there were also some English saddle boilers used in greenhouses, connected to 4-inch cast iron hot water pipes.

AMERICAN INNOVATIONS.

To an increasing demand for steam and water heating, the inventive American mind was quick to respond with improvements and extensions of these primitive appliances: the multitubular horizontal boiler displaced the old two-flue boiler, cast iron was introduced as a material for low pressure boilers, the sectional principle was made prominent as an element of safety, and the thousand and one useful appliances and attachments were devised, so that the approved heating boiler of to day is not only a thing of beauty but an admirable and ingenious piece of mechanism, adapted, so far as human ingenuity can devise, to the peculiar and exacting demands which are constantly made upon it by people who seem to ask nothing short of a thinking and a reasoning automaton.

The system of heating water in a coiled pipe was an attractive one to inventors, and for the last 40 years we find that pipes have been bent and coiled and stacked over, under and around fire boxes in every conceivable manner; box coils, trombones, spirals, gridirons, bird cages and many other forms have been tried; some have worked well and some ill, but those that survive are of the simpler type, the more complex ones having been cast aside, both on account of the mechanical difficulties of their construction and their obstruction to free circulation. For boilers where compression into the smallest bulk is essential or very high pressures are required, this type stands at the head as represented to-day by the Roberts, Almy or Herreshoff boiler. For steam heating apparatus such boilers are not so often required; but for hot water circulators they have a wide field of usefulness from the large amount of surface which can be compressed into the space assigned to a house heater.

At this point it should be stated that since any steam boiler can be used as a hot water boiler, and any hot water boiler may be made a steam boiler by adding a steam drum, I have not separated steam and hot water boilers in the general classification, as that would be an artificial rather than a real distinction.

The use of coil boilers naturally led to the invention of the water tube boiler, which is simply a fire tube boiler with its elements reversed.

Walworth & Nason were making such boilers before 1849, with tubes standing at an angle of about 20° from the horizontal, whether of Mr. Nason's invention or adaptation I do not know.

This type of boiler proved strong and economical, although somewhat expensive, its leading representations to-day being the Babcock & Wilcox, Root, &c. The several makes of water tube boilers came to the front at the Philadelphia exposition of 1876, where careful tests were made of their evaporative capacity with very favorable results, and many of the best house heating boilers to-day are built upon their lines.

Horizontal water tubes suggested vertical water tubes, and this type to day is possibly the most popular for house heating boilers, of which there are many exemplars, both with open tubes and drop tubes, which will be considered later under their respective headings.

THE SADDLE BOILER.

One of the most prolific parent types was the English saddle boiler mentioned above: this was a welded wrought iron boiler, shaped like an inverted U or saddle, with a grate under it. This boiler was often used in greenhouses, and was so wasteful of fuel that a brick or tile flue was usually carried the whole length of the house under the cutting bench to utilize the waste heat. Our American boiler men substituted cast iron for wrought iron, closed in the ends, put a fire door in the front, and we had an old fashioned greenhouse boiler. This was still wasteful of fuel owing to its small fire surface, and improvements were made by using extended surface, corrugations or ribs on the inside, and also by adding internal smoke flues, down drafts, and other devices until this type of boiler has been made most useful for hot water apparatus not under head; these boilers I have classified as fire box tanks.

Another form of fire box tank was evolved from the tea kettle, by raising the fire up into the center of the kettle: to these again internal surface was added for the sake of economy either by extended surface as by Scollay, or by internal water boxes as by Weathered, or by a coil as by Mahony. This class of boiler is simple, cheap and useful for small dwellings, greenhouses, baptisteries, &c., and is often used in its simplest form of a ring of water around a fire pot, making what is usually called a fire box stove.

CAST IRON BOILERS.

From the water tube boiler was evolved in easy sequence the cast iron sectional safety boiler. In using a material like cast iron for a boiler it was evident that for purposes of safety each boiler must be subdivided into a series of small units. Geo. B. Brayton of Providence, R. I.—so he wrote to John H. Mills—made a cast iron sectional boiler, bolted together with faced joints, at Westerly, R. I., in 1849, but it was 1864 before the type was practically introduced, this boiler being apparently the pioneer of the numerous horizontal cast iron boilers with vertical strata. In 1859 Mr. Gold patented a boiler of this kind bound together with three string bolts. A suit brought by H. B. Smith & Co. against J. A. Ingalls & Co. (now Ingalls & Kendricken) throws some light on the history of this kind of string bolt boiler. The defendants were the successors of T. S. Clogston & Co., and were making the Clogston boiler, a cast iron string bolter. They proved in court that Joseph Nason was making in 1855 a cast iron boiler with short horizontal water tubes entering a vertical tube for each section, and the sections being united into a boiler by a string bolt through a water ring at the ends of the vertical tubes. They also proved from the French patent records that one Onesiphore Pecquer patented in France a boiler of this type in 1825. As a result they gained their suit, and the string bolt sectional boiler was open to the world.

Some time before this the Exeter Machine Works had bought Brayton's patterns and patents, and were making the so-called Exeter boiler, which still maintains its high reputation in this group.

In 1870 E. C. Clay of Boston devised a cast iron sectional boiler for dwellings and greenhouses, using instead of faced surfaces two horizontal drums to which the sections were connected by lock nut nipples, and it was at this time also that Mr. Mills was developing his boiler at Walworth's foundry at Cambridgeport, Mass. He also adopted the lock nut screwed connection after discarding the faced joint and the right and left nipple, being the first, I think, to use it in this kind of boiler. It proved popular and was adopted by the Exeter people, J. A. Ingalls & Co., H. B. Smith & Co. and others for large boilers of this type.

Sectional boilers with vertical sections readily suggested vertical boilers with horizontal sections, originating the cheese cake style of boiler, which has been made in such large numbers and seems to be the predominant type of small house boiler.

In 1874 the Canadians were using a great deal of hot water apparatus and importing many English boilers, and this naturally caused them to invent and build boilers of their own, which proved better than the imported ones. About this time Rogers & King of Moutreal began to build the Spence, a square layer boiler named after the foreman. Mr. Gurney of Toronto, a stove founder of business capacity and ability, was the first to improve and push these buckwheat cake heaters as a commercial enterprise, and by combining a good heater with judicious advertising, he has placed thousands of them throughout the United States. They seem to be an evolution of the square Stafford and Spence heaters above mentioned. These pancake boilers are, like their horizontal cousins, either string bolted, like the Gurney, or nippled, like the New Winchester and Hub, and their name is legion.

* Presented at the New York Convention of the Master Steam and Hot Water Fitters' Association of the United States, June 19-21, 1894.

BOILER CATALOGUES.

Most makers of house boilers issue well gotten up circulars or pamphlets describing their boilers in detail. These are sometimes elaborate and handsome books with cuts of boilers, both assembled and detached. If complete they give tables of the data of the different sized boilers, such as number and size of tubes, outside dimensions of boiler, size of smoke pipe, tapping of outlets, square feet of grate and amount of boiler surface. Also a column of number of square feet of direct or indirect surface that the boiler is supposed to carry—that is, the rating of the boiler. In the competition of an open market this is inevitably high, as the maker must rate his boiler as his competitors do theirs—at what it can do and not at its duty under every day average and sometimes unfavorable conditions. The safest way for the heating engineer to determine the size he needs is to estimate the amount of water his apparatus will condense per hour, the only true gauge of its requirements, and allow 1 square foot of grate for every 60 pounds of water condensed per hour, which means a coal consumption of 6 to 8 pounds per hour. And for good economy I claim that a boiler should have not less than 35 square feet of boiler surface for each foot of grate surface, and this surface should be real and not nominal. The above ratings will give from 170 to 200 square feet of direct surface per square foot of grate, but for boilers of larger size this will be of course a larger figure, but depending invariably on the evaporative power of the boiler. I find that hot water boilers are more apt to be overrated than steam, as there is no standard temperature for hot water apparatus. I myself prefer a boiler that can carry the water to 212° or higher, and this means very nearly a steam rating, and in any case I do not think a hot water boiler should be rated more than 25 or 30 per cent. higher than the same size used for steam, yet 50 per cent. is perhaps the more common practice.

BOILER CLASSIFICATION.

I submit herewith a classification of the various boilers and types, genera, species and sub-species, from which, if it were worth while, a table of analysis could be made from the appended boiler lists, so that a person finding a boiler without a name could analyze it and bring it home to its maker in a few minutes. Of course some boilers are hard to place, as they are crosses between two species, like a mule, and my placing them in a certain category may be questioned, but I have arranged the boilers according to their salient points, and submit my lists as the first classification made so far as I am aware.

Analysis Table of Heating Boilers.

						Example.
The original tea kettle	Water subdivided..	Direct passages.....	Water tubes.....	Horizontal.....	Ends of tubes closed	Nason
					Ends of tubes open	Root
				Vertical.....	Open tubes	Mouat
					Drop tubes	Furman
			Cast iron, variform	Horizontal boilers....	Packed joints	Gold
					Screwed joints	Clogston
				Vertical.....	Packed joints	Gurney
					Screwed joints	Hub
		Serpentine passages			Bent coils	Baker heater
					Coils made with fittings	Garth
	Smoke subdivided..	Horizontal tubular			Tubes in one series	Allen
					Tubes in several series	Vogt
		Vertical tubular....			Tubes in one series	Regular
					Tubes in several series	G. K. Paul
		Locomotive				Monarch
	Water and smoke massed	Single.....	Fire box tubes.....		Plain surface	Crawford
					Added surface	Hitchings
			Water stoves			Little Giant
		Complex.....			Concentric rings	Pequot
					Cylinders with loops	Steads

WATER TUBE BOILERS.

Taking the boilers in the order of the analysis we have, first, the horizontal water tube boilers. The high economy of these boilers arises from the large amount of surface that can be placed in a given space by using a square or rectangle instead of a circle, and the element of safety becomes more important as modern engineering demands higher and higher initial pressures. For steam heating this point is not essential, but this kind of boiler has been adopted by the New York Heating Company for their central stations, where they supply steam for both heating and power. In all water tube boilers the weight of water is small in proportion to the duty; and this is advantageous, or the contrary, according to conditions. The hight required for setting these boilers often forbids their use as heating boilers, where they must be placed in basements; and their surfaces are not so easily kept clean as those of the ordinary tubular boiler, as it is evident that the inside of a tube is more easily brushed or blown clean than the outside.

The vertical water tube boilers have the same advantages as the horizontal, with the additional one of not accumulating soot and ashes on their tubes by gravity. In order to be economical, however, some of these boilers, like the Firmenich, require a great hight to obtain a proper length of tube. The drop flue boilers seem to be the best adapted of the vertical water tubes for small heating apparatus, and in the last few years this style has been adopted by many makers, some of them changing from other forms. They permit the concentration of a large amount of surface directly over the fire, and the tubes may be termed self cleaning, as an occasional brushing removes the few ashes that adhere to the vertical surface. The principle is an old one for steam boilers, and Mr. Nason made small house boilers on this plan before 1870. It has been claimed that drop flues will not circulate freely and will collect sediment. But practice shows that this objection is not valid. The Silsby Mfg. Company, who have made drop flue steam boilers for many years, write to the Bolton Heating Company that there is no trouble about rapid circulation, and that the tubes ought to last 20 years or more in a house boiler. As the circulation will take lead shot out of the bottom of the tube there is no danger of sediment collecting, and the makers of the Button boiler tell me that they find the bottom of their loops actually polished on the inside by the rapid current. A disadvantage of these boilers is that they are not easily emptied of water, but this is an infrequent demand, as heating boilers in summer should be filled to the safety valve rather than emptied.

CAST IRON BOILERS.

Next in order come the cast iron boilers. Cast iron is not a material that commends itself to the mechanical engineer for boilers, since in them all strains are those of extension, which cast iron is comparatively weak to resist. American ingenuity has evolved notwithstanding, by the use of this material, a large class of boilers which have been especially successful for steam heating purposes where high pressures are not essential, while by subdividing spaces and using proper thickness of metal they are made safe against explosion and not especially liable to break down. The use of castings instead of sheet metal or tubes enables the maker to depart from rectilinear forms and employs every combination of curves, arches, spheres, bends and corrugations, resulting in an almost infinite variety of detail, some good and some bad.

The horizontal boilers have been most popular for plants of 10 to 50 horse-power, and the vertical or smaller ones of 1 to 15 horse-power. The horizontal may be subdivided into the screwed connections and packed connections, either of which is good, if well made. These sectional boilers can be carried piecemeal into many places where a boiler in one piece could not be got; they also help out the heating engineer when he is short of length but has plenty of width. Almost all these boilers are short of steam space and liable to lift water if forced beyond their fair rating, but for hot water boilers they are especially useful, as their vertical circulation aids the circulation of the apparatus and their life is apparently longer than that of a wrought iron hot water boiler.

All boilers of this class need especial care in cleaning; they are full of corners and pockets where soot and ashes collect, and are with difficulty swept clean either with a brush or a steam jet. It may also be added that a freeze is sure destruction to any cast iron boiler.

Much of the above applies to the cheese cake cast iron boilers with horizontal sections. These boilers are usually provided with cleaning doors for spaces between layers, which must be constantly used, as each layer is a flat shelf for dust to collect upon. Fortunately by using numerous layers these boilers obtain a large amount of bottom and vertical surface, and do not depend on this shelf surface, which is apparently of little value unless swept every day.

Almost all these boilers would gain by using more sections, thus increasing the ratio of surface to grate but without increasing in proportion the cost of the boilers. Most of these boilers have water fire boxes, which is an essential point for a house boiler, as when a fire is covered up for the night and the drafts closed it gives out little heat, except radially in a horizontal direction. In order not to dull the fire at the edges they also have usually fire brick lining or alternate fire brick and iron. Some of these boilers are without outside jackets of non-conducting material and would be improved by such addition.

COIL BOILERS.

There are two conditions that lead an engineer to seek a coil boiler. One is where he needs a strong, light, small and simple affair, and can use a circular or conical coil like a Baker heater, and the other is where he is assigned neither length, width, nor hight and must pack many hundred feet of boiler surface into a few cubic feet; then he can use to advantage, as in some office building where basement space is worth $100 a square foot, a boiler like the Perkins or Almy. Of course such boilers must have steam separating space and enough of it, or they will lift water with great facility; neither can they be used except with pure or purified water, as a small amount of scale will destroy them. They are, however, economical of fuel and perfectly safe, being, as stated before, adaptable to the lightest pressures demanded in steam engineering. They should be run by an experienced fireman, with his eye on the water line, for the lower tubes once emptied they become red hot and bulge down into the fire box in a very few minutes.

TUBULAR AND OTHER BOILERS.

Next comes the old, reliable multitubular horizontal boiler, whose merits and weaknesses, whatever they are, are known to every engineer, and for all around heating plants it is to-day the most popular boiler made and I think justly so. It is of strong form, low cost, easily cleaned, easily repaired by any boiler maker, is loaded with no patent royalties, and when it blows up goes "all at once and no part first." I

do not think, however, that there is a case on record where such a boiler, being used for heating purposes and the main supply valve kept open, has exploded. With a properly proportioned apparatus you will find it very difficult to get up over 15 pounds steam pressure on the gauge, while with 80,000 pounds tensile strength steel a 48-inch boiler with ⅜-inch shell figures 1250 pounds per square inch bursting pressure, or using 5 for factor of safety 250 pounds, which would seem a safe margin beyond all peradventure.

The regular vertical tubular boiler is not much used as a heating boiler, one great objection being that its vertical tubes are not easily brushed either from the fire box or from the smoke bonnet; nor are such boilers economical, owing to the short length of tube that is submerged, usually only five-eighths of the whole length. They also have a very hot smoke bonnet when forced and have often set on fire the ceiling over them where it has not been fire proofed. This type has been modified, however, and, the above objections being removed, makes an excellent house boiler. Mr. LeBosquet obviated the latter objection by adding a superheating chamber over the tubes and under the bonnet, and J. K. Paul and others have added more surface by additional tubes with reversed draft and by other devices, so that the boiler has been made as economical as others of its class and cost. A very simple and fairly good boiler with vertical tubes is made by a plain cylinder full of tubes set on end on a brick fire box, and if brick setting is also used the outside skin of the boiler may be utilized for boiler surface; this boiler is hard to beat for low cost.

Locomotive boilers are not much used for steam heating. They are rather too expensive, for one thing. They are, however, a first-class boiler in a wood burning region, perhaps the best adapted to burning wood of any of the types. The writer has also used them in large dwelling houses in Maine and New Hampshire, setting the whole boiler under the heating stack and utilizing the outside as heating surface, the same as the Gold boiler is often used.

The fire box tank—that is, a fire box in the inside of a water box—is mostly used for greenhouse boilers where the head of water is only a few feet, as a cast iron box is not a safe thing to put internal pressure on. It is safe to say that these boilers are not economical unless additional heating surface is obtained by various devices, and the makers recognize this fact by making such additions, yet the best of them do not have a proper proportion of surface per square foot of grate. In their simplest form as a water stove they are very useful for laundries, stables, &c., but these little stoves can hardly be considered heating boilers.

The serious defect about all these boilers is that the main body is all one casting, and a small crack or defect when developed destroys the entire boiler.

There are two other types of boilers that should be mentioned before closing the list. One has alternate concentric rings of water and of smoke, and is really a vertical tubular boiler, the shell itself being one large tube and the other tubes being concentric inside it. If made of cast iron this would seem to be a weak form of construction, but will answer if shells are made thick enough. The other peculiar type is a vertical cylinder with surface added by water tubes leaving the cylinder and returning to it either by rectangles, by short loops or long coils. These boilers seem to reverse the usual principle of putting the fire inside the boiler and put the boiler inside the fire. To be economical it is evident that the outside must be very thoroughly insulated with a non-conducting covering.

BOILER ATTACHMENTS.

Leaving the boilers with this sketchy analysis, we should consider before closing their appendages and attachments. The most important of these is the grate.

A vast amount of ingenuity and invention has been expended upon the grates of the house heating boilers, and the manufacturers have profited by the experience of the furnace makers, which is often their own, and produced a large variety of oscillating, rocking, shaking, vibrating, dumping, revolving, and otherwise performing grates which would seem to leave little to be added in that direction. So, too, many boilers have clinker doors just above the grate, which are very useful. The makers universally furnish a water gauge and two or three gauge cocks, and usually a gauge cock box or water cock column, a steam gauge and a diaphragm regulator for controlling the draft, usually arranged to open and close dampers, both at ash pit and chimney, or to open and check draft in latter. For this top smoke connection I am inclined to think that a damper set by hand with a check draft operated by the automatic regulator the best combination. Hot water boilers do not carry with them an automatic regulator, but there are a number of good devices to be found in the market if demanded. A hot water boiler, however, is so different in its action from a steam boiler that it can be satisfactorily regulated without an automatic attachment.

A most marked improvement has been made in the last ten years in the external style and decoration of small boilers. As an example, ten years ago the Gurney was homely enough to scare a mule and its *confrères* were not much ahead of it in beauty. To-day, by the aid of tasteful pattern making, decorative handles, dampers and attachments and a little nickel plate and fresh paint, the house boiler captivates the purchaser at first sight, while artist and poet have been called in to ply their pencil and pen for the advertising literature of the enterprising makers. So have the dictionary and gazetteer been searched for catching appellatives for these children of American ingenuity, and captious must be the man or woman who, disregarding everything else, cannot find a name to suit them. A man can break himself with a Brake boiler or get broke with a Broke, or instead of a mother-in-law he can have a Torrent, a Geyser or a Cyclone in his house; so he can choose between the climates of the Equator, the Tropics, Bermuda, Cuba, Florida, the Gulf Stream or Hecla. If a sun worshiper he can select the Sun, the Sunray, the Soleil or the Torrid Sunshine. If a monarchist he can have a Majestic, a Monarch, or a Royal Palace King and Prince Royal, while an enthusiastic American can buy a National, American, Columbia or Commonwealth, while the sporty man can keep a Champion, Victor or Mascot in the house. At any rate, any one can have both Comfort and Perfection if he so wish.

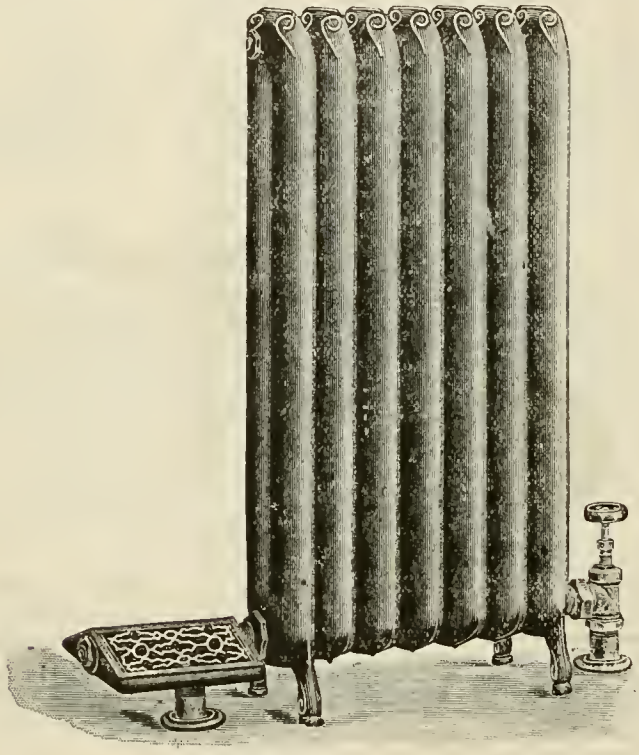
Leaving out the quotation marks this last statement is not far from true to-day, and the American house boiler takes its place by the side of those other necessities of our civilization, the harvester, the sewing machine and the typewriter, as the tribute of American brains to the comfort and convenience of our civilization.

"HEALTH and Comfort in the Home Circle" is the captivating title of a pamphlet just brought out by Thomas W. Weathered's Sons, 244 Canal street, New York. The pamphlet is of oblong shape bound in paper and in a prefatory note dated June, 1894, the company thank their patrons for the favors extended heretofore, and advise them that the Weathered boiler will always be reliable and that they will guarantee it to do all that is claimed for it. On opening the catalogue proper there are found illustrations, general and sectional, of the various boilers made by this well-known concern. First is the double dome, then come their No. 2 and 3 improved boilers. Later illustrations are given of the grates of the single dome boilers and of their self-feed hot water boilers; also their No. 2 combination laundry range. Other illustrations show the method of heating

water for baths, and accompanying the illustrations are given full descriptions and particulars. At the end of the pamphlet are presented a number of flattering testimonials.

The America Foot Warmer.

In the accompanying illustration we show the application of what is known as the America Foot Warmer to a steam or hot water radiator. The foot warmer is being introduced to the trade by the America Heating Company of Rockford, Ill., who state that the device is inexpensive, occupies but little space, is easily attached to a new or an old apparatus and may be connected to either end of a radiator. When used with a steam radiator having a single pipe system the warmer may be attached to the unconnected end, a stand resting on the floor supporting the foot warmer from beneath. The goods are finished in several styles, including nickel plate, brass, copper or oxidized copper. The warmer measures 8¼ inches in length and 9 inches in width. The engraving which we present herewith so clearly shows the device that extended description would seem to be unnecessary.



The America Foot Warmer Applied to a Radiator.

HEATING NOTES.

The Novelty Steam Generator is set forth in a circular issued by the Model Heating Company, Philadelphia, Pa. A general view of the heater and views of the various sections and parts are shown in half tone engravings. A brief description of its chief features is presented, and some facts given of a test held May 29, according to which the boiler evaporated 13$\frac{3}{4}$ pounds of water per pound of coal. Another point made for the boiler is that with 800° of temperature in the fire chamber the smoke pipe showed but 190°. The trade will be interested in this apparatus.

Application has been made for a charter of incorporation for the McGinniss-Smith Company of Pittsburgh, which concern propose to manufacture and sell all kinds of steam, hot water and air heating apparatus and ventilating appliances. Wm. K. McGinniss, Robert S. Smith, Jno. A. Langdon and others are the incorporators. The new corporation will succeed the present firm of McGinniss, Smith & Co.

A Western edition of their catalogue of Boynton's furnaces and heaters has been issued by the Boynton Furnace Company, 207 and 209 Water street, New York, and 195 and 197 Lake street, Chicago. This catalogue comprises 32 pages and treats of Boynton's patent hot water house warming heater, in 17 sizes, for burning hard or soft coal or wood; Boynton's patent cast iron low pressure steam heater, in 14 sizes, also for any kind of fuel; Boynton's new gas tight self-clearing hot air furnace, in five sizes, portable or brick set, for hard or soft coal, with cast iron return flue radiators and with heavy steel plate radiator; the New Climax furnace, for soft coal, in five sizes for brick work, and seven sizes portable; the new steel dome furnace, for either hard or soft coal or wood, in five sizes for brick work and seven sizes portable; the new steel dome return flue furnace with cast fire pot and cast radiator or brick lined fire pot and wrought radiator, for any kind of fuel, in three sizes for brick work and four sizes portable; the New Crusader furnace with heavy wrought radiator or cast iron radiator, for hard and soft coal, in four sizes for brick work and seven sizes portable; the New Niagara furnace with wrought or cast iron radiator, for hard and soft coal, in four sizes; the New Champion wood burning furnace, with 5-foot fire chambers, in four sizes; the Champion Extra wood burning furnace in three sizes; the new steel dome return flue furnace, with water heating combination, for hard or soft coal and easily adapted to wood, in three sizes for brick work and four sizes portable; the New Crusader furnace, with water heating combination, for hard or soft coal, in four sizes; Boynton's Superb fire place heater; Boynton's Baltimore fire place heater; the New Crusader room heater; the Fire King air circulating room heater; Boynton's Newport range in three sizes; the New Danube double oven range in two sizes; the New Lakewood double oven range, and Boynton's Niagara water heater for hard or soft coal or natural gas, in two sizes, for supplying hot water and heating conservatories, small dwellings, &c. The company have also issued a supplementary circular descriptive of their New Niagara low pressure steam boiler, furnished in three sizes.

The Bridgeport Steam Heating Company, Bridgeport, Conn., have increased their capital stock from $10,000 to $20,000.

The Richmond Stove Company, Norwich, Conn., display their usual good taste in the latest catalogue that we have received from them. It is a pamphlet 10 x 8 inches in size, held together by a silk ribbon. The contents are illustrations of the extensive line of Richmond heaters made by this concern, with the names and capacities of the heaters given in connection with the illustrations.

Cost of Electricity.

The *Electrical World* states that in referring recently to some English data on the cost of generating electrical energy in central stations the conclusion was drawn that 6 cents would probably more nearly represent, exclusive of capital charges, the cost per horse-power hour of generating current in the central stations of this country than 4 cents, the figure usually quoted. Commenting upon the report of the Massachusetts Board of Gas and Electric Light Commissioners for 1893, our contemporary says:

Extensive official data and information are given of all the central stations in that State, and while not in a form to be directly applicable to calculations on the entire cost of generating current, yet they will enable approximate results to be arrived at. Almost all of the companies in the State do both arc and incandescent lighting, and some also supply current for motors, which renders it difficult to fix on a rate which will represent the average cost at which electrical energy is sold. The charge for incandescent lighting is almost uniformly 1 cent per 16 c.-p. lamp hour, and it is probable that, as usual, where flat rates are given, they are based upon the same figure; assuming that the prices received for arc current are also based upon incandescent charges, we have 12 cents as the approximate price received per hourly horse-power. This figure would be too high for motor rates, but as that assumed for arc light charges is probably too low in many instances on account of the "scaling down" of current for public arcs, we may assume 12 cents per hourly horse-power as the average received for all electrical energy sold, which, however, will include carbons for arcs and trimming. In looking over the result of the operation of the various stations for the year ending June 30, 1893, we find that of 60 companies 26 did not declare any dividend and six did not earn expenses. Of the 28 companies which paid dividends, 19 paid from 6 to 8½ per cent., the remaining nine paying from 5 to 1 per cent. It will be thus seen that over half of the central stations of Massachusetts found no profit in operating, or, under our assumption, it cost them 12 cents or more to generate an electrical horse-power.

PLUMBING and GAS FITTING.

Philadelphia Trades School Commencement.

On Wednesday evening, June 20, the fourth annual commencement exercises of the Master Builders' Mechanical Trades School were held at the Master Builders' Exchange, Seventh street, Philadelphia. The exhibition rooms of the exchange were lighted up for the inspection of the visitors and the exterior of the building was tastefully decorated in honor of the occasion. The programme was simple, consisting of brief addresses by Franklin M Harris, president of the exchange; George Watson, chairman of the Trades School Committee, and Stacy Reeves, representing the school. Director of Public Works James N. Windrim then addressed the students in an effective speech, in which he said that the time had now passed when America was compelled to draw upon England, France and Germany for their skilled artisans. The American youth, he said, have now learned how to work, which is the best capital for a young man. He has knowledge which cannot be lost in speculation, which will increase to the exact value the workman himself puts upon it. Therefore, he continued, every young artisan should set himself a high standard of excellence in his work. His aim should be to be the first in his chosen occupation, to be the best workman, to be a master workman. He rejoiced that the trades schools of America, under the guidance and teaching of skilled men, are providing workmen from our own people who will be able to compete with the highest skill of the nations of the world.

Following the addresses, the graduates of the several classes were presented with their certificates. The numbers graduating from the different classes were as follows:

Carpentry	14
Bricklaying	6
Stone cutting	2
Blacksmithing	2
Painting	3
Plumbing	19

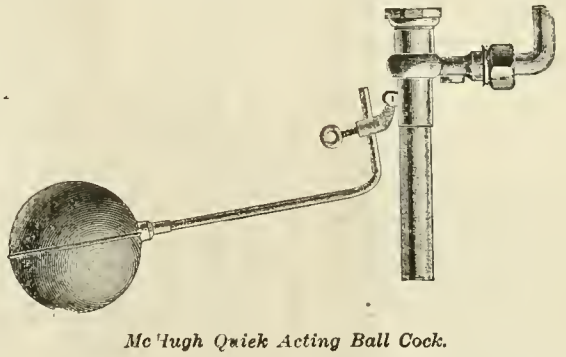
The following are the names of the students who graduated from the plumbing class:

George H. Broehnan.
Claude Ramsbacher, Jr.
William E. Daniell.
Ellis Swann.
Edmund A. A. Schneider.
Thomas Hushen.
James J. O'Hara.
Edmund J. Reidel.
John W. Butler.
George Worrell.
S. J. McCandless.
James S. Ferguson.
John J. Schwartz.
John M. Stemmer.
George W. Duffy.
Thomas J. Malarkey.
Lawrence Hatch.
Samuel E. Draves.
William A. Roberts.

Of these graduates, George H. Broehnan and Claude Ramsbacher, Jr., received prizes of $10 each for special proficiency. The school will commence its fifth session in the fall, when a large attendance of pupils is assured. Its success so far has been remarkable. Graduates from the various branches of trade taught have almost without exception obtained remunerative positions, in which they have done great credit to the training received in the trades school.

McHugh Quick Acting Ball Cock.

The accompanying engraving represents the McHugh quick acting ball cock, recently patented, manufactured by T. J. McHugh, 292 Washington street, Boston, Mass. The device is made of best material and so constructed as to admit a free flow of water when open and to close quickly and tightly by the action of the ball. It gives a full supply until the tank is filled and shuts off, without dribbling or hammering. The manufacturer states that there is no packing to wear out or dry up when water is shut off.



McHugh Quick Acting Ball Cock.

The Knights Initiate.

The Knights of Tabasco assembled in the "ordinary" of the Cadillac on Thursday afternoon to perform their initiating ceremonies. In view of the large number of new members, nearly 100, the following were selected to be initiated in the presence of the rest: Samuel Clark, A. C. Whitney, W. J. B. Lee, J. H. Hamilton, C. H. Meckenbirn and Frank K. Chew of *The Metal Worker* staff.

While the Knights were working on the first candidate, the others, by courtesy of a chambermaid, were released from their confinement in an adjacent room and entered the sanctorum wearing Ideal water closet seats around their necks for regalia. They were quickly secured, ordered to be killed, and confined under guard. The sentence of death was afterward commuted by "Old Pepper" Cushing to an initiation of unparalleled severity, and the good work went on. The "hot stuff" applied approached the temperature of the furnace through which Daniel passed, and every man came out a genuine "hot stuff." "Red and White Pepper" (the secretary) then reported $100 in the "pepper pot" (treasury). Judge C. B. Ernst was then elected attorney extraordinary and counselor plenipotentiary, his salary to be drawn from his own bank account. Resolutions of thanks were adopted to the Hotel Cadillac for the courtesies received; to A. G. Alexander for his splendid entertainment and to the National Association of Master Plumbers for the honors conferred. "Young Pepper" D M. Davidson and "Pepper" F. W. Herendeen were appointed a committee to send to each copies of the resolutions. The meeting then adjourned and the Knights dispersed, singing one of their quaint songs. This unique organization will be heard from in greater strength than ever at Philadelphia next year.

Detroit Manufacturers.

The manufacture of goods that are used by plumbers is an industry in Detroit, Mich., in which a large number of people are employed. A few of those on whom a call was made during the convention are given below.

The Park & McKay Company make a specialty of plumbers' supplies and manufacture a number of specialties, their Utopia siphon water closet being one of their leaders.

The Detroit Lead Pipe & Sheet Lead Works, Detroit, manufacture all weights and sizes of lead and tin pipe and sheet lead. In addition they handle a full line of wrought iron pipe and valves and fittings. They also carry plumbers' tools and supplies and are adding a number of specialties that will interest the plumbers.

The Detroit Sanitary Supply Company, Detroit, Mich., are sending out a neat catalogue of their Clean Sweep non-siphon trap in brass, vented and unvented, in all of the various shapes required for sinks, lavatories, baths and urinals. The same variety is made in lead cast in one piece. They also make a large line of Clean Sweep bath and basin waste and overflow and supply pipes with air chambers. They also make a combined basin overflow and plug combined. Goods made to measurement are one of the features of their business.

Birck & Sherwood Mfg. Company are well known to the trade through their Success seats and tanks for water closets. Their buildings are on the corner of Champlain and Meldrum streets, and form three sides of a square fronting 200 feet on Champlain street and running back 140 feet, with an average width of 50 feet. Inside the square is

their iron and brass foundry, where everything from the hinges for the seats to the brackets for the tanks are made and a line of plunger water closets. Their wood working department occupies the main buildings, with their brass finishing shop. Here is their sheet metal shop, and 300 flush tanks a day, all finished complete, varnished and ready for shipment, gives some idea of their capacity for manufacturing, and seats are turned out with the same rapidity. The quality of their goods is their pride, and nothing inferior in grade is permitted to be shipped. During the convention a lunch was served to the visiting ladies, and afterward a photograph was taken of the ladies arranged on a specially built platform in front of their factory. All of the ladies left their address and will receive pictures later. The Knights of Tabasco also were entertained, and enlivened their visit with recitations and songs. Many of the delegates found time also to visit this hospitable house.

Sales Bros. are a popular house with the local plumbers who need steam fitters' supplies and soil pipe.

The Ideal Mfg. Company, who furnished a reserved seat for all at the Cadillac, have a plant occupying a front of 350 feet in Dubois street and 230 feet on Franklin. Their wood working shops where the Ideal closet seats, flush tanks and bath rims are made, are so arranged that the lumber passes from hand to hand without resting till it reaches the storeroom with a finish like a fine piano. This wood work is protected by a varnish that is so durable that it is said the seats may be suspended in boiling water for 60 seconds without opening a joint. They have an iron foundry with a capacity of 20 tons of iron per day, where they make all their brackets and cast iron goods and steam and hot water boilers for two of their customers. Their core oven is heated by a gasoline burner made by the Union Heater Supply Company and they are much pleased with its economy and efficiency. Their foundry is fitted up with a railway crane that can be used on any floor in the shop. They have a brass foundry where their brass work and the Ideal hot water and steam valves are made. Their engine room is kept in exhibition condition by their master mechanic who runs the plant which furnishes electricity for their lighting and the motors for the various machinery in their plant.

The Union Heater Supply Company make a specialty of gasoline goods. A plumbers' or painters' torch is one of their new things that presents advantages and can be moved quickly without danger of its going out. They make a furnace for melting brass, in which 4 pounds of brass can be melted in ten minutes ; and as it is small, it is adapted for use in pattern and machine shops. Their first catalogue is being prepared and will contain many excellent articles, one of which is a tailors' goose, the heat of which can be nicely regulated.

Samuel Dickson, 79 East Congress street, has a sample room fitted up with plumbing goods that is calculated to make the Detroit property holder wish for similar fixtures in his buildings. Enameled baths, handsome lavatories and a variety of water closets are set for inspection just as they would be in use.

Bowerman & Allen, 141 West Larned street, Detroit, have a number of attractive specialties which they showed to the visiting plumbers.

Method of House Drainage, Disposal of Waste and Ventilation.*

The subject of house drainage has, since a remote day, been the study of not only the master plumbers, but of scientists, architects, engineers and a host of others, resulting in many divergent opinions of more or less practical utility, but of as yet no perfect system meeting fully the great and ever increasing demands which its importance requires.

To the masters plumbers, equally as much or perhaps to a greater extent, is due a large share of the present excellence of our system now in vogue, and probably it is safe to say that nowhere in our broad land has it been exceeded in its present state of perfection than in the "heart of the commonwealth of Massachusetts." Let us for this then give thanks to the master plumber whose earnest endeavors have carried the good work onward in spite of short-sighted opposition which he has met upon every hand ; opposition coming from those whose efforts should have been directed in assisting rather than in opposing.

But to-day, as a triumph to the master plumber, these same parties are being brought to realize that the master plumber is a power, a factor toward the accomplishment of a perfect whole, and he is beginning to receive his due The difficulty of covering so broad a field as the subject demands in so confined a space as this article is, of course, appreciated, but a few words denoting the progress of sanitary house drainage as at present being introduced here may be of interest.

METHODS OF SEWAGE DISPOSAL.

A city of nearly 100,000 inhabitants must of necessity have a very good, bad or indifferent method of sewage disposal. Worcester is especially favored in the former respect, thanks to our far-seeing city fathers, who have designed, planned and executed one of the finest systems in the country. The final disposal of the same is, however, still a disputed question, the method of chemical treatment, resulting in a deposit of solid matter in settling basins, having been introduced at an outlay of thousands of dollars and which is to a certain extent satisfactory for present needs. So much for the taking away and disposal of sewerage. Now for that which interests and affects more vitally the master plumbers.

From an early beginning of cement pipe with open joints and foul odors, with small S traps being constantly siphoned, from no ventilation, and disease spreading water closets, we have a highly improved and almost perfect system of ventilation, the latest sanitary improvements of water closet, lavatory and bath, open and unin closed, affording no opportunity for the accumulation of disease germs or infectious surrounding of rotting wood work. A brief sketch of the arrangements in use here may perhaps be of interest.

While similar in many respects to those which obtain in other cities, it has possibly some features which are local in their application. Beginning with the connection with the sewer, an extension of 10 feet through the cellar wall is first made, properly connected at its outer end with a connecting cement or vitrified pipe to the sewer proper ; this connection being made by a licensed sewer layer, under the direction and superintendence of an engineer furnished by the city. Inside the cellar wall is placed a running iron trap, having on its outer or sewer side a brass clean out, and on its inner or house side a 4-inch iron inlet extending through the outer wall for the admission of fresh air, said air being drawn in by natural circulation caused by the main iron soil pipe receiving the house sewerage being extended to and through the roof of the building. From the above trap the main soil pipe is exteuded across or through the building to points under the fixtures, either above or below ground as the case may be, and thence carried up and through roof as above stated. All iron soil pipe used below ground is extra heavy. Traps of fixtures are back aired. Back air pipes are in size not less than 2 inches and are carried through roof by being increased 4 inches, or may be connected into main soil pipe before placing through roof. The fresh air drawn in at the fresh air inlet before mentioned is constantly circulated through this system of piping, insuring a perfect ventilation and rendering void any danger from escape of gas should an unknown break or defect occur in any part of drainage pipe. After the soil pipe has been put in place it is given a water test under the superintendence of the inspector of plumbing.

LOCAL VENTILATION FROM WATER CLOSETS.

The above gives an outline of our drainage arrangements. Another feature to which especial attention is given is the local ventilation from water closets. All water closets are required to have a special ventilating pipe of either galvanized iron, cast iron or copper running into a heated flue, insuring the carrying away of all foul odors from the closet above the trap. This plan has been successful to a greater or less extent, depending on the distance from the heated flue, number of angles, point of entering flue, &c. It is intended to adopt a new clause in our ordinance demanding that a special brick flue shall be constructed on one side of the house chimney in use for kitchen purposes, but having no connection whatever with said kitchen flue. This flue being constantly warmed by the adjoining chimney has a strong upward draft. Into this flue all local ventilation pipes are entered, of size not less than 2 inches in diameter. No two or more pipes are allowed to be counected, but each must enter separately and independently of each other. Formerly several closets were connected to the same ventilating pipe, said pipe being increased according to the number of closets, and the main pipe finally entering the smoke flue of the kitchen chimney under the roof. It was, however, found that in this case the least draft was at the point of entrance, and the ventilation practically a dead letter.

STYLE OF CLOSET EMPLOYED.

When the intended changes in our ordinance are in working order, it is safe to say that our buildings will be as free from foul odors as it is possible to make them. Regarding the style of closets in use for the better class of work, the siphon has nearly superseded the old style wash out, so many of which were used but a few years since, their defects having driven them from use. The siphon, with its large water seal, freedom from noise and strong action, has recommended itself favorably and is practically satisfactory. Short hoppers and combined hoppers and traps fill the requirements for a cheaper class of work, and although of course not as satisfactory as the siphon, are sanitary and fill the conditions required. The above system will in all probability be introduced into our public schools, the requirements being of such great importance in the question of pure air and freedom from disease among the thousands of children attending our schools. We consider that the principle of a plumbing fixture of any kind is that at once upon its use the foul matter which it contains should be immediately, entirely and effectually carried away. To accomplish this a perfect design of flushing from an adequate supply of water and an equally perfect system of drainage and ventilation are indispensable, and we are proud to claim that our methods have practically accomplished this. Yet we do not stop here. We are continually studying, experimenting and discussing new inventions and improvements and endeavoring to make the plumbing of our city second to none in the country. Our Master Plumbers' Association is furthering the good work by every means in its power. We are alive. We are endeavoring to make our mark, not only for ourselves and the public, but for the good of every association of master plumbers throughout the land, thereby strengthening our National Association, giving it a truly national reputation, that every one of us who are its members may hold up his head with pride and say, I am a member of the National Association of Master Plumbers.

*Essay prepared by the Sanitary Committee of the Master Plumbers' Association of Worcester, Mass., and presented at the Detroit convention of the National Association of Master Plumbers, June 19-21, 1894.

At a recent Irish Trades Congress a resolution was passed urging upon the local authorities in Ireland the desirability of electing practical plumbers to the positions of sanitary and water inspectors. This class of work had been, it was asserted, largely carried out by unskilled and unqualified men. In Glasgow, Bradford, Liverpool and Manchester the inspectors are all plumbers, and several plumbers are acting as inspectors at Belfast, Ireland, with the best results.

The Business End of Plumbing.*

BY C. C. DEWSTOE.

As a mechanical art the plumbing trade has kept pace with the progress and development of the age. As an important branch of the building art it has done more. In its adaptation to the requirements of a perfect house what other branch of building has shown such development? Masonry is substantially the same as it has always been. Carpentry, except for a little more niceness of finish and detail, shows no special improvement. The same may be said of plastering and painting. But contrast the plumbing of a generation ago with that of the building of to-day. Modern plumbing, with its beautiful fixtures, scientifically accurate piping for drainage, ventilation and water supply, involving in a high degree the principles of mechanical and sanitary eogineering, not only performs a function of the highest use and convenience to the house, but marks an epoch in the progress of civilization and refinement. It is not necessary to dwell upon this aspect of our business to men who have aided in its development and perfection, nor is it the theme of this essay to enlarge upon the excellence of plumbing as an art, but rather to inquire why a business showing such progress and improvement, both in quality and quantity, should show up so poorly as a money maker.

That, upon a broad scale, the business of plumbing is not financially successful can easily be demonstrated, if demonstration were required. Look over the records of the mercantile agencies and examine the ratings, if you can find them, of the master plumbers of the country. Ask the banks how they are rated as depositors or customers. Ask the jobbers with how much confidence they establish or increase lines of credit.

True, our friends the newspapers credit us with enormous gains. They crack their jokes, not always fresh or witty, about our diamonds, and oh, how they expatiate upon our bills.

If we could get and hold a fraction of the profits they credit us with we could well afford to smile at their extravagance and could almost forgive them for the universal suspicion their never ending jokes have thrown upon our business.

ENTITLED TO FAIR PROFITS.

I take it that no elaborate argument is needed to show that the plumbing business is entitled to as profitable remuneration as any other of equal magnitude and importance. The only question to discuss is, How shall we get it? The plain answer would seem to be to secure a reasonable profit on all the materials and labor. But this is by no means as easy to do as to state. To conduct a plumbing business successfully and profitably requires higher qualifications and greater business ability than to conduct a purely mercantile business. The merchant buys his goods at the lowest price he can obtain. He marks them at such an advance as will cover upon an average business his expense of living and management and leave a profit. If he sells his goods he makes his profit. There is little or no uncertainty about it. The plumber also buys his goods. But how does he sell them? He must fix the price when he figures his job that he is willing to take for his goods at periods all the way from three months to three years from the time he fixes his prices. He cannot accurately fix the quantity he must furnish, for plans are rarely explicit and clear enough to enable the most experienced to estimate exactly the quantity he must furnish. Further, he must look forward to the time of executing his contract and fix accurately (or suffer for it) the amount and cost of the labor required to complete the sale of his goods.

In addition to these qualifications he must possess the mechanical ability to execute or superintend and lay out the execution of the work itself. Are not these higher qualities than are demanded in the mere buying and selling of merchandise?

And, unfortuuately, is it not true that the difficulty of our trade arises from the fact that a large number of its members do not possess these qualifications? They are good workmen. They possess the mechanical qualifications in a high degree, but the other quite as important business qualifications are in too many cases lacking.

* Essay presented at the Detroit convention of National Association of Master Plumbers, June 19-21, 1894.

It is not to their discredit, but on the contrary immensely to their credit, that journeymen are ambitious to become masters. But are they not apt to overestimate the value of purely mechanical and underestimate the value of the other qualifications required in the management of business?

NEED OF COMMERCIAL ABILITY.

To know how to do the work is a valuable acquirement, but to know how to make the work pay seems to me quite as important, but it is a lesson the best practical man on earth must learn before he can make a success of the business. To make the plumbing business pay there is but one way. To make money out of a job by skinning it, by evading the requirements of good sanitary work and taking advantage of ignorance of architect or customers, will not commend itself to members of the Master Plumbers' Association, nor would they patiently listen to its suggestion. There is but one other way, and that is to weigh carefully the cost of contracts, both material and labor; to estimate carefully what may be called the incidents of the job that may go against you, and to add over all a profit that after allowing for expenses and living will leave a little for a rainy day.

How shall we accomplish this desirable end? It seems to me that it is pre-eminently the field for association work. It must to be successful spring from unity of action. The slow horse fixes the gait for the profession, and the low man largely fixes the rate for contract work.

A better price on contract work would remedy another evil of the trade, and that is the high price charged for day work and extras, and the wrangling, kicking, delay in settlements and general ill feeling resulting. It is hardly to be wondered at or greatly to be blamed if a plumber, feeling that his contracts are paying him nothing, or next to nothing, should seek to recover on work not covered by contract, but much the better and more honorable way to insist upon such a reasonable profit upon contracts that extras and day work could be executed upon substantially the same basis.

The world has not much use for, and does not long regret, the man who all his life works cheap and "lets the town bury him" It does respect the man who insists on a fair profit, who pays his bills, who lives decently, who takes a proper place in the business world and asserts himself as a man, and above all, such a man can respect himself.

Echoes of the Plumbers' Convention.

UNUSUAL INTEREST was taken in the election of officers this year. More than one section had its favorite candidate, whose claims were zealously pressed in every direction from the opening of the convention. A hot contest was therefore expected, but, as has been said of some other matters, in this respect everybody's most sanguine expectations were exceeded. It was the hottest fight ever seen in a convention of the National Association. It was any body's chance until the last ballot. Yet the strength of each candidate was pretty accurately measured by some careful observers before the first ballot was taken. The most remarkable estimate made was that of Paul Redeiske and Alex. W. Murray of Chicago. They estimated within one of Mitchell's vote, and varied only two or three from the votes given to the other candidates. As it was a large convention (309 votes on the first ballot) and there were four strong candidates in the field, it is believed that the guess made in this case was unprecedentedly close.

THE EXCURSION to the Oakland House on Friday was an event. The work of the convention was over, all cares were dismissed from the delegates' minds and they were prepared to enjoy a day's pleasure to the utmost. And it was a pleasant day. The sun shone hot, but the excursion was a trip on the water, and the hotter the weather the better at such a time. The steamer "Pleasure" left the city at 8.45 in the morning with over 1000 persons on board, passed up the Detroit River, through Lake St. Clair, past the St. Clair Flats, with shooting and boating club houses on every hand, into the St. Clair River, and finally brought up at the Oakland House at St. Clair mineral springs at 1.20. Here the passengers debarked and partook of a fish dinner, after which they scattered over the broad porches, haunted shady nooks on the lawn or "tripped the light fantastic" in one of the hotel's spacious parlors. The Knights of Tabasco seized the opportunity to give a few candidates for knighthood a public initiation, which was perhaps enjoyed more by the spectators than by the neophytes. At 4.15 the return trip was begun. Refreshments suitable for a hot day were served lavishly, dancing proceeded on the upper decks with very slight intermissions and everywhere songs were heard with great crowds joining in the choruses. The city was reached at twilight, and the excursionists separated to their hotels with enthusiastic praises of the aquatic and scenic surroundings of Detroit and thanks to the Detroit local committee for their magnificent entertainment.

A PLEASANT FEATURE of the convention, serving greatly to brighten its appearance, was the presentation of a *boutonniere* every morning to every one of the delegates. It was very thoughtful on the part of the local committee, and the favor was highly appreciated by all of the delegates.

THE RETIRING PRESIDENT, Daniel G. Finnerty, and the retiring secretary, David Smith, have the thanks of *The Metal Worker* for their unvarying courtesy. At no time was either the president or the secretary inaccessible or unaproachable. With a multitude of cares on their shoulders and harassed by all sorts of vexations, they might easily have been excused for an occasional failure to respond to a request for some piece of information. But this never happened. They were always genial and obliging. But then how could they be otherwise? They are both Bostonians and both very old subscribers to *The Metal Worker*.

WILLIAM E. CROSBY, whose name does not appear in the list of officers of the association, nevertheless fills an important official function. He is known to the officers and members as executive clerk, has served in that capacity for several years past, and will probably continue to do so for an indefinite period. His is a position which survives changes of administration, and wisely. It is necessary to have some one man to keep the run of the business of this great association, so that the details may slip along smoothly and without friction, leaving the officers free to consider the greater matters of policy for the conduct and maintenance of which the association was founded.

AT THE REQUEST of the delegates who were detained in the convention the Knights of Tabasco on Wednesday afternoon escorted the ladies to the steamer "Sappho," where the delegates found every lady provided with a good seat and delighted with the courtesy of the Knights. At 5 p.m. they proceeded across the Detroit River to the "Ben Hur" farm at Walkerville, Ont., where A. J. Alexander tendered a more sumptuous and delicious repast than any banquet, and served in an orchard; the surroundings were quite novel and romantic. The tables were laden bountifully with both the delicacies and the substantials. Native wines were furnished without stint and claret punch and lemonade for the ladies. After all had been served strolls about the farm were enjoyed. On the sound of the whistle of the steamer for the return the Knights of Tabasco seated host Alexander in a chair and with song carried him to the steamer, making a very happy feature of the occasion. The return trip was enlivened by music by the orchestra, enchanting songs by the Knights, and the only Kelly, Thomas F., entertained all by an exhibition of dancing that for grace and variety of steps surpassed anything seen on the street of Cairo. At 9.30 p.m. the guests departed to their hotels with feelings of warmest enthusiasm over their entertainment, and the Detroit Association as well as Mr. Alexander will long be remembered for their hospitality.

EDWARD H. FOX of Chicago, the Western agent of the Phœnix Glass Company, Pittsburgh, Pa., made a handsome display in Parlor S, Hotel Cadillac, of gas and electric light globes in various colors, shapes and styles of ornamentation.

IN APPRECIATION of the untiring efforts of John Yule to provide a full delegation from New York, to insure comfortable transportation, ample refreshments and

satisfactory seating on the West Shore train, a party of conspirators started a fund with the intention of presenting him with some token of their appreciation. Samuel L. Malcolm, William C. Young and Philip Smith, the committee, secured a handsome Etruscan gold heart locket. One side bordered with a scroll design was set with three diamonds, the other bore this inscription: "John Yule, from New York Delegation M. P. A., Detroit, 1894." At a meeting of the delegation the token was presented by Samuel L. Malcolm with a cordial speech and received by Mr. Yule with such remarks as showed the heart he received was of no truer metal than the one he has always worn.

THE MICHIGAN STATE ASSOCIATION OF MASTER PLUMBERS is a live organization and is laying out some work that will be for the good of all when completed. James Meathe of Detroit and Colonel Wheeler of Kalamazoo are shaping matters to introduce a new law in the next session of the legislature similar to the Massachusetts law printed in *The Metal Worker*, June 16.

BOWERMAN & ALLEN, Detroit, circulated a little blue covered pamphlet of their Unique water closet, giving "four reasons why" all should buy it. On the first cover page they say: "You pull the chain, we do the rest." This should be attractive in some cases.

MARK E. MONASH of the Van Auken Steam Specialty Company, Chicago, pointed to their patent deflecting shield seen on all the raidators in the hotel.

THE PICTURE of "Uncle Josh," circulated by the Park & McKay Company, Detroit, will make their Utopia water closets and seats and cisterns long remembered by all who saw them.

M. T. WHITNEY represented the Raymond Lead Company of Chicago. Yet the weight of his goods neither depressed him nor the many who are glad that they met him.

AS THE PARADE FORMED in front of the Cadillac every plumber and knight was presented with a hard rubber match safe, bearing a horeshoe with the words "Capital Luck" on it, the trade-mark of the United States Heater Company, Detroit, and the names of the Capital, Hecla and Mascot steam and hot water boilers.

A NICKEL PLATED PIN TRAY or ash receiver, bearing the word "Richmond," formed of a peacock with his tail spread, made Parlor N, the headquarters of Thomas J. Douglas, sought alike by the ladies and the gallants. Mr. Douglas represented the Richmond Stove Company, Norwich, Conn., and found little time to talk steam and hot water boilers.

MUCH of the pleasure afforded the visiting ladies is due to the superb management and untiring energy of Mrs. M. L. Comstock, who guided everything so that no friction occurred. Mrs. Comstock is a sister of the Lane Bros., prominent plumbers in the city.

THE SPLENDID NEW TROTTING TRACK that is being completed at Detroit has a kitchen of the most approved style, with carving tables and a mammoth Peninsular steel range The men's toilet room is provided with 24 water closets and 32 urinals arranged to flush in series of eight. This work was done by Lane Bros.

THE IOWA DELEGATION distributed an official directory of the Iowa M. P. A., giving the officers and the members and their address.

C. H. WILLIAMS won all the ladies to the Dunning boilers by presenting them with a souvenir bottle of Lundborg perfumery, with the compliments of the New York Central Iron Works, Geneva, N. Y.

THE ROUSE & HILLS COMPANY, manufacturers of plumbers' goods, at Cleveland, Ohio, could have no more active and genial representative than Geo. E. de Heredia, who was met with a smile whenever he met a plumber.

TRAPS AND VENTS.

IN A RECENT ISSUE of a Baltimore paper a pleasant reference is made to the action of the Henry McShane Mfg. Company of that city in restoring to their employees the 10 per cent. which had been cut from their wages during the past winter. At the time of the reduction many complaints were made and a strike was talked of. Better counsel prevailed, however, and the men are now in a position to congratulate themselves that they did not resort to any violent method.

IN AN ADDRESS on the Progress of the Trade and its Future Development presented by Louis F. Meyer of Milwaukee at the Detroit convention of the National Association of Master Plumbers occurred the following paragraph in reference to the progress of the craft: The trade schools in the East are at least a beginning in that direction and in their limited capacities are doing a noble work for us, but time works wonders and I expect to see the day when the applicant for apprenticeship will be obliged to enter a preparatory school, just as our doctors do now, where they can acquire an insight into the fundamental principles of sanitation before they are allowed to figure as master plumbers.

JOHN HARDIN has opened a new plumbers' supply house at 3883 Cottage Grove avenue, Chicago.

M. REILLY has opened a branch plumbing shop in the room with Rand & Rader, Peru, Ind.

LEIGHTON, DAVENPORT & Co. have purchased the plumbing business of Hiram Norton in Bar Harbor, Maine.

AMONG RECENT INCORPORATIONS at Albany, N. Y., was the Standard Commode and Closet Company, to manufacture water closets and appurtenances in Brooklyn. Capital, $12,000, and directors, D. K. Osbourne and James Simpson of Brooklyn, and George F. Simpson of Montclair, N. J.

THE ITHACA PLUMBING & STEAM HEATING COMPANY, Ithaca, N. Y., is the name of a new firm that have been started by S. J. McKinney and others to do plumbing and steam heating.

E. J. MCNAMARA, formerly of the firm of Westwater & McNamara, Columbus, Ohio, has built at 46 Gay street, that city, a handsome structure for his own gas fitting business. The interior of the building is fitted up most completely, the walls being handsomely papered in pleasing colors. The basement is used as the work and stock room, while the store room proper is above. Here are shown an extended variety of gas and electric light fixtures, chandeliers, clusters, brackets, &c. In the center of the room is a pillar to which all electric lights center, which is surrounded by a circle of electric lights. The walls are arranged for a further display of goods. Besides the articles mentioned Mr. McNamara carries a full line of gas heating and cook stoves adapted for either natural or artificial gas.

IT IS REPORTED that P. A. Costello has opened a plumbing and heating business at Oshkosh, Wis.

WE ARE INDEBTED to Peck Brothers & Co., New Haven, Conn., for a copy of their catalogue of water and gas works goods. This pamphlet is serviceable in shape and size and is published with that neatness and excellence of workmanship that distinguishes the catalogues of this company. There is nothing particularly ornamental about it, but the matter is presented clearly, the illustrations are good and full particulars of sizes, numbers and the necessary information for buyers are presented. The pamphlet, which is bound in pebble cloth, rounded corners, contains 70 odd pages, almost all of which carry several illustrations. In the beginning is an index, which is followed by a complete telegraphic code. The goods illustrated are bibbs, stops, cocks, nipples, couplings, sprinklers, nozzles, hydrant work fittings, &c.

Some American Tin Plates.

We have been favored by the New Castle Steel & Tin Plate Company. New Castle, Pa., with a number of beautiful samples of the tin and terne plates made by them. These are genuine American material in the most rigorous sense of the term, the product from the ore to the finished plate being manufactured at the company's own works. As an illustration of what the American tin plate industry is capable of accomplishing, these plates are remarkable in their excellence of finish and superior qualities. They include IC and IX bright plates of both coke and charcoal finish, and of light and heavy weight, as well as heavily coated "old method" and ordinary terne plates. Each description is excellent, comparing with imported plates of like quality, generally to the advantage of the home product, and evidencing an extraordinary degree of progress for a works that is little more than eight months old. Accompanying the consignment were samples of light plates of No. 38 gauge, coke finish, which are claimed to be the lightest gauge tin plates ever made in America, and, probably, anywhere else. The metal coating of these sheets is evenly distributed, and the plates present a very handsome appearance. It is said to be impossible to tin black sheets of thinner gauge than these, as, in the process of pickling, the acid would eat them into holes. As it is, we understand that the coating of these 38-gauge sheets requires the greatest care in order to prevent this occurrence.

The New Castle Steel & Tin Plate Company's mills are capable of turning out much thinner black sheets than even 38 gauge, as is testified by samples sent to us which are thinner than the paper on which *The Metal Worker* is printed.

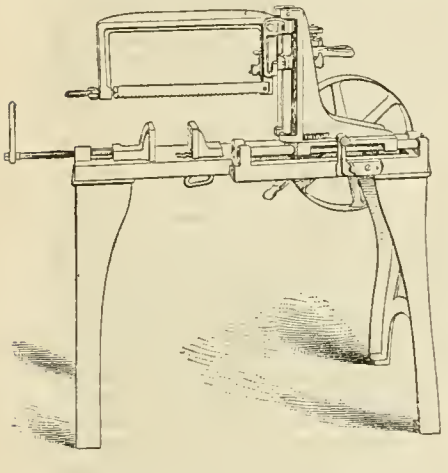
Captain Mahan has informed the Navy Department that the boilers of the "Chicago" have given out, and that it will be necessary for the vessel to remain a month or more at Antwerp for repairs. The "Chicago's" boilers have been in use since the vessel was launched. They will be replaced with new ones when she returns to the United States.

The Halifax, Nova Scotia, Board of Trade has memorialized the Canadian Government for a subsidy to enable the present telegraph cable from that port to Bermuda to be extended to Jamaica and other West Indian islands.

Dr. Senner, the United States Commissioner of Immigration at the port of New York, reports that just as many people left the United States in the steerage as have arrived during the 11 months to May 31 last.

The Q & C Shop Saw.

During recent years there has been a demand for power driven hack saws for cutting metal. Heretofore these machines have been provided with a gravity feed. The machine here illustrated —designed by the Q & C Company of Chicago and New York—has a positive automatic screw feed, and the speed can be instantly changed to accommodate hard or soft metal, large or small size. It will cut all kinds and sizes of metal up to 6 inches in diameter. The cutting speed is always the same. The stroke is horizontal, insuring perfectly square work, while the movable vise permits the entire length of the saw to be used. The machine is provided with an automatic stop. It is stated that this machine will do more work than the usual type, and that the saws will last much longer.



The Q & C Shop Saw.

SCRAP.

We are indebted to Edward Allred, 750 North Illinois street, Indianapolis, Ind., for a photograph of drawings illustrating a new tin plate package, upon which, we understand, he has secured a patent. It is a sheet metal box made with sliding cover and for which special claims of strength and durability are made. It is also claimed to be inexpensive in construction.

It is estimated that the salmon pack on the Columbia River will fall short of that of last year by more than 100,000 cases, owing to the recent floods. The manager of the Pacific Can Company, Astoria, Ore., places the probable decrease in the demand upon the works for cans at about 20 per cent. below the average, on account of the short catch.

Blairsville Rolling Mill & Tin Plate Company, Blairsville, Pa., closed down last week temporarily.

The Pittsburgh Tin Plate Works, New Kensington, Pa., about 20 miles from Pittsburgh, have given a contract to the A. Garrison Foundry Company of Pittsburgh for the erection of a two-mill plant, and when completed will roll their own sheets for tinning purposes instead of buying them as heretofore. The new addition will be so constructed that two additional mills can be added at any time desired.

The Baltimore & Ohio Railroad has obtained a seven years' extension of its control of the Chesapeake & Ohio Canal, and will, it is reported, operate it by electricity.

HEATING and PLUMBING.

NEW WORK AND CONTRACTS.

Jos. E. O'Malley, 215 North Wells street, Chicago, has the contracts for the plumbing, gas fitting and sewerage in the following flat buildings: W. F. & W. E. Ross, Barry and Evanston avenues; P. O'Malley, Erie and Market streets, and A. Modine, 98 Townsend street.

Sealed proposals will be received at the office of the Supervising Architect, Washington, D C., until July 20, for roofing, sheathing, slate and copper work of roof, dome and drain pipes, roof skylights, &c., for the Post Office Building at Worcester, Mass. Drawings and specifications may be obtained at the office of the Supervising Architect, Washington, or from the superintendent at Worcester.

The contract for the plumbing of the new office building now in course of erection on Fifth avenue, Pittsburgh, by the Carnegie Steel Company, Limited, has been let to Weldon & Kelly of that city. It is stated the contract amounts to about $40,000, which makes it one of the largest plumbing contracts ever let in Pittsburgh. There will be 14 separate sets of pipes varying in size from ¾ inch to 8 inches in diameter, extending from the foundation to the top of the building, upward of 240 feet. In all there will be nearly 5 miles of iron pipe, most of which will be double strength. All exposed pipes and fittings will be polished brass and nickel plated. The system of waste and ventilation will be what is known as the Durham system, all the pipes being wrought iron. The water supply from the street will be forced into two immense tanks on the roof by two separate steam pumps, after first passing through a filter and a suction tank in the basement. The water will then be conveyed back to the basement into two large distributing drums, and thence to the various fixtures. Two 350-gallon boilers will provide hot water for lavatories, &c., and return circulation pipes will keep the water constantly warm and ready to be drawn at any of the faucets. On the thirteenth floor the main lavatory will be located and will be notable for elegance of detail. In the sub-basement provision is made for a gymnasium and swimming bath for the exclusive use of the employees of the Carnegie Company. The contractors have begun work and expect to finish by January, 1895. There were nine bidders.

Lee Brothers, Concord, N. H., have been awarded the contract for the plumbing work of the new State library, and will also put the heating system in the National State Capitol Bank, using for the purpose a Gurney hot water heater.

Bids will be received by John S. Noble, City Clerk, Easton, Pa., until July 3 for the heating apparatus for No. 2 Engine House.

The contract for the plumbing of the Clay School building, Fort Wayne, Ind., was awarded to Byron Hattersley.

Sealed proposals will be received by the Board of New City Hall Comsioners, San Francisco, Cal., until July 2 for work, including the hot water heating, gas fitting, plumbing, &c., of the new City Hall.

Isaac Coffin & Co., Boston, Mass., will place a No. 5 Richmond hot water heater in a house owned by B. C. Leonard of Boston.

The contract for heating the Odd Fellows' Hall, Norwalk, Conn., has been awarded to E. K. Lockwood of Norwalk, who will use a No. 50 Richmond steam heater.

Sealed proposals will be received by John H. Peck, chairman of the Board of Court House Commissioners, Troy, N. Y, until July 14, for heating and ventilating by the hot blast or plenum fan system the new court house for the county of Rensselaer.

John D. Mouatt, Detroit, Mich., is doing the plumbing in the Wilson apartment houses. He will furnish 24 bathrooms with enameled baths, water closets and lavatories, besides the kitchen and laundry fixtures.

Barlow Bros. Company, Waterbury, Conn., will do the plumbing work on a fine new residence now being built in that town for Geo. B. Lamb, superintendent of the Farrel Foundry & Machine Company.

Hon. George Nicols, Northfield, Vt., has awarded the contract for heating his house to E. H. Randall & Co., Concord, N. H., who will use a No. 55 Richmond steam heater.

The Theo. Jacobs Company, 72 and 74 Market street, Chicago, are to install a hot water heating plant in the residence of Oscar Foreman, Michigan avenue, near Thirty-fourth street.

Kehm Bros. & Mertz, 289 Kinzie street, Chicago, have the contract for steam heating in the residence of John J. Schillo, 218 Mohawk street.

The Walsott-Hurlbut Company, 175 and 177 Lake street, Chicago, are to furnish the Siphon Eduction closet ranges for school buildings at Pontiac and Streator, Ill.

Among the contracts recently taken by Cook & Chick, 253 and 255 Kinzie street, Chicago, can be mentioned the following: Steam heating plant in the residence of William Holtz, Barry and Graceland avenues; hot water heating plant in the residence of D. L. Thomas, Forty-eighth street and Madison avenue.

Sealed proposals will be received at the Commissioners' Office, Franklin, Pa., until July 6, for work, including the plumbing, in the Venango County jail.

The Common Council of Duluth, Minn., have confirmed the award of contract made June 11 by the Board of Public Works with Allen Black for steam heating and plumbing in the Central Fire Hall, at $3592.

The Davis Johnson Company, 45 Jackson street, Chicago, are to place Schill's New Idea warm air furnace in the following residences: P. Clements, 4253 South Halsted street; J. C. Whitten, 6538 Myrtle avenue; H. F. Rose, Sixty-third street and Greenwood avenue; V. C. Clare, Commercial avenue; John Bell, 5519 Emerald avenue; A. W. McCormack, 400 Sixty-seventh street; Geo. J. Shannon, Sixty-fifth and Peoria streets; Dr. E. B. Greene, Humboldt boulevard; Wm. M. Townsend, 7648 Ford avenue; Wm. Easton, 616 Waller avenue; W. F. C. Bronter, 1566 Fulton street.

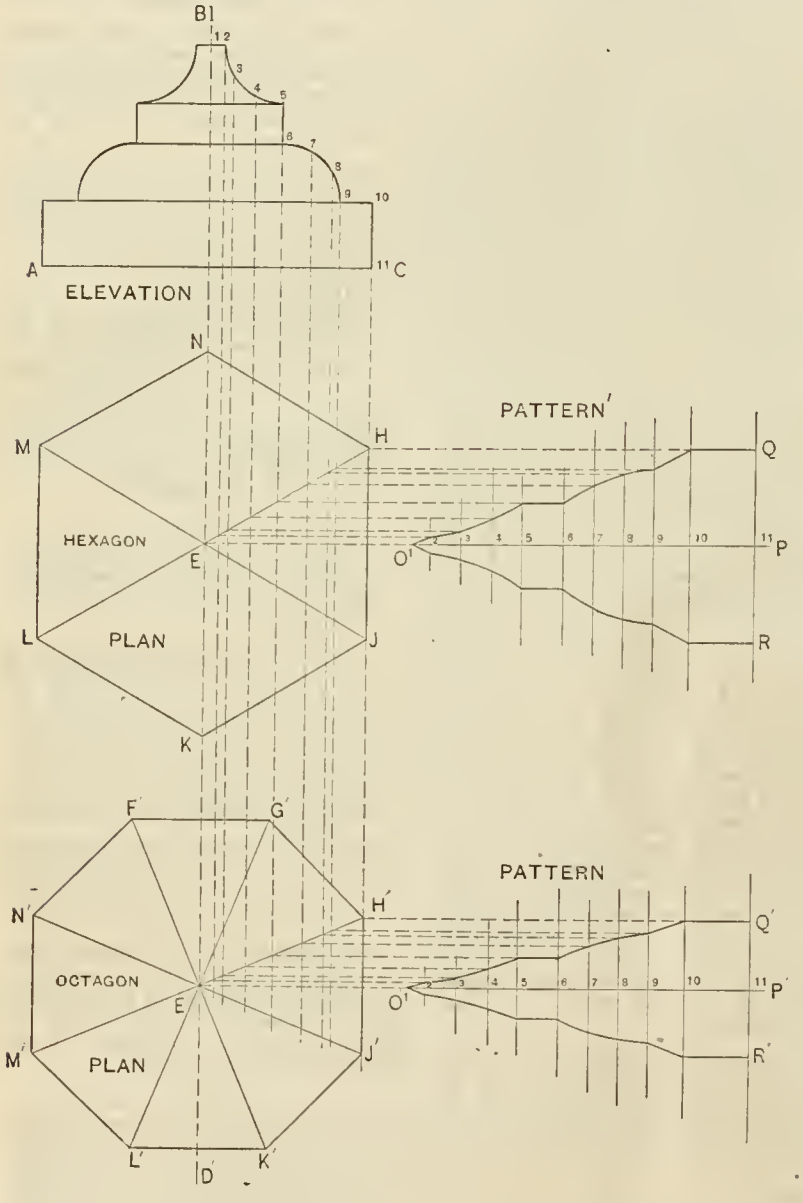
The new city directory of Chicago gives an estimated population of 1,700,000 to the Windy City.

ROOFING AND CORNICE.

Pattern for Article Having Any Number of Pieces.

From C. R., *Newark, N. J.*—Will *The Metal Worker* publish a method for obtaining the pattern of an article, such as a finial or leader head, in any number of pieces?

Answer.—We understand from the above that our correspondent wishes a method for obtaining the pattern of an article that is a regular polygon in plan. In the accompanying engraving let A B C represent the article in elevation for which patterns are required. Below the elevation is shown the hexagon H J K L M N, and the octagon F′ G′ H′ J′ K′ L′ M′ N′. These two plans show the manner in which the plan is to be drawn under the elevation for an article having any number of pieces. To obtain the pattern of an article that is a polygon in plan, first draw the elevation in such a manner that one side will appear in profile in the elevation, as B C, and place the plan so as to correspond in all respects with it, as shown. For the pattern of article A B C, the plan of which is a hexagon, proceed as follows: Divide the profile B C into spaces of convenient size and number them, as shown by the small figures. With the T square placed parallel with C J, and brought successively against the points in profile, drop lines across the miter lines, as shown by the dotted lines in the engraving. Lay off a stretchout, O P, at right angles to the side of plan H J, corresponding to the side of article B C of elevation. Through the points in stretchout line O P draw the usual measuring lines. Place the T-square parallel to the stretchout line, and, bringing it successively against the points in the miter lines, cut corresponding measuring lines, as shown. Lines traced through the points thus obtained, as shown by Q O R, will be the pattern of part of article shown by H E J of plan. The pattern for H′ E′ J′ of octagon, as shown by Q′ O′ K′, is obtained in a similar manner.



Pattern for Article Having Any Number of Pieces.

FLASHINGS.

A. S. Rasner of Rasner & Dinger, Pittsburgh, manufacturers of metallic skylights and sheet metal work of all kinds, will have the sympathy of his friends and the trade in general in the loss he has met with in the death of his son Albert, who lost his life a few days ago by drowning while bathing in the Allegheny River with some friends. The young man, who was in the employ of his father, was universally respected.

W. J. Burton & Co., Detroit, Mich., manufacture sheet metal cornices, ceilings, skylights, finials and shingles and furnish slate, tin and steel roofing. They issue a special catalogue of their Eastlake metal shingles and tiles, giving the advantages and full instructions for putting them on. All of their goods are painted on both sides. They also make a full line of conductors and elbows and eave trough of galvanized iron in 8-foot lengths.

In connection with the covered reservoir lately completed at Rockford, Ill., the roof employed is something of a departure from old style coverings for this purpose. It is of concrete, composed of sand and cement, but it is only 2 inches thick. It is supported on concrete arches which span the entire width of the reservoir, the ribs being 7 feet apart, 7 inches thick and about 1 foot deep over the top. After these were made expanded metal lathing of 2½-inch mesh was spread over the surface and then concrete laid on to the depth of 2 inches. The roof is calculated to hold a weight of 100 pounds to the square foot. After the temporary supports were removed the under side of the roof was plastered, completely covering the iron.

The White & Ennis Cornice & Roofing Company of Troy, N. Y., were incorporated last week, with a capital of $7500. Directors: David White, Jesse D. Ennis and Robert J. Wylie of Troy.

Among the contracts recently taken by James A. Millar & Bro., 129 and 131 Clinton street, Chicago, can be mentioned the following: Slate and other roofing for the residence of George P. Barton, Fifty-third street and Lexington avenue; cornice work for building of Henry Appel, Fiftieth street and Michigan avenue; 250 squares of corrugated iron work for Chicago Sugar Refinery; new red slate roof for Chicago

Club House, Van Buren street and Michigan avenue; slate roof and copper work for residence of Chas. F. Atkinson, 4833–5 Lake avenue; roof for new tower of Board of Trade building.

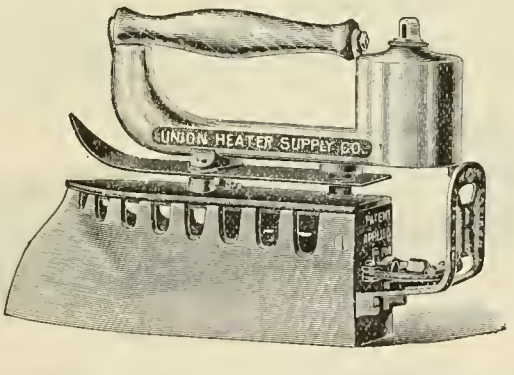
THE PENN IRON ROOFING & CORRUGATING COMPANY, LIMITED, of Philadelphia, Pa., have issued a number of supplemental pages intended to be inserted in their ceiling catalogue. The pages carry illustrations of plain reeded ceiling plates and sheets, designs of special shallow panel ceiling plates, shallow molded plates in combinations, together with colored designs showing corners of ceilings finished, while other designs are of centers and mold combinations. The pages are numbered, showing their position in the regular catalogue of the company.

JAMES J. WHITE, 185 Dearborn street, Chicago, is to furnish the tin roofing, galvanized iron cornice work and a skylight 40 x 60 feet, for a hotel building at La Fayette, Ind.

AMONG the contracts recently taken by J. C. McFarland, 2511 to 2519 State street, Chicago, can be mentioned the following: Copper cornice work and tile roofing for the residence of Leon Mandel, Michigan avenue and Thirty-fourth street, the Telladon Terra Cotta Company's new shingle tile to be used; copper cornice work and tile roofing for residence of Philip Armour, Jr., Michigan avenue and Thirty-second street; slate and copper work for the court house at Aledo, Ill.

Self Heating Tailor's Iron.

The Union Heater Company, Detroit, Mich., manufacture a self heating gasoline tailor's iron, a general view of which is shown in the accompanying illustration. The body is made of cast iron and the tank is of brass, both being heavily nickel plated. The burner is on the inside and the gasoline passes from the tank down through a brass generator, which is also on the inside of the iron, flows into a valve and then into the regular burner, where the flame strikes the bottom of the iron. The flame is controlled by an angle valve on the back in such a manner that it can be brought from a low flame to an intense heat immediately. The irons are manufactured in three sizes, 18, 20 and 22 pounds, and can be operated, it is said, at the small expense of 2 or 3 cents a day, enabling the tailor to turn out more work with greater comfort, and get rid of the annoyance of dirt and soot met with in the use of charcoal.



Self Heating Tailor's Iron.

The Fennessy Company of New York City have been incorporated, with a capital of $20,000, to deal in patented gas and oil burners, stoves, heaters, &c. The directors are Frank R Fennessy, Emma H. Fennessy, Chas. Feichheimer and Eugene A. Schell of New York.

Rustless Iron.

At the recent Montreal meeting of the American Society of Mechanical Engineers, M. P. Wood presented a paper on "Rustless Coatings for Iron and Steel." It is a general summary of the methods in vogue without special reference to any experience personally acquired. Mr. Wood summarizes his conclusions on the whole question of how best to protect iron and steel from corrosion as follows:

Don't use anything but common iron.

Don't have any scale on that.

Don't use anything but the best iron and steel.

Don't polish those.

Don't paint it with anything but pure linseed oil and oxide of lead or graphite paints.

Don't let the air get to it if it is damp.

Don't keep it from the air if the air is pure and dry.

Don't let sea air, sea water, acidulated or sulphurous, ammoniacal or other fumes and liquids have access to it.

Don't think it unnecessary to protect it in any case, because swords, armor and other bright articles of iron and steel have been found uninjured by rust after an exposure of over 500 years with no other protection than that afforded by the closed room in which they were placed.

Don't think your own product would not under the same conditions last as long as the piece of iron that was walled into one of the burial chambers of the Pyramid 3000 years ago.

Don't put it in any location where it cannot be inspected and its true condition ascertained at any time, by anybody, your successor in the trust not excepted.

Don't think that magnetic oxide, electroplating, enameling or any other method of protection will take the place of constant inspection, even if the coating is fired on by a Columbiad.

Don't imagine because Cleopatra's Needle has had to have a coating of wax to protect it, that it is not a good material to apply to other substances than granite.

Don't let the cost and interest accounts be the governing factors in the case of protecting any metal superstructure on whose continuity and strength human life and safety depend The old story of "for want of a nail the shoe was cast, the horse disabled, a battle and kingdom lost," finds too many parallels in the engineering practice of to day, until in some cases we seem to need protection from the engineer quite as much as from the decay of the materials in which he experiments.

Don't imagine that Macaulay's New Zealander, who has sketched the ruins of England's power and greatness, and has come to the New World to see how we have fared from the gnawing teeth of time, will not recognize amidst the ruins of our Statue of Liberty, Brooklyn Bridge and other monuments of our progress, the ominous streaks and stains due to the corrosion not only of iron and steel, but that of the better class of metals, and will exclaim: "We are wiser in our generation and fear not and can control these forces that, like the Arch, slumber not nor sleep."

In the discussion, J. F. Holloway called attention to the fact that tin roofs in Montreal were not painted, a circumstance which was attributed to the use of good materials and the distance from the sea air. C. W. Nason reported that for tank and outdoor use, in his experience, the best protection is the P. & B. paint, a solution of asphalt in bisulphide of carbon. Gus. C. Henning called attention to the experiments recorded by W. Thomson in a paper read before the English Society of Chemical Industry. The method proposed is to connect structures by wire with a ball of zinc buried in moist ground, thus transferring the destructive effects of electrolytic action to an outside body.

James McBride of Brooklyn related his experience with a number of boilers in his paper, "The Corrosion of Steam Drums." From his observations and experiments, extending over nearly four years, he draws the following conclusions:

1. That the corrosion is due primarily to excessive moisture in the steam in the drum.

2. That moisture in this case was due to the priming of the boilers and surface condensation in the drum.

3. That the trouble was aggravated, because no provision was made to take away the water from the drums by drip pipes.

Professor Hutton presented a sketch of a 3-inch cast iron elbow from the bottom of the descending column of a Bulkley condenser used near Port Henry, N. Y., as an illustration of mechanical corrosion. J. T. Hawkins gave it as his experience that currents of water in pipes wear away the metal, and that the impact of steam or water or water laden steam produces the same result. L. S. Randolph noted that water charged with sediment causes corrosion by attrition and by the mechanical removal of the oxide. Fred. Grimm reported that trouble caused by corrosion in steam coils was overcome by establishing good drainage.

Extensive improvements are being carried out at the sheet iron mills of the McCullough Iron Company, North East, Md. Several oil burning furnaces are being introduced, and a tank to hold 25,000 gallons is in course of construction for the purpose of supplying oil to the furnaces.

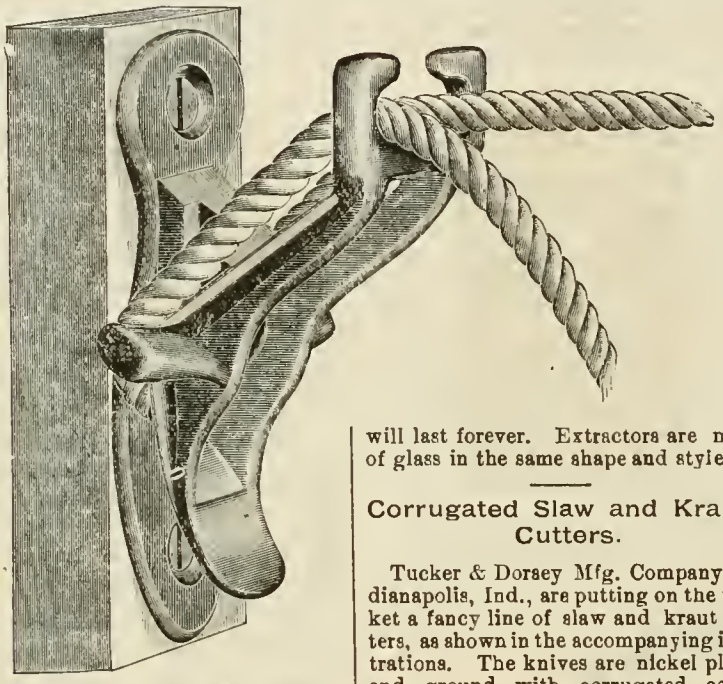
Asbestos, says a South African journal, is being mined in large quantities on the Kalputs farm, Prieska District.

The result of the Derby race was received in New York by the United Press from the office of the Direct United States Cable Company just one second after it was filed in London.

THE RETAIL STORE.

Lightning Clothes Line Fastener.

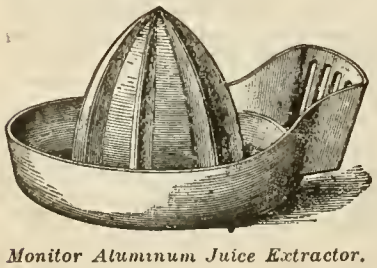
The accompanying cut represents a clothes line fastener introduced by the Standard Mfg. Company, Florence, Mass. Among the desirable points claimed for the fastener are the following: That the line can be put up, taken down, tightened or slackened in a moment; that knots are obviated; that lines cannot slip; that cold or wet weather does not affect the fastener; that should a line break between two fasteners the remaining line or lines would in no way be disturbed, and that no clothes pole is required, as a pull on the line makes it tight and the fastener holds it. The fasteners are furnished japanned or galvanized, packed one dozen in a box, two gross in a case. The manufacturers will furnish a sample free, post-paid, and will quote prices upon application.



Lightning Clothes Line Fastener.

Monitor Aluminum Juice Extractor.

Sterling Aluminum Company, 1195 Fulton street, Brooklyn, N. Y., are offering the aluminum juice extractor here shown. It is cast of pure aluminum and has well defined ridges on the cone. It has a large reservoir to hold the juice and an ample spout and strainer. It is not necessary to use it in connection with a cup or glass, as the reservoir catches the juice, so the extractor may be used anywhere. The manufacturers claim that fruit acids do not affect it; that it will not corrode or tarnish; that it will not break like glass, and that it will last forever. Extractors are made of glass in the same shape and style.



Monitor Aluminum Juice Extractor.

Corrugated Slaw and Kraut Cutters.

Tucker & Dorsey Mfg. Company, Indianapolis, Ind., are putting on the market a fancy line of slaw and kraut cutters, as shown in the accompanying illustrations. The knives are nickel plated and ground with corrugated edges.

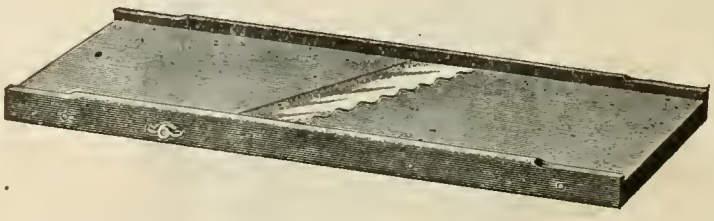


Fig. 1.—Corrugated Slaw Cutter.

The goods are referred to as made throughout of extra quality material and of handsome finish. Particular attention is called to the patented device for the adjustment of the knives, it being explained that the bolts are loosened, the knives set for the desired cut, and the bolts again tightened, no other directions being necessary. By taking out the bolts the knives are released and may be removed for sharpening.

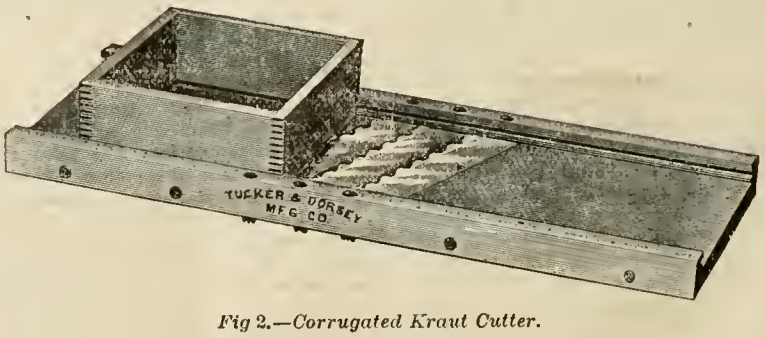

Fig 2.—Corrugated Kraut Cutter.

Wick Raising Movement and Lighting Lift.

The Plume & Atwood Mfg. Company, 18 Murray street, New York, are applying improvements to all their Nos. 1 and 2 Royal lamps and founts as herewith illustrated. The ratchet wick raising movement shown in Fig. 1 gives, it is stated, perfect control of the wick with exactness in adjustment. The point is made that it overcomes the objection to the draw bar lift, which in regulating is apt to move beyond the point desired, causing the annoyance of a smoked chimney or an extinguished flame. The lighting lift in Fig. 2 lifts on a spiral movement and remains in position while lighting without removing either shade or chimney, leaving the hands absolutely free. The improvements are put on the Royal hand, table and banquet lamps of different designs, and also on those in wrought iron patterns.

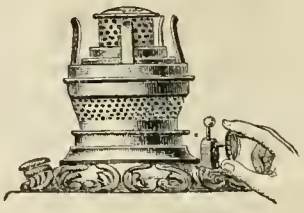

Fig. 1.—Ratchet Wick Raising Movement.

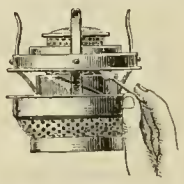

Fig. 2.—Lighting Lift.

Hoffman's Vault and Library System.

The Geuder & Paeschke Mfg. Company of Milwaukee, Wis., have absorbed the business of the Hoffman-Keefe Office File Company, and are now manufacturing that company's specialties, among which are the Hoffman vault and library fixtures, recently

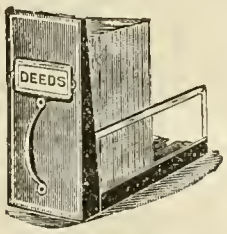

Fig. 1.—Document File.

brought out. By this system, large vaults for the use of banks, merchants and manufacturers, requiring a large amount of room for the storage of valuable papers, are fitted up with metal shelving, drawers, compartments, files for letters, &c. Illustrations are here-

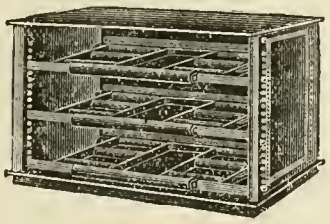

Fig. 2.—Roller Book Shelves.

with given of some of the features of the system. Fig. 1 is a file for compressing documents. The compressor grips the papers from the center down and squeezes them. The file comes

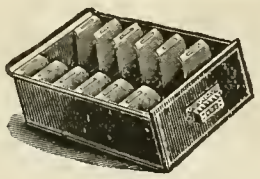

Fig. 3.—Check Sorter.

clear out of its compartment and hangs there. The papers can be shuffled any way, as the file has no sides. A special kind is made for bank checks. Fig. 2 represents

Fig. 4.—Metal Cabinet.

a set of roller book shelves intended for storing large, heavy office books. They are laid flat and given an even bearing on rollers to prevent friction or wear. Fig. 3 shows a check sorter which has been found very convenient in banks. In Fig. 4 is shown a metal cabinet. Fig. 5 represents a nest of safety deposit cells, each with its own key. These are frequently used by large companies, each of whose officers desires a storage place for his own personal documents and valuables. Fig. 6

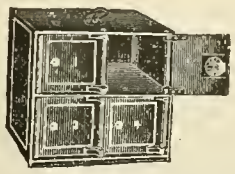

Fig. 5.—Safety Deposit Cells.

is a vault omnibus or movable case, which is found a most convenient article in offices in which a large number of books and papers are in daily

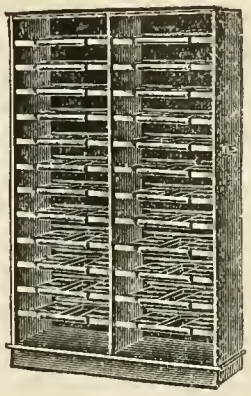

Fig. 6.—Movable Case.

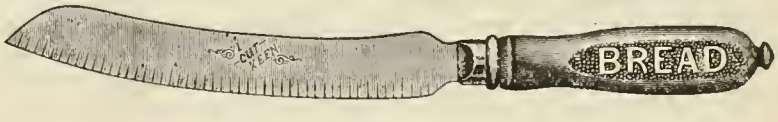
use outside of the vault. It is made with roller book shelves. The whole case is mounted on double wheel anti-friction casters, so that one person can easily run it in and out of the vault. The casters are hidden by the risers of the base.

The Goodell Bread and Cake Knife.

The cut here shown represents a bread and cake knife put on the market by Goodell Company, Antrim, N H. The knife has a curved. saw toothed cutting edge, and it is remarked by the company that the high grade of steel used in the blade enables it to be made very thin. The side of the blade is perfectly flat, the corrugations or curves extending about ⅛ inch from the edge, being the same depth their entire length.

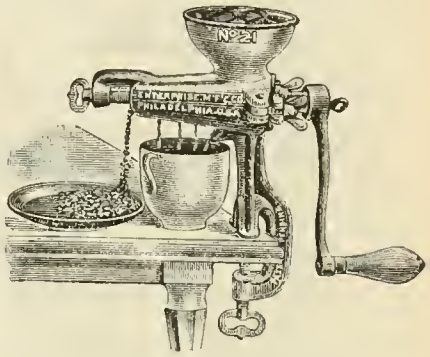
The makers state that when necessary the blade can be ground on the side opposite the grooves without changing the shape or cutting qualities of the edge in the least; also that no skill is required to do this, as it would be impossible to get the edge out of shape. The manufacturers claim that the feature of sharpening is peculiar to this knife, and that it can be sharpened again and again and remain practically as good as new. The point is also made that the style of the handle, shape of the blade and the general appearance of the knife are attractive. The knife is referred to as particularly adapted to cutting hot bread and cake.



The Goodell Bread and Cake Knife.

Enterprise Juice Extractor No. 21.

The cut here shown represents a juice extractor put on the market by the Enterprise Mfg. Company of Pennsylvania, Philadelphia, for whom J. C. McCarty & Co. are agents, 97 Chambers street, New York. The manufacturers state that the construction of the extractor is mainly the same as their regular combination press, with the addition of such mechanical devices as to adapt it for the extraction of juice from meat, also answering for extracting seeds and



Enterprise Juice Extractor No. 21.

juice from fruits. It is explained that the machine being tinned no metallic or inky flavor will be imparted to the material used, and that the dryness of the pulp or refuse can be regulated by the thumb screw at the outlet.

MEMORANDA.

Frank Hesse of Clarksville, Iowa, announces that he has secured the services of W. A. Kirck, a practical cornice man, and is prepared to manufacture anything in that line. Mr. Hesse carries in stock a varied assortment of stoves, hardware and tinware.

S. Fox of No. 139 New Main street, Yonkers, N. Y., has recently doubled the capacity of his house furnishing store. The premises now occupied are 25 x 50 feet in size, and in calling the attention of the people of Yonkers to the increased capacity of the store Mr. Fox distributed fans on the back of which are verses telling in a clever way of the growth of the business, and asking patronage of the good people of Yonkers.

The Ellicott Electric Heating Company of Buffalo were incorporated on June 22, with a capital of $25,000, to manufacture apparatus for electricity for heating and power purposes. The directors named are C. W. Pardee, John N. Scatcherd, Daniel O'Day, Edwin T. Evans, Barrett Rich, George Urban, Jr., Joseph L. Hunsicker, Charles R. Huntley, John J. Albright, Edmund Hayes and Franklin D. Locke of Buffalo.

STOVE TRADE NOTES.

Philadelphia Stove Trade.

The season has opened and salesmen are out, but reports so far indicate that the bulk of the business will be somewhat late. Sufficient business, however, is being done to create a demand which exceeds the production, and there being practically no stocks in the hands of dealers, manufacturers anticipate a good season's business. Dealers are hesitating about placing their orders, many questions arising to delay action. They realize that the hand to mouth buying indulged in last season will not be safe to attempt this year. Stove manufacturers have all along been producing only in quantities sufficient to supply current demand, and count on taking care of any increased inquiry which a change in the business conditions of the country may bring by running their works full capacity. The opinion prevailing is that such a change is not far distant, and by fall foundries will be running full. Buyers, therefore, are studying their prospects for business, and orders will assume fair proportions. Duplicate orders cannot be depended on, as in the event of a rush, which is not at all improbable, the filling of orders would not be prompt and serious delays would ensue. Orders would, of course, have to be taken in rotation and it would be hard to specify dates for delivery.

Wise dealers are already approaching their customers on the subject of repairs. Manufacturers have very light stocks of repairs on hand, and if their foundries have to stand a run on them for finished goods it will be impossible to pay attention to repair orders, as every flask will be utilized in getting out the regular goods, and it would be neither expedient nor profitable to bother with repairs. The latter can be readily furnished now, but it is likely there will be difficulty experienced in getting them later.

Prices of goods are firm, and in view of the fact that owing to the decreased production of foundries the cost of production has been greater, there is not the slightest prospect of a cut in prices being made. It is true that the cost of iron is very much reduced, but the cost of labor remains the same and the gain on account of cheap iron is too trifling to take into consideration. Again, no more business could be done by cutting prices, the decrease in production all round offsetting any necessity for seeking to unload at a sacrifice.

Collections are slightly better than when last reported, although they are far from being up to the mark. There is still a good deal of laxity on the part of some in the trade to make settlements, and they will not settle in cash where there is the slightest possibility of the acceptance of a note. At no time does a business man better enhance his credit than when during a period of depression he comes to time with his payments.

St. Louis Stove Trade.

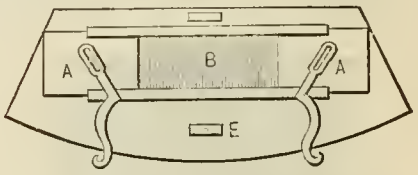
The stove trade is beginning to show signs of returning activity. The total number of stoves sold since January 1 will compare favorably with preceding years. The cutting of freight rates contributed largely to this end, and it is for this reason that stocks are not now abnormally large. During the past three months production has been curtailed very materially, only one foundry out of four running, and that one only three days a week. This reduces the production 87½ per cent., and as sales are nearly equal to those of last year, it can be seen at a glance that any unusual demand will rapidly deplete stocks. While the outlook could be better, yet it is more than satisfactory when the same period of last year is taken into consideration. At that time everything was muddled and it was impossible to choose the weak from the strong dealers. Now, however, it is radically different. Dealers who came through last year are in a position to weather almost any kind of a storm, and their credit is, in most cases, improved by their experience.

A peculiar feature of this season's trade is seen in the introduction of two styles of stoves which are creating more or less attention. They are the hot blast stove and the wood burning stove, known as the air tight heater. This latter stove has been on the market for two years past, but has never created very much attention until this year. The sale promises to be large and is generally conceded by stove manufacturers to be a good thing, as it will largely take the place of box stoves, which, it is stated, have long been sold at a loss to the manufacturers.

The hot blast stove is, practically speaking, a small furnace, which, instead of having the ordinary jacket of galvanized iron, is inclosed in a cast iron casing of elaborate design, which in appearance is as artistic as a base burner. The claim is made that these stoves are easily regulated, clean, economical in the use of fuel and will hold fire for 24 hours without attention. The hot blast and the air tight heater are dividing attention with the steel range, which is also a leader just now. The local makers are busy with new goods, which will shortly make their appearance in the catalogues issued by the different manufacturers.

Improved Regulator for Stoves.

A rather novel means of checking the draft in stoves has recently been brought to the attention of the English trade by an inventor named Tibbits. It is conceded that the ordinary domestic grate in use in England is far from perfect and that the appliance referred to tends to accomplish a great saving in the way of fuel. We cannot do better perhaps than to republish the inventor's description of the device, which in connection with the illustrations presented herewith will enable the reader to comprehend the construction and operation of the device:



Improved Regulator for Stoves.—Fig. 1.—Showing Regulator Open.

This invention consists of an iron plate the size of the bottom of the stove, with two doors running in slides, and opened and shut by levers. The plate is fixed underneath the bottom of the stove by the aid of two small screws and nuts, which hold it up to the bottom. When the doors are open (for lighting the fire or drawing it up) the levers or handles project slightly in front, as shown in Fig. 1 of the cuts.

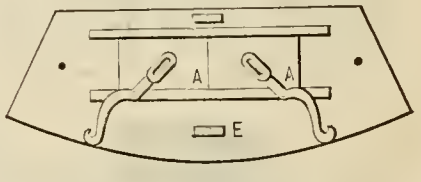


Fig. 2.—Showing Regulator Closed.

When the doors are closed (to obtain slow combustion) the levers or handles will be as far from one another as possible, and hidden under the bottom bar of the grate, as indicated in Fig. 2.

Referring to the illustrations, A represents the doors; B, the open space when the doors are open; E, the slot through which runs the screw which, with a nut below, fixes the plate to the bottom underneath the stove. Both figures show that side of the plate which when fixed will face the hearth.

Peoria Stoves

is the title adopted by Culter & Proctor Stove Company of Peoria, Ill., for their 1894 catalogue. This publication is a handsome volume of 88 pages, in the popular small size. It is bound in scarlet cloth, lettered in gold, and the edges are tinted in yellow. The pages have a half border, consisting of a red line, with the company's trade-mark at the upper corner. An introductory note calls attention to the special stoves and ranges enumerated in the catalogue, for which superiority is claimed in quality, finish and accuracy of castings, peculiar and perfect adaptability to the various fuels used in the West, and a number of other points. The most prominent position is given to the Peoria-Lexington six-hole range, intended for either coal or wood. It is shown in a number of styles—with high and low closets and reservoir, with high closet and reservoir, with high shelf and reservoir, with tea and pipe shelves and low closet and reservoir, with tea stands and reservoir and in square form with no accessories but tea stands. It is furnished in three sizes, is attractively designed and ornamented, and is offered as a first-class range in every respect. A four hole range, exclusively for soft coal, is also made under the name Peoria-Lexington, which is furnished in any style and in two sizes. A line of cook stoves, from entirely new and original patterns, is presented under the same name. They have flush tops and square ovens, are constructed on graceful lines with skirting and panels effectively ornamented, are especially adapted to soft coal, and are furnished in three sizes. Another line of soft coal cooks, in six sizes, is shown under the same name, at a somewhat lower price. The Wabash is an attractive but low priced coal and wood cook, made in two sizes. The Woman's Rights is a cheap coal cook in one size only. The Antelope range is a four-hole wood burner, made in all styles and three sizes. Antelope wood cooks are also shown in various styles and are furnished in four sizes. Heating stoves comprise, under the general name Peoria, several styles of all cast wood base heating constructions of the Todd type, but with special features of construction and draft covered by patent; a square hot blast base heater for wood; a square hard coal base burner, and a square soft coal base heater. Other heating stoves shown are the Challenger, a round surface burning base heater for hard coal or coke; the Model Peoria, a square hot blast ventilating parlor heater for soft coal; the Peoria Queen, a square stove for soft or hard coal, designed as a substitute for the oak style; the Peoria Oak, in a number of forms, to cover all requirements; the Oak Cottage, for coal and wood; the Black Hawk, a new cannon stove; the Chief, an extra heavy cannon stove; the Sprite, a two-hole dwarf stove, for coal or wood; the Sunbeam, for hard or soft coal, and the Empress, for wood. The company also manufacture Magee's patent kitchen sink and common sinks and carry in stock a complete line of ground and plain hollow ware.

Charles E. Coleman, representing Eugene Munsell & Co., 218 Water street, New York, is sending to his friends in the trade a miniature grip with a tag attached, and accompanied by a letter, the body of which reads as follows: "I send herewith my grip as a reminder that I will visit you in a few days. Kindly hang this up, and in the meantime do not complete arrangements for your fall line of goods until I see you. That's all."

ODD PLATES.

The gas manufacturing companies have affected the business of selling gas stoves in more ways than one. For the purpose of increasing the sale of gas they hastened the introduction of gas stoves, until they are now no longer regarded as an experiment or luxury, but as a standard article. The method of introduction has been to furnish a stove at so narrow a margin of profit that, without the profit received from the sale of gas the traffic would not be a paying one. If the interest created by this method of bringing the stoves before the public is not taken into account the method may be deplored, but it is generally considered that, in spite of the times, more gas stoves will be sold this year than in any previous one. This is largely due to the fact that there are a number of factories making gas stoves this year for the first time; a better stove being offered and generally at prices very much reduced. Owing to the financial depression the consumers are not buying as they otherwise would, and those factories which have a stock of new goods are making sales at low figures. The gas stove dealer gets a share of the orders, as many buyers do not care to have the gas company know a gas stove is being used. The dealer, while getting a better price, as a rule, than the gas companies, insists on buying at low prices that are unsatisfactory to the makers. It is urged that this reason, and the belief that there is still a large and profitable future for the gas stove, has induced several of the larger makers, holding a number of valuable patents, to consider the consolidation of their interests in one large company. The object, doubtless, is to save a large expense in selling the goods, as well as in producing them. Whatever may be the result of this effort it points to two things: the one being the faith that, in the near future, the gas stove will be more generally used; the other that, to both the maker and dealer, the present prices and sales are not such as make the business thoroughly satisfactory.

Notwithstanding the severe business depression which has prevailed all over the country during the past year the Favorite Stove & Range Company of Piqua, Ohio, have been making improvements with a view to increasing the capacity of their already extensive plant. Prominent among the changes which they have made may be mentioned the grouping of their nickeling, buffing, grinding and polishing departments in one large brick building especially erected for the purpose, thereby increasing fully one-half the size of their former mounting room. They have also completed the erection of a new boiler and engine house, fitting and equipping it with a large size Hamilton Corliss engine, with a battery of boilers and an electric light dynamo.

The "Journal of the Royal United Service Institute of Great Britain" records that during the last military maneuvers in Russia experiments were made with the Norwegian cooking stove, the object being to provide the troops on the march, within the least possible space of time, with warm food. The apparatus used was the ordinary camp kettle fitted into a thick felt covering. The soup or stew being placed in the kettle is raised to the boiling point and then removed from the fire, the lid clamped down, the kettle inserted in the sheath, and the whole slung in the usual manner below the wagon. The process of stewing continues automatically, thanks to the heat retained, and even after several hours' marching the temperature does not fall below 100° F.

The Favorite Stove & Range Company, Piqua, Ohio, have been getting out some new stove trade literature in the way of a handsome catalogue, copies of which are being distributed to the trade. This handsome publication has been carted to the post office in barrel lots at the rate of not less than two barrels a day, and at latest advices the work of distribution was not yet completed. This is significant when it is taken into consideration that the catalogues are sent only to customers whose names appear upon the books of the company. A review of this handsome volume appeared in these columns last week.

The Safety Furnace Pipe Company, Detroit, Mich., have kept their force busy making up their specialties for furnaces and the elbows, boots, register boxes, &c., for house heating during the winter. Their trade is steadily widening, recent shipments having been made to Los Angeles, Cal., and New Orleans, La.

The Eclipse Stove Company of Mansfield, Ohio, send us a package of advertising matter, among which is a little pamphlet of 40 pages containing testimonial letters from those who have used Eclipse stoves and ranges; a circular descriptive of the Eclipse Russia iron and sheet steel roaster and baker; a folder giving the shipping weights of various lines of stoves; another folder which gives directions for operating stoves and a catalogue relating to the Premier Eclipse six-hole range. The latter is a handsome construction of substantial appearance and embodies the modern improvements. It is made in several sizes, arranged for burning coal and wood and also for burning wood exclusively. The manufacturers refer to the flue construction as being of such arrangement and capacity as to give a full and free circulation.

L. G. Comparet, 314 Walnut street, Des Moines, Iowa, has brought out, in connection with a line of steel ranges, a portable oven made in two sizes. In making this line of ovens the intention has been to present a mode of construction which would meet every requirement of economy, durability and heating capacity. The body of the oven is made in two thicknesses of No. 27 galvanized iron, well riveted, double seamed and braced, and having a lining of heavy asbestos board. The flues are of heavy steel and the shelves are of steel strips riveted together. Mr. Comparet states that the ovens have been thoroughly tested in many of the leading bakeries, hotels and restaurants throughout the State of Iowa.

The Girard Stove & Foundry Company of Girard, Ohio, send us a copy of a catalogue and price-list which they have just issued, relating to the Adelbert stoves and ranges. This is the first catalogue which the company have issued, and in the announcement to the trade they give a few facts concerning their history. The Adelbert stoves and ranges, it is pointed out, are manufactured from the best quality of material, embody the latest improvements and are ornamented in an attract-

ive style. Numerous varieties are produced, several of which are illustrated. The leading cooks are the Adelbert Jewel, Adelbert Home and Adelbert Hayden. The heaters are represeuted with the Adelbert oak in the leading place. This is richly ornamented, has an all cast body and is well mounted and cemented. The Adelbert Cosy is a pretty Franklin stove, with circular fire pot, and adapted for burning hard or soft coal, coke or gas. Egg and cannon stoves are also shown.

THE MICHIGAN STOVE COMPANY favor us with one of their new portfolio pocket envelopes, intended for use in carrying papers. It is sufficiently large to hold legal documents. The Garland trade mark is visible on it, but nothing else in the nature of an advertisement of the company. On the inside of the flap is a table showing the population of the leading cities and another showing the population of the States. Blanks are arranged also for the insertion of identification details. Circulars have also been received from the same company referring to their specialties. One is entitled "Fact *vs.* Fiction," and is an array of arguments to prove that Garland stoves and ranges are not too high priced for certain markets, and that in fact there is no place in the world where stoves are used but that Garlands can be sold. Another circular illustrates and describes the Carbon Garland parlor heater, for soft or hard coal, and the Maple Garland base heater for wood. The Carbon Garland is described as a "parlor furnace" on account of its heating qualities, while the Maple Garland is offered at the request of numerous customers for a strictly first-class base heating wood stove. The wood burns upon the bottom instead of a grate, bringing the heat nearer the floor than if a grate was used.

THE WESTERN STOVE MFG. COMPANY, St. Louis, who have been closed down for some time past, will resume operations on July 2.

A OORY RED is the color adopted by Bergstrom Bros. & Co. of Neenah, Wis., for both the envelope and cover of a 16 page catalogue which they have just issued. It relates principally to the Elmhurst surface burning parlor stove. Reference is made to its beauty of design and ornamentation, heating capacity, economy of fuel, convenience, durability and medium price. It has been on the market for 12 years, yet has been often changed, always bettered, and this year it is entirely new in ornamentation and interior arrangement. Hot air flues have been added to increase its heating capacity. It has also full side and base flues, giving greater radiating surface, also a new device in the nature of a gas flue to consume the gas forming over the fire. Large sizes are made for heating halls and churches. Several pages of testimonials from enthusiastic users are printed. Some points are given with reference to the Royal Oak made by this firm. It also has a large air heating flue, and is constructed with a view to durability and practical value as well as ornamentatal appearance.

C. S. REYNOLDS & Co., Columbus, Ohio, have just completed a new line of cook stoves and ranges, which they are offering under the name Noonday. Two sizes are made for burning wood and two sizes for coal. The latter is offered with pouch or side feed and is furnished as a four or six hole range, made square and with or without reservoir. The company have also brought out a new cheap cook stove, intended for using coal or wood, and which is known as the Crystal Noonday. This is also made in two sizes, Nos. 8-18 and 8 20 being designed for coal and Nos. 8 20 and 8 22 for wood. The Noonday series are of the latest design, attractively decorated and embody the modern improvements.

THE RINOEN STOVE COMPANY of St. Louis, Mo., send us an illustrated circular of Quick Meal torches and lamps for gasoline, which are offered in several sizes. The construction of the Quick Meal torch is said to be simple, its flame bright and clear, and the device specially adapted for use in foundries, machine shops, factories, &c. The circular also illustrates the Quick Meal furnaces for gasoline designed for plumbers' and tinners' use, tailors' establishments, &c.

CHARLES D. SCOTT, successor to Weaver & Cheyney of 275 South Third street, Philadelphia, sends us circulars illustrating some of the goods for which he is sole agent. Among these may be mentioned the Warren five-hole brick set range and the Splendid fire place heater, both made by the Fuller & Warren Company of Troy, N. Y. We also have a pamphlet illustrating and describing the Automatic hot air furnace, which is made of both cast and wrought iron with a broad shallow fire pot, revolving grate bar and automatic damper, which regulates the draft of the fire by the expansion and contraction of a brass tube. This automatic damper, or governor, is fully described and illustrated, as is also the Weaver & Volkmar range, which is made in three sizes. Several pages of the pamphlet are given up to the names of customers who have for years been using some of these specialties.

J. B. BORDEN of F. M. Borden & Bro., Philadelphia, spent last week in Baltimore, doing a satisfactory business in gas and gasoline stoves and refrigerators.

A VAPOR STOVE comprising a low down tank, an expansion chamber having a burner cap with an induction tube extending across the center of the chamber, an initial burner separated from the expansion chamber by a shield, a fluid supply pipe leading from the tank, a vapor controlling valve and a separate valve to control the flow of the fluid to the initial burner has recently been patented by Henry Ruppel of the Dangler Stove & Mfg. Company of Cleveland, Ohio. In the present construction the inventor has done away with the necessity of pressure in the oil supply pipe, this being accomplished by the peculiar construction of the burner. This has, as the basis of the principle upon which it is constructed, means for expanding the vapor and air after passing into the burner, and consists of a mixing chamber or drum, which is entirely closed excepting where it is penetrated by the air and vapor supply tube and at its top, where it is covered by the burner cap. The tube passes very nearly across the drum, so that the commingled air and vapor therein, after entering in a cool state, is exposed to the radiated heat of the burner and thereby expanded, so as to produce an outward pressure through the burner cap. This, it is claimed, promotes a steady and even flow of vapor to the flame while maintaining a uniform pressure. A noticeable feature of the stove is that the oil is delivered practically direct from the tank to the burner by a most simple construction and without the intervention of anything to alter or affect the transmission of the oil except the exposure of the oil duct to the heat of the burner and the pipe for mixing the air and vapor.

TRADE REPORT.

The Iron Market.

The Coke situation continues very puzzling. It was expected that the men would return to work early this week, but they have not done so. One of the leading operators is quoted as saying that there will be some serious disturbances before the majority of the plants are again at work. The largest producer seems to be making no efforts comparable in earnestness with those during a similar contingency in former years. It is reported that this same interest is trying to buy some Coke and is also in the market for Bessemer Pig. Yet the same interest is supplying Eastern concerns with the required quota of Coke.

Rumor has it that Steel Billets from the Chicago district have sold for Cleveland delivery. Operators are acting conservatively, and are not offering the inducements to buyers which they would quickly do if the situation were fairly clear.

In the Wire trade the season is pretty well over, so that the demand for Rods and for Wire Billets will be light for some time to come. Rumors are afloat that a large German manufacturer has consigned a considerable quantity of Barb Wire to this country, to remain in bond in anticipation of the passage of the tariff bill, with its provision making Fencing Wire free.

Charcoal Pig Iron has drifted into a frightful condition. We understand that Lake Superior Car Wheel is being offered at $13.50, Buffalo, while Southern Iron has gone as low as $15, delivered, Boston.

Pig Iron.—In the New York market local agents report only a very moderate demand and complain that low prices continue to be made by some of the furnaces. Charcoal Iron has been selling at very low prices lately. Sales in this vicinity of Lake Superior Car Wheel Iron have been made on the basis of $13.50, Buffalo, while Southern Car Wheel has been offered at $15, delivered at Boston. We note below the result of the auction sale. There is still some demand for spot Bessemer. Ohio Irons are weaker. We quote standard brands $12 50 @ $13 for No. 1; $11.25 @ $12 for No. 2, at tidewater. Southern Iron, same delivery, $11.50 @ $12.25 for No. 1; $10.50 @ $11 for No. 2; $10 @ $10.25 for No. 3; $10.25 @ $10.75 for No. 2 Soft, and $10.50 @ $11 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is $9.75 @ $10.25.

In some respects the Philadelphia Pig Iron market is improving. There is plenty of Iron at quoted rates, but there is none to be had at concessions, and some brands are firmly held at outside figures. Averaging the market all around, it may be said that while it is very dull, the undertone of firmness is greater than appears on the surface, which would be quickly shown on the slightest indication of a better demand. At present things could hardly be more lifeless, but general quotations for Philadelphia and near by points remain about as follows:

Standard No. 1 Foundry X	$12 50 @	$13.00
Standard No. 2 Foundry X	11.50 @	12 00
No. 2 Plain	10 75 @	11.00
No. 1 Soft	11.50 @	11.75
No. 2 Soft	10.75 @	11.00

Sales of local Coke Iron in Chicago have been fully up to previous weeks. Agricultural implement manufacturers are placing their season contracts for Pig Iron freely, and there are plenty of others who have not yet covered their requirements. Prices might be expected to advance under these circumstances, but furnace companies are still sharply competing for business and this keeps values down to their old range. Southern freight rates are to be advanced 25¢ on the 1st and quotations are changed accordingly. A fair demand is noted for soft grades for quick shipment, but there is little inquiry for deliveries extending over any considerable period. Some of the large Southern companies have withdrawn from the market altogether and are not making quotations on any grades. Quotations are given as follows for cash:

Lake Superior Charcoal	$15.00 @	$15.50
Local Coke Foundry, No. 1	11.25 @	11.50
Local Coke Foundry, No. 2	10.50 @	11.00
Local Coke Foundry, No. 3	10.00 @	10.50
Local Scotch	11.50 @	11.75
Ohio Strong Softeners No. 1	13.00 @	13.50
Southern Silvery, No. 1	@	
Southern Silvery, No. 2	@	
Southern Coke, No. 2	10.50 @	10.75
Southern Coke, No. 3	10.25 @	10.50
Southern, No. 1, Soft	10.50 @	10.75
Southern, No. 2, Soft	10.25 @	10.50
Tennessee Charcoal, No. 1	@	
Tennessee Charcoal, No. 2	@	
Alabama Car Wheel	17.50 @	18.00
Jackson County Silvery	15.00 @	16.00

The Pittsburgh Pig Iron market is reported as extremely quiet, there being very little doing, either in spot Iron or for forward delivery. Foundry Iron is almost entirely neglected; consumers who heretofore bought in 100 and 200 ton lots now place their orders for a carload or two. In spite of the light demand prices are rather firm, there being little disposition to shade in order to get business. For deliveries during the next two or three months we quote as follows:

No. 1 Foundry	$11.50 @	$11.75, cash.
No. 2 Foundry	10.75 @	11.00 "

In Southern markets, as reported from Cincinnati, supplies of Foundry Coke Iron are so nearly exhausted that any one who has any Iron to sell can readily obtain an advance of 25¢ ℔ ton for No. 1 Soft, No. 2 and No. 3. The demand while not large exceeds the offerings, and quotations are not much better than nominal. There is more urgency than ever before to have Iron delivered on contracts long past due, and in fact in most cases such demands cannot be complied with. This throws current consumers on the market to buy what they must have. The demand, therefore, especially for No. 1 Soft and No. 2 Soft, is far in advance of the ability of the furnaces to supply. There is some inquiry for round lots of Foundry Iron, but as no one wishes to contract ahead no prices are made. The market is in a demoralized condition. There is no movement in Charcoal Iron. Quotations are as follows:

Southern Coke, No. 1	$10.25 @	$10.60
Southern Coke, No. 2	9.50 @	9.75
Southern Coke, No. 3	9.25 @	9.50
Ohio Soft Stone Coal, No. 1	14.50 @	15.50
Ohio Soft Stone Coal, No. 2	14.00 @	14.50
Lake Superior Coke, No. 1	12.50 @	13.00
Lake Superior Coke, No. 2	11.50 @	12.00
Hanging Rock Charcoal, No. 1	17.0 @	17.50
Hanging Rock Charcoal, No. 2	16.50 @	17.00
Tennessee Charcoal, No. 1	13.00 @	13.50
Tennessee Charcoal, No. 2	12.00 @	12.50
Standard Southern Car Wheel	16.25 @	17.00
Lake Superior Car Wheel and Malleable	16.25 @	16.75

Advices from Birmingham, Ala., indicate that sales have been quite brisk and shipments exceeded the make largely. There are but few grades to be had there One large concern have nothing but No. 1 Foundry on hand and ten days' shipments will clean them up. Nos. 1 and 2 Soft are very scarce, as are in fact all the lower grades. Higher prices are looked for inside of 60 days. Quotations range No. 1 Foundry, $8; No. 2, $7 @ $7.25; No. 3, $6.75.

Metal Market.

Pig Tin. — On market prices of Straits Tin there has been a decline during the week of nearly ¼¢ ℔ lb for delivery this month, July or August. Sales to consumers have not, however, been above a very ordinary average for this season of the year, and jobbing prices for small lots have ruled about the same as last week's quotations—namely, 20¾¢ @ 21¢ ℔ lb. Slow trade here and lower prices in London along with the large visible supply of the metal account in a good measure for the decline in wholesale prices.

Copper.—The market has remained extremely quiet. The demand from all quarters has been unusully slow, and hardly enough business has been done to fairly determine market values. Jobbers' prices for small lots of Lake Ingot remain unchanged at former quotations, but the cheaper classes are to be had at some concessions.

Sheet Copper. — The demand for Sheet Copper has shared in the extreme dullness which pervades the Metal trade generally. Sales have been below the average, and inquiries limited in volume. Prices remain steady at their former level.

Pig Lead.—The proposed reduction in duty on foreign Lead has prompted the offering of domestic at a slightly lower figure than last week's quotations. Little business is doing, however, consumers being evidently inclined to go slow in the matter of buying until the tariff is settled. Deliveries are somewhat backward, and that fact tends to strengthen the belief in recent reports of restricted production. Jobbers ask for small lots of American Pig from 3⅝¢ to 3¾¢ ℔ pound.

Lead Pipe and Sheet.—There is next to nothing doing in Manufactured Lead, inquiries and sales being alike confined to very moderate proportions. Prices were revised last week, and remain firm at the reduced rates.

Spelter.—Sales have been moderate. The demand has shown very little spirit, although probably better than during the fortnight preceding the week under review. A certain amount

of reserve in the offering was shown, the inference from which is that late reports of modified production have some basis. Prices are firm, the common rate asked by jobbers for small amounts of Western being 4¼¢ ₱ lb.

Antimony. — Dealings have been moderate, and prices are barely steady. For small lots jobbers' rates are about 10¾¢ for Cookson's and 10¢ for Hallett's.

Tin Plates.—The Tin Plate market has proved no exception to the rule of apathy which has characterized the Metal trade in general during the week. In the earlier days business was like that of last week—spasmodic and below the average for the season—but toward the end of the week it relapsed into absolute tameness. No improvement has developed in the demand for either spot or forward shipments. Consumers are pursuing the policy of the greatest caution in buying, and as a general rule order not a box beyond the exact quantity necessary to fill their current requirements. Reports of better values in the English markets have not affected the domestic market to any appreciable extent. Stocks of imported Plates in bond are ample for the present demand in nearly all lines. Prices remain almost stationary, but with rather soft undertone on spot goods.

A special London cable despatch to *The Iron Age* of June 27 reports as follows in regard to the British Tin Plate market: The demand for Coke Tin Plate has been moderately active, with good orders from 'Frisco at somewhat enhanced prices. Buyers and sellers are still so far apart that business is chiefly of a retail character. Ternes have been in good demand, but prices show no further change. Swansea prices are as follows:

Bessemer Cokes, 14 x 20	@ 10/3
Siemens Cokes, 14 x 20	@ 10/6
Ternes, double box	@ 13/
Charcoals	13/ @ 15/

Sheet Iron.—Notwithstanding the restriction of production in both Black and Galvanized Iron, owing to the closing down of many mills from lack of fuel, strikes, &c., the supply of Sheet Iron, except in the case of Black Sheets for tinning, appears to be fully adequate to the demand, which is reported as very moderate. Prices are still down to rock bottom and show, as yet, no rising tendency. Galvanized Iron in small lots from store is quoted at 75 @ 75 and 5 % off.

Chicago Report.

Scrap.—Dealers continue to quote the following list of buying prices, Chicago delivery:

	Per net ton.	Per lb
No. 1 Wrought Scrap	$7.00	....
Machinery Cast	6.00	....
Malleable Cast	5.00	....
Stove Plate (free of burnt)	4.00	....
Burnt Iron and Grate Bars	3.00	....
Sheet Iron and Hoops	2.00	....
Plow Steel and Breaking Stock	4.00	....
No. 2, such as Shovels, Hoes, &c.	3.00	....
Old Boilers—whole (Iron)	3.00	....
" (Iron)—cut in single Sheets and Rings	5.00	....
Old Gas-Pipe and Boiler Tubes	5.00	....
Cast Borings	3.00	....
Turnings	4.00	....
Horseshoes	8.00	....
Copper Bottoms	....	5⅛¢
Copper Clips and Heavy	....	7 ¢
Heavy Brass	....	5⅛¢
Light Brass	....	3 ¢
Pipe Lead	....	2¼¢
Tea Lead	....	2 ¢
Zinc	....	2 ¢
Rubber	....	3½¢

Anthracite.—Business is beginning to improve again. Carload lots of 12 net tons or over are quoted as follows:

	Grate.	Egg, Sto. and Ch
Chicago, Ill	$5.25	$5.50
Milwaukee, Wis	5.25	5.50
Kansas City, Mo	8.45	8.70
Council Bluffs, Iowa	8.45	8.70
Lincoln, Neb	8.60	8.85
Sioux City, Iowa	8.45	8.70
Aberdeen, S. Dak	8.50	8.75
Dubuque, Iowa	6.55	6.80
Madison, Wis	6.75	7.00
St. Paul, Minn	7.75	8.00
Burlington, Iowa	6.75	7 00
Des Moines, Iowa	8.20	8.45
Davenport, Iowa	6.55	6.80
St. Joseph, Mo	8.45	8.70
Leavenworth, Kan	8.45	8.70
Omaha, Neb	8.45	8.70

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$8.00
Pueblo	8.00
Colorado Springs	8.00
Leadville	8.00
Cheyenne, Wyo	10.00
All points between Denver and Missouri River	8.85

Trade Notes.

THE CANADIAN MINERAL WOOL COMPANY of Toronto, Canada, have secured a suitable factory at Dundas, Ontario, where they will have the necessary facilities for making the crude material which they have heretofore imported from the United States. The slag which they use will be brought from the Iron blast furnaces at Tonawanda, N. Y., until the blast furnace now being built at Hamilton, Ontario, is put in operation. The company are reported as enjoying a large sale for their mineral wool.

THE EXCELSIOR STEEL FURNACE COMPANY, 38 West Monroe street, Chicago, take up the subject of Register Flanges in their advertisement in this issue. Cuts are printed of both Square and Circle Top Flanges. These are made in all sizes and in both IC and IX weights. They are manufactured by special machinery built for the purpose and patented.

IN OUR ADVERTISING COLUMNS the Geuder & Paeschke Mfg. Company of Milwaukee, Wis., call attention to their line of Coal Hods, which they make in all sizes and styles, open or with funnels, japanned or galvanized and with gold bands or fancy decorations, as may be desired. The Hods have been entirely remodeled for this year's trade, are of pleasing design, very durable and are offered at prices which cannot fail to attract purchasers. All inquiries receive prompt and courteous attention.

It is reported from Boston that 300 acres on the Mystic River have been bought by New York capitalists, and that substantial docks will be built along the whole distance of the water front—1½ miles—where there is now a depth of 28 feet at low tide and of 37 feet at high tide. It is further rumored that the Nova Scotia Coal Syndicate will make the new docks their central depot for the United States.

The promptness with which the monthly statements of the imports and exports of the United States are now issued by the Treasury Department is much appreciated by the business community. The promulgation of early information on this subject adds much to its value.

CONDITION OF THE

Hardware Trade.

THE CLOSING DAYS of June are probably among the most quiet of the year, and, as is to be expected, the volume of business is light. Travelers for the most part are at home, some of them making arrangements to re-enter the field early next month. Merchants are as a rule buying only such goods as they require, and as a consequence both manufacturers and jobbers report business very light. Many of the factories are preparing to shut down for a time, as usual, in order to enable them to make repairs and improvements and get in shape for fall business. There is little to report in prices, the market being in substantially the same condition as for some time past. Collections are referred to as fair, though in some sections there is more or less complaint.

Advices from Chicago.—Trade in Shelf Hardware is not so active. Midsummer dullness appears to have made its appearance, and packing rooms are considerably quieter than they have been. No special changes have occurred in prices and no features of any special importance are coming up. Roofing plates are now in good supply, as importers have recently increased their stock considerably. Trade in Heavy Hardware has been good the whole of this month, but the past week's business was remarkably active. Small consumers have been buying very freely; orders have not been large, but numerous. The demand for wagon and carriage stock is steady and much better than usual, and many houses are behind their orders. It is worthy of note that in this line the demand is running to a better grade of material than ever before. Consumers are asking for better stock and superior finish and manufacturers and jobbers are obliged to comply with their wishes.

Notes on Prices.

Wire Nails.—The market in the matter of price is not entirely even. Some manufacturers are holding firmly at $1.10 for carload lots at mill, but others are making $1.05, and it is rumored that in some cases the latter figure has been slightly shaded. The demand is only moderate and the mills are beginning to close down. Small lots from store in New York are held at $1.25 to $1.30.

Advices from Chicago.—Manufacturers report trade quiet during the past week. A few orders have been influenced by the prospects of a general shut down of the factories on July 1, but merchants are not at all disposed to buy freely. Prices are maintained at $1.20 to $1.25, Chicago, for factory lots, while small lots are selling at $1.25 from stock.

Cut Nails.—There has been little change in the Cut Nail market during the past few weeks, and it is still represented by the quotation of 95¢ to $1 for carload lots, delivered on dock in New York, but during the past week the former figure has been made a little more freely than heretofore. Some relatively low quotations have been made by Western mills who are desirous of placing goods in Eastern territory, and this competition has the effect of weakening the market somewhat. Small lots from store in New York are held regularly at $1.10 to $1.15.

Advices from Chicago.—Prices on factory shipments have been increased

to 95 cents on a 55-cent average from the local mill. The manufacturers are doing a good business and not complaining of its volume, but Eastern manufacturers appear to be getting absolutely nothing in this field. The Lakeside mill is still shut down, but the compsny expect to start at an early day, ss soon as a supply of coal can be obtalned. Small lots from stock are quoted by jobbers at $1.15.

Barb Wire.—As usual at this season, the demand is light and diminishing. Prices, which of late have been a little uneven, show signs of increasing weakness, and slightly lower quotations are made. It is probable that attractive orders could be placed at lower prices than have recently ruled. We quote for Four-Point Galvanized, delivered at the points named, as follows: Pittsburgh, $2.05 to $2.10 ; Cleveland, $2.10 to $2.15; Cincinnati or Allentown, $2.25 to $2.30; Chicago or New York, $2.25 to $2.30.

Advices from Chicago.— Manufacturers have lately been accumulating stock, as they are now soliciting orders with gusarantees of prompt shipments. While trade is light, there has been no change in prices. Factories will generally shut down July 1, and consequently it is expected that they will be able to maintain quctations for some time. Jobbers quote small lots of Galvanized at $2.35 to $2.40, while carloads are selling at $2.20 to $2.25.

Enterprise Grater No. 93.—This article is put on the market by the Enterprise Mfg. Company of Pennsylvania, Philadelphia, Pa., for whom J. C. McCarty & Co. are agents, 97 Chambers street, New York. The Grater is sold at $3 list, subject to a discount to the trade of 20 per cent.

Juice Extractor No. 21. — Enterprise Mfg. Company of Pennsylvania, Philadelphia, Pa., for whom J. C. McCarty & Co., 97 Chambers street, New York, are agents, are putting this article on the market. It is sold to the trade at $2.50 list, subject to a discount of 20 per cent.

Monitor Aluminum Juice Extractor. — This Extractor is manufactured by the Sterling Aluminum Company, 1195 Fulton street, Brooklyn, who are selling it to the trade at $5 per dozen, net. The company are selling Glass Extractors of the same pattern at 85 cents per dozen, net. Referring to the use of aluminum in lemon juice extractors, the company advise us that they have recently received a letter from Prof. James W. Richards of Lehigh Universlty, in which he states that aluminum is a better material than glass for this purpose.

Ideal Dampers.—An illustrated description of these goods, which are a recent addition to the manufactures of the Stover Mfg. Company, Freeport, Ill., was given in our issue of 16th inst. These Dampers are sold to the trade at a discount of 50 per cent. from the following list:

4	4½	5	5½	6	7	inch.
$1.00	$1.13	$1.25	$1.38	$1.50	$2.00	per doz.

Glass.—The demand for Glass during the past week has not shown the activity anticipated by the manufacturers. Buyers are pursuing a conservative policy and purchasing only for immediate requirements, as the outlook does not justify anticipating the future. Glass factories not already closed down will discontinue operations on June 30 for the summer, and the opinion is expressed that the accumulated stock will be insufficient to supply the demand until fall. It is estimated that if the tariff bill passes in its present form foreign Window Glass can be imported at a discount of 88 per cent., and that the foreign article would then become a sharp competitor of American Glass. The general tendency of the market is still firm, Pittsburgh factory quotation being 85 per cent. discount. The demand for American Plate Glass is reported as encouraging at 70 and 10 per cent. discount.

Old Metals.—Business in Old Metals shows but very little more activity. Rather more inquiry for certain varieties of Scrap Iron is noted, and a few fair sales have been made, but they have not been sufficient to affect prices, which continue low. The following quotations represent about the current prices psid by New York dealers:

Heavy Copper	℔ lb	6¾¢
Light and Tinned Copper	℔ lb	6 ¢
Heavy Brass	℔ lb	4½¢
Light Brass	℔ lb	3¾¢
Lead	℔ lb	2½¢

Manila Rope	℔ lb	2½	@	2½¢
Jute Rope	℔ lb	1½	@	1⅝¢
Mixed Rope	℔ lb	¾	@	⅞¢

Old Rubber.—There has been quite a marked improvement in the market for Old Rubber in this section, and prices have advanced for some descriptions. Dealers' purchasing prices, New York delivery, are as follows:

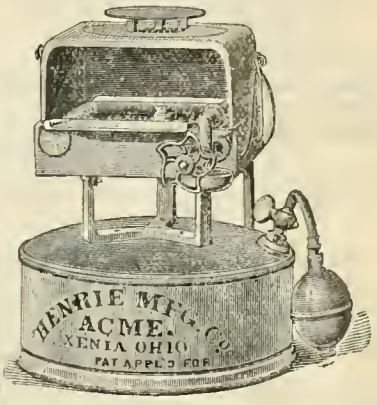
Car Springs, ton lots, ℔ lb.	@	$0.03½
Rubber Shoes, carloads, delivered at factory, ℔ lb.	@	.04⅜
Rubber shoes, less than carloads, ℔ lb.	@	.04
Large Hose, ℔ ton	@	15.00
White Wringer Rolls, ℔ lb.	@	.03¾
White Syringes, ℔ lb	@	.03¾

Overhead electric wires in the crowded parts of Boston have been ordered down and to be placed underground. This order affects the street railway, telegraph, telephone and electric light companies, who are given until November next to complete the work.

It is reported that the New Hampshire Legislature will consider a proposal to build an electric road through the entire length of the State, beginning at Haverhill and terminating at Quebec, Canada.

Gasoline Soldering Furnace.

The Henrie Mfg. Company, Xenia, Ohio, are introducing to the trade an improved gasoline soldering furnace, shown in the accompanying illustration. Among the especial features of merit claimed for it by the makers is that the needle point is so guarded and arranged that draft cannot blow the gas away from the mixing chamber. It is also pointed out that it has what is termed return burners, which burn equally on both sides of heating chamber. Furthermore, its construction provides exceptionally large space for heating, and is especially adapted for cross seam or bottom irons on this account. For plumbers' service it is arranged so that no additional expense is necessary for hood or other device. When it is desired to melt solder a movable cap and loose ring are removed from the top of the heating hood and the pot placed thereon. The cast iron return burners



Gasoline Soldering Furnace.

are so arranged that solder cannot clog them, while they burn from both sides evenly, the flames meeting in the center, producing a very hot fire. The furnace will melt lead and heat coppers at the same time, the burners being large enough to heat three irons at once.

The members of the New York and New Jersey Bridge Commission, recently nominated by the President, held their initial meeting in the Army Building, New York, on Monday. The commission is composed of the following members: Major C. W. Raymond of the Corps of United States Engineers; Theodore Cooper and Prof. W. H. Burr of Columbia College, New York; George H. Morrison, Chicago, and G. Bouscaren, Cincinnati, Ohio. Major Raymond was elected president of the board and Mr. Cooper secretary. Charles Swan, secretary and treasurer of the Bridge Company, appeared before the board and presented the bridge plans, which will be taken into immediate consideration by the commission, whose first duty will be to determine the length of the new bridge's span.

United States Consul-General Ramon Williams, at Havana, reports to the State Department that a cablegram received there from Madrid states that the budget presented to the Spanish Cortes by the Colonial Minister of Cuba, to go into force on July 1, imposes a temporary import duty of 24 per cent. on all articles of American production now exempted by Schedule A of the reciprocity agreement between Spain and the United States.
